DANGER AT THE GRAVE.—The *London Telegraph*, in speaking of the danger of uncovering the head at the grave on the occasion of a funeral, says: Many of the distinguished and more elderly mourners at the interment of the Duke of York died from bronchitis within a few weeks of the royal obsequies: the Marquis of Londonderry's funeral in Westminster Abbey in 1822 was equally disastrous to the aged or delicate among those who gathered round his tomb; and the funeral in Pere Lachaise of the celebrated French juriconsult, M. Robert de St. Vincent, is said to have decimated the senior ranks of the Paris bar, one of the victims being Brillat Savarin, the author of the "Physiologic du Goat."

DANDRUFF.—Dandruff is a disease of the scalp and a very common affection. The causes are numerous. It may arise from want of cleanliness, infrequent brushing with a soft brush or too much brushing with a hard one, poor health, a dry scalp, wearing a close, unventilated hat, the use of a fine-tooth comb, an instrument which ought to be banished from the toilet. Avoid these causes and keep the head clean, and the disease will generally disappear.

DIED FROM EATING WILD PARSNIPS.—The *Boise (Idaho) Democrat* says a man named Peterson, who was in the mountains getting out timber, roasted and ate a lot of wild parsnips, and in an hour afterwards died in great agony.

EAT SALT WITH NUTS.—Always eat salt with nuts. It renders them easy of digestion and greatly improves their relish.

Our Mineral Resources.

(CONTINUED FROM PAGE 139.)

which are comparatively virgin, our gold quartz mines are rapidly being developed with a constantly increasing yield. The large proportion of this class of mines are worked by close corporations, and it is difficult to ascertain their output and net results, as their business is never published to the outside world, owners being satisfied with the mines that they own as investments and not for sale.

Where the conditions are favorable, large ledges of low-grade gold ores can be profitably worked in California. A multiplicity of stamps, modern improvements and gravity for handling ores and water power are all the requirements. The most notable instance is the Melone mine, in Calaveras county, owned by Grayson and Borland. The vein is 100 feet in width. It is worked by an open quarry and a 40-stamp mill crushing three tons to the stamp. The ore pays \$1.60 per ton; the expense for mining and milling is 90 cents per ton, leaving a profit of 70 cents per ton. The owners contemplate erecting 100 more stamps which would crush 12,600 tons per month, leaving a net profit of \$8,820—that is, providing Sawyer, Cadwalder & Co. do not object and enjoin the work.

Silver.

Notwithstanding the celebrated Comstock ledge of Nevada has ceased to be prolific other than in a small way, Nevada has many other districts that are coming into notice as prominent producers. A large extent of country is on the line of the Carson and Colorado Railroad, comprising the districts of Lyon, Churchill, Mono, Esmeralda, Inyo and San Bernardino counties—particularly the last three named. The mines of these counties have hitherto, owing to their inaccessibility and remoteness from a base of supplies, through the want of railroad facilities, been laying idle or feebly worked.

Inyo county of California, contains prominent mines of both gold, silver, silver-lead, copper, sulphur, salines, deposits of borates, soda and common salt in immense quantities. The district of Cerro Gordo has formerly been a large producer of silver-lead. It has been estimated that \$1,500,000 of values has been taken from this district alone until 1872, when a cessation of work occurred from litigation, which is now settled, and the mines are being rehabilitated and producing. The Keystone group of gold-producing mines at Beveridge district have produced over \$300,000 in the past thirty months, and is still in bonanza. Lookout and New Coso districts are steady producers of silver-lead, with many other localities of note in this and San Bernardino district. Arizona, New Mexico, Oregon, Idaho, Wyoming, Utah, Colorado and Montana are steady producers of both gold, silver, lead and

Copper.

Of this metal and its products until recently we have been large importers, and dependent on a foreign market for our supply. In 1845, we produced only 100 tons; since that time our production has so rapidly increased that within the past twelve months we have entered the markets of the world as exporters and regular contributors. Great Britain is the great center of the copper trade, and has hitherto made and controlled the market without competition. But at date the United States has become an important factor, and at any time if disposed can advance or depress the market, as her resources are almost unlimited and supply inexhaustible. The production of copper in the United States from 1845 to 1883, inclusive, has increased from 100 tons to 58,000 tons per annum, at an estimated valuation of \$17,000,000, of which we have exported at least 15,000 tons for the year 1883. The highest price paid for lake copper for the past nine years, has been 25 cents per pound; the lowest, 14; the average, 19 cents per pound. From the rapidly increasing consumption of this metal in the arts, there can be but little doubt but what it has touched its lowest point and an advance is in order; as, as the minimum price stated, this metal can only be profitable produced by mines favorably situated in reference to railroad transportation, and a free smelting ore of high grade (carbonate and oxide) with other conditions in keeping.

However, fortunately for this industry, we have mines so situated that give promise of a long lease of life, some of them being successfully worked while others are lying idle, and have not as yet even erected a smelter. A case in point is a mine that the writer recently visited in Santa Fe district, Esmeralda, Nevada, within a few miles of the line of the Carson and Colorado Railroad previously alluded to. This district is extensive, comprising an area twenty miles in length by ten in width, and is essentially a copper district and belt. The most prominent and noted mine is the

Copper King.

Though but little developed there has been sufficient work done to form a very correct estimate of its great value and wonderful richness. The vein shows a width of 100 feet, and exposed on its line of strike for 1,500 feet, and so favorably situated that it can be worked for years by open quarry. The ores are oxides, carbonates and silicates, entirely free from arsenic, or antimony. They carry their own fluxes and will give an average assay of from 15 to 18 per cent as taken from different parts of the lode. Estimating them at 12 per cent, they can be reduced to black copper and transported to a

market at a cost not to exceed 8½ cents per pound of metal produced. At 15 per cent, a much less figure, which is worth at current rates in New York 13½ cents per pound, netting a profit of over 100 dollars per ton.

Of this class of mines, the Copper Queen of Arizona ranks as a heavy producer. Their ores range from 13 to 16 per cent (carbonates and oxides). This company has paid in dividends over one million dollars to date. It costs them to produce copper from 9 to 9½ cents per pound. This mine has a bright future with large reserves. Of the Lake Superior mines, the Calumet & Hecla is the most prominent and the largest producer in the United States—the average cost of production does not vary much from 7 cents per pound. This branch of mining has met with extraordinary success, as evidenced by the following data. The North Western Mining Journal is authority for the following statements:

Lake Superior Mines for 1882

	Capital.	Dividends.
Atlantic.....	\$ 180,000	\$ 80,000
Calumet and Hecla.....	1,200,000	2,000,000
Central.....	100,000	50,000
Oceola.....	880,000	250,000
Quincy.....	200,000	520,000
	\$2,560,000	\$2,900,000

For 1883 the yield was fully equal to 1882. Since the commencement of mining operations the above named companies have paid dividends aggregating \$28,140,000, or nearly eleven times the amount of their full paid up capital.

Lead.

The extension of our railroad system serves to constantly open up new districts that come forward as producers. Our output of this metal has not reached its maximum, and from present appearances we shall soon be again exporters.

The production of the United States from 1825 to 1882 inclusive, as computed by Whitney & Caswell, has been 1,589,580 tons; the highest price since 1875 has been 6.75 cents, per pound; the lowest 2½ cents per pound. The average for 1882 and 1883 was 4.46 cents per pound. At 4½ cents per pound foreign lead cannot be brought into competition with the domestic article. Lead producers should guard against over production and produce no more than our consumption demands.

Quicksilver.

The production of California for 33 years, ending Dec. 31, 1883, was 1,310,678 flasks of 76½ pounds each. During that time we have exported 934,233 flasks. California's production for the year 1883 was 47,000 flasks, of an estimated valuation of \$1,215,000, of which the New Almaden mine produced three-fifths, 29,000 flasks. Other mines produced 18,000 flasks. The world's production for 1883 was 115,000 flasks (from Spain, California, Austria and Italy). The mean price in California for the past two years has been 36½ cents per pound. The approximate value \$2,713,963. Previous to the discovery of quicksilver in California, that great financial power, the Rothschilds, of London, held the monopoly of this product, obtaining their supplies from the Almaden Quicksilver mine of Spain, by virtue of a \$110,000,000 loan made by them to the Spanish Governor, the interest sinking fund to be paid in quicksilver. This mine having been the principal producer of this metal in the world to date of its discovery in California, they furnished and regulated the supply and price according to the demand.

Young and mercantile America, by their large output, stopped their little game and made a barometer and thermometer of their own, reducing the temperature of the market from \$1.50 to 34 cents per pound—a price so low that there remains but very little of any profit for the producer. Our mines have been prolific, but we are simply working for glory and stubbornness, exhausting our supply without adequate compensation. Many of our mines have closed down. This industry could be made profitable and remunerative to all by a combination regulating the supply to the demand. It has been often attempted, but conflicting interests on the part of the producers as often prevented it. Rule or ruin, has been the law. In 1879 the writer visited New York, representing nearly all of the outside producers, for the purpose of effecting a consolidation of these great interests on a compromise basis of keeping the production within the limits of the consumption and a regulated scale of prices. But the scheme failed, as the principals of the principle producer—the New Almaden—did not see fit to join the coalition. They are now masters of the situation, the weaker having been compelled to retire and close their mines. The tariff does not protect this industry, it should be increased, to be of any benefit, to at least 20 cents per pound—it is now 10 per cent ad valorem.

Coal.

The United States is second only on the list of coal producers of the world, new beds or fields being discovered and old ones still prolific. Our coal area is rapidly increasing. The time is not far distant when we shall have reached a point when our annual output will not be surpassed by the oldest and most favored producer of this indispensable mineral. Already the area of our coal beds is larger than any other known in the world.

Iron.

The extraordinary rapid strides that we have taken in the development of this important industry, within the past 20 years, is a remark-

able feature. At date we are second only to the principal producer of the world—Great Britain—and still our production is not yet large enough to meet our requirements. Our imports from other countries are a heavy item. Our constantly increasing railroads, spanning and gridironing our possessions, are still heavy consumers. We are yet in our infancy, and our requirements great, notwithstanding our immense beds, deposits and veins of all the varieties of ores of this metal to draw from. We consume faster than we produce and are consequently steady and heavy importers.

Petroleum and its Products.

We imported for 12 months, ending Dec. 31, 1883, 533,134,100 gals., its value \$47,761,626, with the whole world for a market, our importations last year being the largest ever known, the result being that foreign markets have accumulated large surplus stocks. Our production was considerably less than the year 1882. California is not only a producer in part supplying home demand with illuminating oil and lubricants, but we are exporting to a limited extent with a constantly increasing production. Our oil producing area is large and being rapidly developed. In the four great staples of lead, petroleum, quicksilver, borax, soda and other saline and alkali products, our production has been so great and the sources from which we draw our supply so large and apparently inexhaustible that we have to a great extent completely revolutionized the market values of the world and are largely masters of the situation.

In connection with our oil fields, their apparent extent and promising future, we are forcibly reminded of Prof. B. Silliman's report on the values of these lands nearly 20 years ago. At that time, however, the precious metals in California were the rage and oil was let severely alone, and some of the Professor's friends thought him over sanguine. We are astonished at the extraordinary accuracy with which his report on the Bodie mines has been verified—at that time there were no prominent mines opened there and Professor Whitney and his corps of experts examined and pronounced the formation non-metaliferous and that values to any extent could not exist in so forbidding a formation. Time, however, sometimes produces great changes and it is possible oil has accumulated, and that the enormous yield of the Standard and Bodie have grown since Whitney examined these districts. NMAN.

Prejudice of English Miners.

Mr. Geo. G. Andre, in one of his series of "Continental Colliery Notes," published in the *Colliery Guardian*, says: "The greatest obstacle to progress is prejudice, and it is an unfortunate fact that prejudices are more deeply rooted in Englishmen than in any other highly civilized people. This truth has been impressed upon me in my journeyings to and fro among the various mining communities of Europe. The difference in this respect is unpleasantly apparent; and the contrast becomes more striking when we travel westward to the United States of America. It is extremely difficult to induce the English miner to modify his practice even in a small degree, whatever the advantage may be that is to result from the modification, and utterly impossible to persuade him to make a radical change. But this peculiarity places him at a disadvantage with the foreign producer, who is not only ready to adapt his practice to the exigencies of the times, but who is ever on the look-out for means to enable him to get the better of his competitors in the market. The Americans—to whose enterprise and inventive genius the world owes so much—have discovered this weak side of the English character, and they are, in consequence, taking their inventions to other countries first. I met an American a few days ago traveling to the Continent with some important improvement in mining machinery. "Why do you not offer it here?" I asked. "Just this," he answered, "if I were to stop and offer it to your people here they would not look at it till about the time my patent rights came to an end, in twelve years' time. It is too much a change for their conservatism to get over in much less time than that. That's my experience of your mining people, anyhow."

DECOMPOSITION OF THE CHROMATE OF IRON.—The decomposition of the chromate can be done with fused hydrate of potash or chlorate of potash in a silver crucible, extracting with water, heating of the exsiccated residue, extracting the iron oxide with hydrochloric acid and reiteration of the decomposition process in the same way. The estimation of the chromic acid is done by letting the potassium chromate solution run in an acid solution of ferrous sulphate, and reiteration with potassium permanganate. A good silver crucible can stand about one hundred decomposition processes.—*Fresenius Zeitsch.*

PERHAPS the most forlorn and uninviting village in Nevada to-day is Grantsville, in Nye county. The mines for which the town was built are all idle, and many of them abandoned. The few people who remain exist by the hardest work, and, Micawber like, are waiting and hoping that something will turn up. There are few sights more deplorable than the wreck of a once flourishing mining camp.—*Reno Journal.*

Bodie.

(From our Traveling Correspondent.)

The famous bullion producing district of Bodie, Mono county, Cal., after a partial subsidence in the blow, or rather a diminution in its quantity of bullion output, is now beginning to attract marked attention, even across the continent. A month since, the secret barely got out to the community here, as a published fact, but for several months previous a few on the inside of the mine, and their special friends, were aware of a very rich strike, and very cautiously covered it up and pushed on the prospecting to make more certainty of the extent of the bonanza they had struck. The results were so very good, that their anxiety to secure large amounts of stock, and the telegrams in that line of business poured into San Francisco so rapidly that the officials, and stockholders, soon suspected something had occurred and investigated the internal workings of the mine, to see if the reportings had not been too meager, if not radically defective. President Levitt hastened up, and probably sent back a telegram letter—"I came, I saw, I conquered" the situation; and we will soon re-open the hidden veins—and when all things are ready, we will slaughter the fatted calf, and astonish the world with a boom for Bodie such as the former, only much larger."

The mine is open only to those holding special permits. Those who have seen this rich ore body, and also saw the one that caused the former boom some years since, say this is larger and richer. The community here seems to be a unit on the matter of the strike being a great and promising lead of rich silver and gold bearing ore.

Some who sold Bodie stock just before the general public became acquainted with the facts, for less than fifty cents a share, are now investing at very much higher prices.

Yesterday was one of severe storm, snowing and drifting, but it did not prevent even females facing the elements to gather up their fragments of hoarded gold dust and to convert all available into cash or hawkable shape, and hasten to the hawk for Bodie stock. One boarding-house lady is reported to have 1,000 shares, which she secured at low rates by getting points very early and using them. At this moment I hear in the next room the usual salutation, "How is Bodie to-day?" The lady's reply is prompt, for she is a Bodie stockholder, who keeps well posted on the hourly fluctuations in the stock, and has the fullest assurance of its reaching \$20 soon.

Through the courtesy of Superintendent Wm. Irwin I was permitted to visit the mine to the 500-foot level, and see one large body of milling ore, that appeared to be two large veins at their junction; but this was not the rich strike causing the excitement, though it may prove to be of greater permanent value. I also saw one cut or upraise cutting through a very rich vein of silver ore and above that, and near the hanging wall was a stratum of ore, from one to two inches thick, with gold visible. This strike of rich ore in connection with a large mass of good milling ore that constitutes the full ledge at this point of cutting, is ample to assure an actual value to the stock—but the real Bodie strike probably on another level, I was not permitted to see. To give an idea of the thorough discipline of the foreman and operatives employed now in the Bonanza mine, I was not allowed to bring away even a piece of wall-rock—and the really gentlemanly foreman assured me that it would be his grand satisfaction to select for me the choicest specimens of the mine if he could read just such an order from the office. Personally he would not have the least objection to answer questions, as to the richness and extent of ore deposits, or to my taking ore samples across the ledge for assay test of value of the ledge, but he was simply acting under restricting orders, and I fully appreciated his fidelity and his courtesy; and saw enough of the mine to show some good cause for a big rise in Bodie. The lower levels I did not visit; understood that for the present they will not be freed from water, but larger forces placed in the upper works where in several places good ore can be taken in large quantities. Many of the miners were taken from the old Lent Shaft and employed in this bonanza portion of the mine. The ore is now being brought to the surface.

The Snow Track

Is being broken to the mill, and the sacked ore hauled and milled—not apparently for any sensation, but for a regular output of the milling ore—which, to all appearance, is ample for the 10-stamp mill for many years to come.

These 10 stamps have been doing something previously along—as I noticed on the 28th of January, when in their assay office 3 bars Bodie mine bullion, worth \$2.55 per oz., or \$10,654.55; of this value \$5,371.25 was gold.

MR. JOHN HAYS HAMMOND, M. E., of this city, is just now in the central portion of the State of Cal., in the U. S. of Colombia, where he has gone to examine some mines. He will, early in March, be in this city, en route East.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

SUTTER CREEK.—*Cor. Amador Sentinel*, Feb. 13: The mining outlook is very favorable here now. Mr. James Morgan has been in town for the past few days trying to buy the liens on the Mahoney mine for 50 cents on the dollar. I understand that he has met with great success and that he has got almost all the men to accept with the exception of a few; so things look as if we will hear the sound of the whistle before another week rolls by. We are under the impression that if Mr. Morgan gets the place he will be able to make a good paying mine out of the Mahoney. The Lincoln hoisting works are finished and the shaft is all timbered and the cleaning of the shaft out will be completed by the middle of the week, when they will start the mine in full blast. The fitting up of the Lincoln mill is in progress now. It will need considerable overhauling and repairing. The Iowa Mining Co. are making some very extensive improvements on their mining claim and they will be running in full blast in about two weeks, and the sound of the little pick will turn out the precious metal under the able management of Supt. John Tucker, who has been connected with the mine for the past few years.

SOUTH SPRING HILL.—*Amador Ledger*, Feb. 16: The first cleanup of the Talisman mill, running on rock from this mine, was made on the 24th of January, and exceeded the most sanguine expectations. About 250 tons were crushed, and the yield averaged \$30 a ton in free gold, without sulphurets. The gold bar was shipped direct to the owners in Boston. The mill is still running, but will probably have to shut down temporarily, as the supply of wood is not sufficient to enable it to run through the winter. The mine is looking splendid; indeed, everything indicates that it will prove one of the foremost mines of the county. There is plenty of rock, enough to keep a mill of double the capacity of the Talisman constantly at work. The ledge has been followed 100 ft., varying from two to eight ft. in thickness. It is a noteworthy fact that the ore-body runs in a south-easterly direction—right into the heart of the company's ground, as the shaft is located at the northern extremity of the South Spring Hill claim. Another favorable indication is, that the stringers of quartz seem to go down, creating the impression that the ore chimney has been struck at its apex, and that all the quartz veins will form a junction at a greater depth. The mine is not in a position at present to be worked to advantage as a gold producer. A second shaft is a necessity for convenience as well as safety. Located southeast of the present shaft, it would enable the rock to be run direct to the mill, doing away with hauling.

MISCELLANEOUS.—J. B. Pine has made a promising strike on the north fork of the Mokelumne river, toward the head of the Amador canal. At a depth of 60 ft. he has met with a ledge 10 inches wide, and widening as it is followed deeper. The rock will pay all of \$120 dollars per ton. Jeff Boxall, one day last week, picked up in a small gulch near Jackson a chunk of gold worth \$6.

SUTTER CREEK.—*Amador Dispatch*, Feb. 16: The future business prospects of our sister town of Sutter creek are much brighter now than they have been for some time past, owing to a revival of the mining interests in that vicinity. Work has already been resumed at the Lincoln mine, and satisfactory arrangements have been made by which operations will also be resumed on the Mahoney and Wildman mines in a few days. The shutting down of these mines has made business quite dull in that place for several months past.

El Dorado.

THE INDEPENDENCE MINE.—*Mountain-Democrat*, Feb. 16: A. A. Gignac has been down from Grizzly Flat the past week, and reports a rich strike in the Independence mine, near Brownsville. If the statements made by Gignac are correct, and we believe they are, the mine is looking far better than we had expected it would at this time.

Los Angeles.

SOMETHING ABOUT OUR PLACERS.—*Los Angeles Herald*, Feb. 16: It has been several years since the output of placer mines has been so satisfactory as at present. Placer flake, scale and shot gold is being sent to the city very often from various auriferous canyons, to our merchants and bankers, who buy it and send it to the mint in San Francisco. In some of the canyons land-slides, which have occurred during the heavy mountain rains, have developed rich pay dirt where it had never been prospected before. These new discoveries are not only rich, but are easily worked, and the gold brings \$18 an ounce. The Placerito canyon sends in a good deal of gold, being one of the oldest and best prospected canyons which has not been entirely worked out, and appears to be as profitable as ever, especially in wet season. The Piru, the canyon where gold was first discovered in the State in 1843, is still profitable and also contains gold quartz ledges, which are worked by arastras, propelled by both horse and sand power. The San Francisco canyon, which is very lengthy and extensive, although large quantities of gold are being constantly taken out of it. The reason is that the Tehachapi stage road has always run through it, up to Turner's Pass, making it so accessible that it was worked out more rapidly. There is plenty of water this year in the immense Sierra Pelon valley, north of Mt. Parkinson, and south of the Sierra Pelon range, although no reports have yet been received from there this season. There are quite a number of prospectors and miners there at work, however. By a trail over the mountains south, Lang is the nearest station on the railway, but by team, Alpine is the nearest. There is a good deal of gold obtained from the San Gabriel canyon, both by sluicing and the hydraulic process. There is also gold and silver quartz in the canyon, which are not worked at present. For about three years past there has been a yearly output of about \$100,000 taken out from our auriferous sand, and yet they seem as profitable as ever. The output this season, which is so favorable, will likely reach \$150,000 or more.

GOOD CHANCE FOR PLACER MINING.—*Los Angeles Miner*, Feb. 16: The heavy rains and cloud-bursts in the mountains have stirred up the prospec-

tors, as it is reported that the washes have disclosed the "color" in a number of canyons. A party, well equipped, left for San Gabriel canyon yesterday, and others will shortly follow. Numerous rumors have reached the city of rich finds, but none have as yet been confirmed. It is certain that this will be one of the best seasons for placer mining in the history of Southern California, owing to the abundant supply of water.

Nevada.

DITCH BROKEN.—*Foothill Tidings*, Feb. 12: The Idaho company received word yesterday that the South Yuba Company's ditch had broken a few miles below Quaker Hill, and that it would be several days before repairs could be made. Messrs. Coleman inform us that the break in the ditch will not cause any delay in the work of the Idaho, but will necessitate the use of steam in some places about the works. There is water enough in the Idaho Company's reservoir to last for several days yet.

LACK OF WATER.—*Nevada Transcript*, Feb. 16: The South Yuba Company less than two weeks ago were able to obtain about 10,000 inches of water from the river, but owing to the cold weather that source of supply is now cut off and they are compelled to draw from Fordyce. There is not more than fifteen ft. in the lake, and the ditches and flumes are so choked with ice that it is almost impossible to get enough down to this point to furnish the quartz mine here with power. A few days of moderate weather will make everything all right again; but it is something unusual for the company to be compelled to tap the main lake for water at this time of year.

Placer.

RICH GRAVEL STRIKE.—*Foothill Tidings*, Feb. 12: A company who are mining at Alta station, on the line of the Central Pacific Railroad, have made a rich strike in the bottom of their shaft. At the point where the parties are mining several channels are supposed to come together. The shaft is 195 ft deep, and the quartz gravel from the bottom of the shaft pays \$3 to the bucket-full. The gravel is 13 ft high and 30 ft wide. Immense wealth, it is supposed, will be taken from this bed. The Supt. of the Alta mine, at Virginia city, is the principal owner in this.

TWO OPHIR MINES.—*Placer Argus*, Feb. 10: Mr. R. B. Symington, formerly of Ophir, was there last week arranging about the sinking of the Good Friday shaft. A start has been made and work will be carried on till a depth of 220 ft is reached or 50 ft more than the present workings. Large sums have been taken from this claim (more than \$100,000) and yet very little work has been done; no explorations have been made further than 200 ft westerly from the shaft. The mine was located for copper and when gold quartz was discovered by another party tedious litigation ensued and prevented the development of the claim. Both these titles are vested in the present owners and three-fourths of the mine belongs to Messrs. Spring, Ferguson and Handy, who are now working in the shaft. There is a 32-foot overshot water wheel and an eight inch pump by which the shaft can be sunk 500 ft if desired. At that depth it is expected that the series of parallel ledges pitching at various angles will have converged and formed one main ledge. The gold is free-milling and coarse, and has hitherto been found in pockets, but these pockets have been numerous, and in Tuolumne county and elsewhere it has been proved that this class of veins may be very profitable and systematically worked. Messrs. Symington and Ferguson are also interested in a mine of a very different character near Ophir. This is the Kirkland claim lying south of the village. Many trials have been made on this ledge which is one of the largest and most highly mineralized in the county. The mistake hitherto has been in treating the ore by the ordinary free-milling gold process, there being no other kind of mills in the district, while the ore contains carbonate of silver and gold bearing sulphurets, all of which were lost. Notwithstanding this Wm. Buttes manages to make the rock pay in a small way with a very primitive five stamp mill erected on an extension of the Kirkland claim. Mr. Symington proposes to open this claim by sinking a shaft 100 ft and running a level 300 ft along the ledge and expects that this will so expose the valuable character of the ore as to induce parties of sufficient capital to join him in erecting works suitable for its treatment.

Plumas.

SPLENDID QUARTZ.—*Plumas National*, Feb. 19: A splendid specimen of quartz from See & Jolly's Splendid Specimen in Granite Basin, has been added to our cabinet this week. It shows free gold in hundreds of places, and besides is filled with fine-looking sulphurets. The boys have a nice little property down there, and go steadily along, making it pay all the time. The specimen is from a portion of the ledge just opened, and said to be richer and better than any heretofore developed. We have never lost faith in Granite Basin, and confidently expect to see it one of the very best mining districts in the mountains at no distant day.

HALLSTED LEDGE.—*From Mr. A. D. Hallsted*, who came up from the East Branch on Sunday, we learn that the tunnel is progressing steadily on their ledge, and the vein shows large and in good shape. Where the tunnel cut the ledge it proved hard, but only for a few ft, and as the drift progresses on the vein it shows softer and prospects first rate. It was eight ft across it when the tunnel tapped it, but no crosscut has been run since the drift started. The side drift is now about 30 ft in length, and will be continued for some distance. The owners are highly pleased with the showing and feel confident that the Hallsted mine will prove everything that was expected of it.

San Bernardino.

AROUND CALICO.—*Cor. Los Angeles Herald*, Feb. 14: The reports from all the mines now being worked in and around Calico, are most promising. Also from the Lava Beds I hear reports of rich strikes. The troubles in connection with the Alford mine, near Camp Cady, I hear are about to be amicably settled, when work will be resumed at that place. At Ord but little is being done just now, but I believe that work will be started up on some of the mines in a few days, or as soon as the weather is sufficiently settled to get supplies in. It is now currently reported here, and on good authority, that Col. Olmstead, from Colorado, is about to establish sampling works at his place. He has secured a lot at the east end of town, near the railroad track, where he will locate his business. This is a good move in the right direction, and one in which every

one in this section takes a deep interest. It will be a great benefit to this whole section of country, and if properly constructed, will build up a large business in the near future that will not only be very profitable to the promoters, but the mine owners as well, as it will give us a home market for all base ores, that are comparatively valueless. Yesterday we had a sunshiny day, but to-day (Sunday), the 10th, it is raining again, with every prospect of an extended storm.

MINING IMPROVEMENTS.—*Grass Valley Union*, The Nevada Gold and Silver Mining Company are negotiating for heavy machinery to work their mine at Ophir Hill. The company have also bounded the Peabody mine, and the Grass Valley Mining Company's claim on New York Hill, better known as the old Bobby Smith ground. Work is to be commenced on all these claims immediately. At an early day the company will also erect a 10-stamp mill, with all the modern improvements, a mill site having already been secured near Boston ravine.

Sierra.

COLUMBO MINE.—*Mountain Messenger*, Feb. 9: An important discovery was made in the Columbo mine a few days since. While the men were at work in the ledge, they cut through about a foot of bed-rock alongside the ledge, and discovered another about 11 ft wide, the rock from which prospects better than that of the original ledge. No one outside those interested, knows what the rock paid per ton for the first run, further than that it was more than \$12. The sulphurets are saved by a true concentrator, and their assay value is \$800 per ton. Several tons have already accumulated. These sulphurets will be shipped below for reduction. During the late run of the mill it was discovered that there was some lead in the ore, which interfered somewhat with the process of amalgamation. We presume, however, that it is not likely to interfere much with the saving of gold, as the quantity is not great in any rock yet worked in this section.

MARGUERITE MINE.—*Mountain Messenger*: The Marguerite quartz mine seems to be in trouble again. A few days ago a lot of wood was attached by a creditor at the city. The company is in debt to Jim Miller about \$1,600 for beef, and owes Sol Rousseau some \$3,000 for freight, etc. It is also behind some 20 months with the workmen. The cause of this backwardness no one seems to know, as the principal owners, Robinson and Humbert, are reputed to be wealthy. It is said that the property is covered by a mortgage for \$100,000. The company are still making improvements. They have a large turbine wheel at Truckee, which is to be put in place some distance below the mill, and the power conveyed to the mill by means of a wire rope, to run the hoisting works. This wheel is to be run by the same water that is used to drive the mill. The fall obtained is about 30 ft. They are sinking the shaft preparatory to crosscutting to the rich chimney worked in the levels above. It is expected that a tunnel will be started south in the spring to cut ledges known to lie in that direction. Louis Garibaldi is reported to have obtained a good prospect in gravel at the head of Coyoteville Ravine. The Buttes mill, No. 9, is expected to be ready to start 20 stamps about the first of March. About 200 ft of tunnel has been run on the rich ledge owned by Sunderbause and others, on Packer creek.

THE RUBY MINE.—*Sierra Tribune*, Feb. 16: Forty-six men are employed at the Ruby mine at present. Four breasts are opened out. The course of the main tunnel has been changed and is now being run towards the east rim-rock. A new gangway was started from the main tunnel last week. The channel has recently taken a turn toward the northeast. Sixty and one-quarter ounces of gold were cleaned up week before last. The scarcity of water has prevented a great amount of washing being done since gravel was found the last time. At the same time, Superintendent Coleman is getting everything in shape to increase the working force and wash on an extensive scale as water commences to flow more freely.

BALD MT. EXTENSION.—*Mountain Messenger*, Feb. 16: Last Saturday the Bald Mountain Extension Drift Mining Co. paid its first dividend, of two cents per share. The stock of the company is divided into sixty thousand shares, three thousand shares being an original interest. The company was organized in 1874, and has been steadily at work since 1878. This dividend, though small, is encouraging, although made from the south fork ground. The main tunnel is making satisfactory progress in the lava above Ruby channel, something over 300 ft being completed. The Company has temporarily reduced its force, owing to the fact that its dumps are all full, and there being no water to wash. The large dump now contains about 3,000 carloads. About half a force is still at work.

RUBY.—The Ruby Company has been obliged to "lay off" most of its men, owing to the extreme cold.

BUNKER HILL DRIFT MINE.—No work has been done in the Bunker Hill mine since about Christmas, owing to the freezing of the water used to force air into the workings. When water was suspended the gravel was richer than any they had had for a long time. The snow at the mine is about 11 ft deep, which insures the company plenty of water next season should no more fall. The Buttes Company have No. 9 tunnel in over 3,600 ft, and have put their men at work on the second twenty stamps for No. 9 mill. The contractors running the Grand Prize Co.'s tunnel have made 70 ft. The contractor on the Sunnyside tunnel is making good progress, the rock being moderately soft.

THE BALD MOUNTAIN MINE.—At the above named mine, about sixty men are employed at present. A larger force will be worked whenever an increase of water comes. About 21,000 carloads of gravel are stored in the two dumps. In addition to taking out the pillars in the main tunnel and Lowell avenue, new ground is being opened near the air-shaft. The storms have not as yet made any perceptible increase in the water supply, and consequently but little washing is done. However, about 100 ounces of gold are cleaned up per week.

WORK PROGRESSING.—At the Rainbow mine, a stone's throw below Alleghany, the work of pushing ahead the new tunnel is going rapidly ahead. Two Burleigh drills are kept constantly at work and the tunnel has already been run 600 ft. One hundred and seventy-four ft were run last month. The length of tunnel required to tap the ledge is 2,000 ft. At the present rate of progress, the entire distance will be

run in seven or eight months. The mill will not start up until that time.

BRANDY CITY.—The quartz ledge located some time ago John J. Williams has been thoroughly tested by two mining experts. An Eastern Company have become interested in the property and will erect a ten-stamp mill next spring and develop the mine on an extensive scale. The Brandy City M. Co. have made a short run, but owing to the scarcity of water had to suspend operations. The machinery for running the drain tunnel, which was hauled in over the rough roads by way of Grass Flat and Eureka, is in splendid order, running by water power and doing good work.

Siskiyou.

SAWYER'S BAR.—*Yreka Union*, Feb. 6: The scarcity of water has compelled a majority of the mining claims to remain idle, only two or three at present working to any advantage. The Klamath mill is cleaning up to-day, and those concerned are confident of good results. They will have to wait for milder weather before they can start the mill again. The Uncle Sam has no water. The snow is four ft deep at their mill, which assures them a good supply of water the coming spring and summer.

Trinity.

THE OUTLOOK.—*Trinity Co. Journal*, Feb. 16: The freezing weather which of late has dried up the water and prevented storm seems to have broken, and indications now point to the proverbial "spell of weather" which shall shower blessings on all the people. From 14 deg. Thursday morning, the thermometer rose to 34 deg. Friday morning, and the vain attempts at storming of the past two days have settled into a snow-storm of much promise. Water will soon be plenty and the stamping of quartz mills and groaning of arastras will keep time with the merry music of the hydraulic and the sluice. At the present moment the prospects for this section are much brighter than at any time for several years, and the close of the present season promises to advance Trinity far toward the head of the column of the gold producing counties of California.

FROZE UP.—Reports from Deadwood district say the freezing weather has stopped all the arastras in that section with the single exception of the one owned and run by John E. Gibson. This arastra is run with one of Davidson's Turbine Wheels which does splendid work and refuses to be interfered with by cold weather or other obstacles. Mr. Gibson is building a second arastra to be run by the same wheel, which will furnish sufficient power for both.

MINING OPERATIONS are suspended throughout the county on account of the severe cold and freezing weather which has almost stopped the flow of water. There is nothing in this, however, to discourage the miners, as they well know the supply of snow locked up in the ravines and mountains is sufficient to last long into the summer and they can well afford to wait until warmer weather releases it and fills the ditches with water for mining purposes.

NEVADA.

Washoe District

GOULD AND CURRY.—*Virginia Enterprise*, Feb. 16: The winze joint with Best and Belcher below the 2500 has about reached the 5700 level. The decomposed material has been passed through, and the bottom is now in birdseye porphyry. The winze is exceedingly hot, owing in part to the constant dripping in of hot water from the soft ground above. Not much water comes in through the birdseye porphyry. At the Bonner shaft the 1200 station has been reconstructed and made one-third larger than it originally was. The shaft is found to be in good condition to within 25 ft of the 1500 level. They are now drifting north from the 1200 station.

SIERRA NEVADA.—The upraise from the main north drift on the 2900 level has been connected with the 2700 level. The raise is now in good shape from bottom to top and will prove of great value, as by means of it all the ground above the 2900 level may be thoroughly ventilated and prospected. The northeast drift on the 3100 level is being pushed ahead and is showing streaks of quartz with some ore. As these streaks run about the same course as the drift not much that is new is likely to be developed until a crosscut is made.

UNION CON.—The connection has been made between the main north and south drifts on the 3100 level. It will now take about a week to grade down the northern portion of the drift, put in car track, etc. This connection gives a circulation of air that will thoroughly ventilate all the north end mines. From the great air gallery—which furnishes 20,000 cubic ft of fresh air per minute—a new departure in exploration may be taken.

OPHIR.—A considerable amount of ore is still being taken out of the 150 level, and a good deal of prospecting is being done. On the level one drift is being run north, and two are being run west. By means of these the ground at that depth will be pretty thoroughly explored.

ALTA.—The east drift on the 2150 level is in a kind of quartz that breaks badly in blasting, as it blows out in pot holes. This quartz gives low assays. The west drift is in ground that works very well and shows stringers of quartz that carry some metal. It is now out 1,500 ft.

COMBINATION SHAFT.—The shaft is now down a little over 2,750 ft. It is going down in very favorable ground. At the 2800 level a station will be opened and a drift started west, but the shaft will not stop at that point; it will be pushed on down to the 3000 level. The two hydraulic pumps, and all the pumping apparatus and machinery, are working well and smoothly.

BEST AND BELCHER.—The joint Gould and Curry winze below the 2500 is now about down to the 2700 level. It has passed through the soft, decomposed material, and is now in birdseye porphyry.

HALE AND NORCROSS.—Are still sinking the winze below the 3800 level. It has already attained a depth that will give all the sump room that will ever be required, and the work of cutting out a station at the 2800 level will doubtless be commenced in a day or two.

IMPERIAL.—The drift from the 600 station is now probably in the old ground to the west. It is out about 600 ft and has passed through over 100 ft of quartz and quartz mixed with porphyry. Already it

is seen that in this section is a promising field for exploration in this mine, the Exchequer and Alpha.

UTAH.—The northeast drift on the 1750 level is making the usual rapid progress, and is now 270 ft. It is still in quartz of promising appearance, which still carries some metal.

SAVAGE.—The north drift on the 2600 level is being advanced as rapidly as possible. It is in vein material of a very promising appearance. When sufficient nothing has been obtained crosscuts will be run from this drift.

YELLOW JACKET.—Not much work can be done in this mine at present, as the ore cannot be reduced, owing to the freezing up of the mills on the Carson river. As soon as the mill wheels thaw out, all will again go on as usual.

BELCHER.—Owing to the freezing up of the mills on the Carson river, work at the mine has been discontinued, and the miners laid off. As soon as the mill wheels thaw out all will go on as usual.

CALIFORNIA.—Joint Consolidated Virginia winze No. 2 has reached the 2000 level, and a station is being cut out preparatory to drifting to connect with the main south lateral drift of the level.

CONSOLIDATED VIRGINIA.—Joint California winze No. 2 has reached the 2000 level, and a station is being excavated from which to drift out and connect with the main south lateral drift of the level.

Bernice District.

PROMISING.—Cor. *Silver State*, Feb. 12: The mines have never, in the history of the county, promised so much as at present. Of Bernice district, which is nearer your town than to our own by the most accessible route, your correspondent can speak only from hearsay. Parties in from there, however, report everything progressing finely. The mill—ten-stamp—has started up lately on ore from Goodell & Williams, and from Healey's and Hoyt's claims, with a prospect of running steadily for some months. It is conceded by all who have visited the camp, that it will make one of the most reliable little towns in the State. Wood and water are in abundance, and the leads are well-defined and of good grade. This camp alone will probably double our population in the next twelve months.

Bristol District.

DULL.—White Pine *News*, Feb. 9: At Bristol it is very dull, though the Day Co. are getting ready for a long and, I believe, successful run. Richard Walsh is their foreman. They are taking out large quantities of ore from the Day mine. The Mendham mine, owned by the same company, 20 miles from Bristol, is also turning out some rich ore.

Columbus District.

COLUMBUS CON.—*True Fissure*, Feb. 16: The drift from the bottom of the Bonanza winze has reached a length of about 128 ft. This drift is running to connect with the shaft on the third level, and there remains about 19 ft of a drift yet to be run before the above mentioned connection can be arrived at. The main shaft has attained a depth of about 105 ft below the station of the third level, making a total depth of about 355 ft. The work of cutting out the fourth level station is now under way.

GREAT EASTERN.—In running a crosscut to the west, 200 ft from the mouth of the tunnel, a body of ore from two to three ft in width was encountered. It has steadily improved in appearance since first struck and continues to look very promising. There are now some five or six tons of ore on the dump, and the arrangements are being rapidly completed for taking out the ore with better facilities. This property was formerly called the Schiller and was relocated by T. J. Harrington, W. H. Elliott and P. Manning, who are the present owners.

BAZAN.—Work is being prosecuted on this mine by W. H. Kent and E. Gifford, under a lease from the owners. Some very good ore is being extracted and the ore body is of a very fair size. A carload was shipped by rail on Sunday last, from which good results are anticipated. The Bazan and Sultan claims are adjoining and a joint shaft has been sunk on the line to enable the working of either as may be desired. Good ore has been obtained in both, either of which is a paying proposition for a small number of men working as partners.

LUCKY HILL.—T. J. Harrington, John Casey and J. Murphy have taken the contract for extending the south crosscut a distance of 50 ft. Fair progress is being made and with very satisfactory results, though the ground in the face of the crosscut is quite hard.

Cortez District.

CORTEZ MINE.—Reese River *Reveille*, Feb. 14: Very little is known or heard of the Cortez mining district, though we doubt if many mines yield more bullion than the Cortez mine, which is owned by one man. It is worked by means of a tunnel and 40 men are now employed. Since January 1st we learn that 20 bars of bullion, weighing 100 pounds each, have been shipped from this mine. Here is nearly two tons of silver produced in about six weeks by a mine whose name is hardly known to many of the public, though it is only a day's ride from Austin.

Paradise District.

THE PARADISE MINES.—*Silver State*, Feb. 12: A note from Supt. McCurdy, of the Paradise valley mine, says they have had a heavy storm in Spring City, but manage to keep running. The mines continue to look well, and there is a very encouraging improvement in the upraise from tunnel No. 4, or lower tunnel in the Paradise valley mine. They shipped, notwithstanding bad weather and the many drawbacks incident thereto, \$20,400 in January, and they expect to do as well or better this month.

Patterson District.

NOT OVER-ESTIMATED.—White Pine *News*, Feb. 9: I have been over to Patterson, the new mines discovered by Hamilton parties, and I can assure you their merits are not over-estimated. The rock in that section is very hard, but the ore is very rich and will pay from the surface down.

Pioche District.

ALMOST DESERTEO.—Cor. *White Pine News*, Feb. 9: I went on to Pioche. What a change in that once prosperous town! Empty houses, one-bit whiskey, nothing doing in her mines, and the once busy town almost deserted.

Reveille District.

THE WORK OF FOUR MINERS.—Cor. *Eureka Sentinel*, Feb. 16: It was not until October 18,

1872, that the Gila was located by Barnes and Clarke, who subsequently took Messrs. English and McGee into partnership with them. These gentlemen then purchased the old mill brought here by Lambert and Mason, putting it in thorough repair, which, during the first month's run, after having been changed to a dry-crushing mill, turned out a little over \$72,000. Now, this is seldom beaten by a ten stamper. Gov. Adams has not done the least thing toward starting leaching works. The cretion and successful running of the leaching works here were done by a few hard working miners, who leased the Gila dump and the old workings of the mine from Gov. Adams for one year. The names of these worthy four are Bianche, O'Malley, Ennor and Byron, and to them, and them alone, belong the honor and, I trust, the profit of erecting the first leaching works in this old camp. They deserve greater honor from the fact of putting this thing through in mid-winter. No frosts nor any other discouragements retarded their work. Soon the output of bullion will be steady and uniform, as the supply of raw material is practically and inexhaustible in this district. They will remove all the waste in the different drifts and stopes of the mine during the bad weather this winter, reserving the dump for next summer. Very soon they will have three tanks in full operation, which will insure them good profit from ten tons daily. In no other way could the fine dirt in and about this mine be treated successfully, as it would not pay to ship to the mill, distant ten miles, and treated with pan process, as the loss of quicksilver and freight would absorb it all. These men have just shipped by Mr. Norris, 24 sacks of gold No. 1, to be sold to a smelter in Salt Lake. This is the forerunner of much that will follow if the returns are satisfactory as compared with Eureka smelters, which only pay 67 per cent on high or low grade ores, while they actually get from \$30 to \$60 per ton for smelting all the ores from this district. Sixty-seven is probably all they can afford on Eureka ores, but not near enough on high grade ores.

Silver King District.

ORE.—White Pine *News*, Feb. 9: Fifteen miles south of Patterson, John Wheatley and two others are at work on what is known as the Hughes mines, Silver King district. They are down on two of their mines over 100 ft, and 50 to 60 ft on the others. They have developed a body of ore in one of these mines that assays from \$60 to \$100, and goes from 25 to 40 per cent in lead. Jack Wheatley claims it is the biggest body of ore in Lincoln county. Wood and water are adjacent in abundance.

Taylor District.

FULL CREW.—White Pine *News*, Feb. 9: This is quite a live camp as compared with Bristol and Pioche. The Argus Co. is working a full crew of men, and the Monitor people are prospecting with good results. They are down over 200 ft, and have good ore at that depth. The Argus mine never looked better than at present. But, notwithstanding our favorable mining prospects, business is very dull on the outside.

ARIZONA.

WEST SIDE.—Tombstone *Epitaph*, Feb. 12: During the week just passed connection has been made on the 400 level, this level now being open from shaft No. 1 to shaft No. 3, a distance of 1,000 ft. Stopping is now being done on this level for this entire distance. A large body of ore has been developed on the fifth level, part of which is in hitherto unworked ground. The ore body is at present developed for a distance of 85 ft, the development work still being in ore, and its extent is yet unknown. The company's mill and furnace at Charleston are running steadily, with good results. The furnace shipped 100 tons of bullion last month.

CONTENTION moves steadily on at its accustomed rate, producing its regular daily output of ore. The ore bins are kept well filled and the mill is constantly supplied with all the ore it can treat. The ore is of its usual good quality, and the bullion yield is satisfactory, indeed. The pumps are running steadily and smoothly, keeping the shaft dry at five strokes per minute. These pumps throw 80 gallons of water to the stroke, making 400 gallons to the minute, or 576,000 gallons in 24 hours.

GRAND CENTRAL is moving on its usual even tenor, and producing its daily output of 85 tons. The mill is doing excellent work and the product of bullion for the week was large. The pumps are at work steadily, and have nearly overcome the water, there now being only about six ft of water in the shaft. The stopes on the various levels are looking remarkably well, and it is estimated there is ore enough in sight in this mine to keep the mill running steadily for more than two years to come.

PROMPTER is still pushing developments on the 100 and 200 levels, and will make connection on the 200 level with the winze which was sunk in an ore body from the 100 level.

LUCK SURE.—During the past week prospecting in different places throughout the old workings has resulted in the discovery of what, with present developments, seems to be a body of high grade carbonate ore. This is in the bottom of the old workings; while 50 ft from the surface, and 50 ft north from the shaft, a large body of manganese ore has been uncovered, which shows indications of being connected with larger bodies to the north, and entirely distinct from any of the ore bodies found in the old workings. Several other places have been opened in which indications are good, and stringers of ore are found which promise to lead to other bodies similar to those which were worked out a few months ago. In this formation pockets and bodies of ore are liable to be found at any point, and it requires very careful work and thorough development of every portion of the ground.

LUCKY CUSS is still working three shafts, and producing a considerable quantity of manganese ore. During the past week some very high grade ore has been taken out.

EMPIRE is running along smoothly, hoisting a considerable quantity of ore, some of which is very high grade, and is put in sacks as it is taken down and piled up in the hoist when brought to the surface.

THE NEW BONANZA.—Tucson *Citizen*, Feb. 16: The Bonanza mines continue to attract attention from all parts of the country, and despite the repeated warnings of the press and the Superintendent of the mines, prospectors and laborers continue to

come by the tens and by the hundreds. Mr. Brook, who is about issuing a newspaper in Logan City, and came up from the mines this week, informed the writer that the principal street of Logan and New Virginia City is nearly a mile long, and that from appearances he is of the impression there are a thousand people on ground. The houses are of every known species of the inventive Yankee mind, supplemented by what has been learned from the Mexicans and Indians. There are a number of good frame houses about completed, and many others in course of construction. Then comes the canvas house, which is constructed of duck stretched over a frame of Oregon pine. A few have made preparations to build adobe houses; shanty houses, wickiups, tents and flies are to be seen in every direction, and anything that will protect the new comer from the storm and sun seems to be acceptable. There is no use of telling laboring men and miners to stay away from the Quijotoas; the tide has turned strong in that direction, and, as everybody knows, miners and prospectors, when once convinced that a new camp is about to build up will go and see for themselves, trusting to Providence for success, and if they fail they are ready to pick up their blankets and walk away. But the settlers of Logan and New Virginia City are not all laboring men and miners. Men with money are already on the ground. Grocery stores, hardware stores, provisions, clothing, liquor, news stands, in fact, every species of wares that can be thought of or used in a mining camp are to be found there in quantities. The road is lined with heavily-loaded freight teams conveying supplies of all kinds to the new El Dorado; from 10,000 to 15,000 ft of lumber arrives daily, which is bought up by the hungry builders as fast as it can be unloaded from the wagons. If this continues for any length of time the new city at the base of Mt. Ben Nevis will rival the older towns of the Territory in population. Work on the artesian well at Logan continues and is being pushed as fast as possible. The number of men at work on the mines has not been increased and cannot be to any great extent for some time to come. Prospecting in the adjacent hills and mountains is active and many good prospects have been found. This great rush to the Quijotoa mines is premature, but it will result in a thorough prospecting of all that region of country extending south into Mexico. The fever is raging and in spite of all that may be said and done to prevent it will run its course.

COLORADO.

EMPIRE NOTES.—Georgetown *Courier*, Feb. 16: The City of Empire lode, owned by W. H. Moore, has, (one half of it), been leased by Geo. W. Barrett and work commenced. Considerable ore is now being taken out. The Cashier, Coin, Mint, and a few other lodes have been leased and bonded to Wisdom & Co., of Chicago, who are diligently pushing work ahead. The old Bay State mill which was reported last week as running 12 stamps, has shut down permanently, on account of the leakage in the batteries, and more gold was lost than saved. Mr. Niemann says he is out \$1,000 in repairs, and now he finds that the sill underneath the batteries is rotten the whole length, and he don't propose to expend any more on old mills.

MILLED.—Twenty-one tons of 730 ore was milled from the 1st to the 9th, the average net value of which was \$380 per ton. This mine was a good producer in early days, when the ore was taken from near the surface, and now, at 300 ft, produces more than ever, and the grade of the ore is as good as that found near the surface. Much of the ore taken out during the past month milled from 700 to 800 ounces per ton, and during the month of January about 100 tons of ore was milled.

MILL RUNS.—The following are a few of the mill-runs that have been made during the past week: Six tons of Magnet ore milled 200 ounces silver per ton. A mill run of three tons of ore from Lebanon tunnel, returned 190 ounces per ton. Eight tons from the Boyd returned a 113 ounces per ton, and a high per cent in lead. Three and one-half tons of the Corry City ore milled 119 ounces per ton. Two lots of ore from the Equator averaged 100 ounces per ton. Four lots from the Stevens milled 145 ounces silver per ton, and 50 per cent lead. Two lots of Mammoth ore, nearly six tons, averaged 70 ounces per ton. Three tons of Pelican ore returned 154 ounces per ton. A mill-run of a lot of Vulcan ore returned 300 ounces silver per ton. The Stephens Concentrating Works, at Lawson, is running steadily, and plenty of ore in the mill. The Miners' Sampling Works will soon open up. Mr. Billings intends buying all kinds of ores in lots of any size. Work on the Mammoth lode on Sherman mountain, is being prosecuted by a force of lessees, who are extracting an average good quality of ore. In the lowest level of the Pay Rock, Proutt and party recently struck a streak of high-grade ore eight inches in width. This streak had heretofore been considered the wall, but when they broke into it, to their delight they found it to be entirely different from what they supposed it to be. The lessees on the Tishomingo, on Sherman mountain, near the Mendota, owned by Messrs. Old and Guanella, of Georgetown, have a streak of ore carrying gray copper and running high in lead. Although but little development has so far been done on the property, its prospects are said to be flattering. A lease on the Tishomingo, an extension of the Mendota, was let last Tuesday to a party of six who intend putting up a building and supplying machinery to sink the shaft. From four to fourteen inches of ore is shown up and down the shaft, which will run from 50 to 150 ounces in silver per ton, and from 50 to 60 per cent in lead.

IDAHO.

NEW PLACERS.—Walla Walla *Statesman*: It is reported that rich new placers have been struck 45 miles northeast of Pritchard creek, which would place the new digging in Montana at the base of the Cabinet mountains and 15 miles east of the Northern Pacific. The report, like a great many other rumors about the extent of the Coeur d'Alene, is very probably false. The summit of the Coeur d'Alene range, where Pritchard creek has its source, is the dividing line between Idaho and Montana. Eagle city, in the forks of Pritchard and Eagle creeks, is not more than 18 miles from the Montana line, and no prospects have been found on the Montana side up to date. Our readers will do well to take all these alleged reports of rich strikes in the camp with a pretty big piece of salt. It is impossible that prospecting can be carried on at this season. The altitude of the country forbids it. The snow is too deep and the

weather too severe, and the very nature of the country, broken as it is and densely timbered, gives the lie to these reports of rich new strikes in the dead of winter. On Pritchard creek big pay is realized in a few places, and enough has been taken out not only to prove that the gold is there, but to encourage capital to take hold and open the deeper portions of the creek. For it must be remembered that the creeks in their length are deep and comparatively flat, which will increase the cost and labor of extracting the gold. Whether gold exists on Eagle creek above the forks nobody knows, for nobody has prospected. With half a dozen exceptions the entire camp is located in 20 acre tracts on the suspicion that the ground contains gold. All that we positively know is that big pay has been taken out of a few claims on Pritchard creek, and that rich gravel has been found above the rim rock, from which it is safe to presume that there is also gold along the entire lengths of the creeks. It is also a likely country for quartz, and enough prospects have been discovered in quartz to justify us in classing the country as a mineral belt. It is about the likeliest country to prospect in that remains unexplored in the United States, but nothing has been discovered up to date to justify a stampede. Snow lays there until May 1st, and until snow goes the prospector can do nothing. Those who go in now are liable to see hard times unless they are well provided with ducats, for flour is \$65 per barrel and bacon 60 cents per pound. Freight from Rathdrum to Eagle city, a distance of 82 miles, is 25 cents per pound.

COEUR D'ALENE.—Private letter Ketchum *Key-stone*, Feb. 16: I am asked for my opinion of this country, but hardly know what to say as I have seen little by actual experience. I reached here to late in the fall to do much prospecting. I visited some of the best claims, and when they were cleaning bedrock saw plenty of gold in the unwashed dirt. But very few of the claims have been opened up and none of them have found bedrock; nothing but rim-rock. I think there is no doubt of some very rich ground here but it will cost stacks of money to get it out, because the country is flat, bedrock very deep, and the gold mostly on bedrock. The country is, however, a good deal like Wood river, for if one claim in a few pays it will be a very rich country. The gold belt seems to be extensive, but one great drawback is dense timber everywhere. As yet, there is very little known about quartz. It is not yet settled as to the probable best route here next spring. One company will try and navigate the Coeur d'Alene river, and another to bring in a trail from the nearest N. P. point, named Bellnap. Other trails projected, one called Jackass Prairie trail and Evolution trail. I think Trout creek trail will be the best. It is the hardest country to get to, for the distance, I ever saw. One is compelled to alternate between high mountains and swamps.

UTAH.

REVIEW.—Salt Lake *Tribune*, Feb. 16: The movement of bullion for the week is again light, the cold weather and storms materially interfering. The receipts of bullion in this city for the week ending February 13th, inclusive, were \$77,640.92; of ore, \$2,850; of both, \$80,490.90. The shipments from this city for the week ending February 9th, were 1,825.022 pounds. Of the total receipts of bullion, seventeen cars, valued at \$51,000, were from the Horn Silver, bringing the shipments of this company for the year up to \$243,000. The Ontario shipped for the week, 24 bars of Ontario, \$26,640.92, bringing its total up to \$180,597.98 for this year, to date. There is no report from the Hanaucr smelter for the week, and McCormick & Co. report but one receipt, that of one lot of Crescent ore, \$2,850.

ANOTHER VEIN.—The Salt Lake *Tribune* has been interviewing John Knapp, who has just got back from Coeur d'Alene. He first went to San Francisco and then up to Portland, and thence to Spokane Falls. Leaving Spokane Falls, Mr. Knapp journeyed along the Northern Pacific eastward until he reached Trout Creek station. Alighting from the cars there on January 23d, he started on the Trout creek trail for Eagle City, the only possible route at present available. Although it is only about 37 miles from Trout creek station to Eagle City, it took Mr. Knapp three days to make the journey, reaching Eagle City on the 26th. Horses were able to get in about 18 miles on this trail, but could not possibly make any further progress. The trail was lined with toboggans, from Trout creek to Eagle City, all bearing provisions and tools. These toboggans are simply long, rude sleds, and the burden some of them are forced to carry is simply marvelous. Frequently when climbing a steep ascent, the party pulling the sled will have to unload his toboggan and haul his merchandise up in sections. No wagons can possibly come along this trail, and parties coming in on horses are forced to leave them at a point at least twenty miles from Eagle City. The walking is the roughest imaginable—up and down peaks, over the backbone of the highest mountains, and the trail filled with rocks and boulders. Another road is now being constructed to Eagle City from a station called Belknap, on the Northern Pacific, east of Trout creek station. Twelve miles of this road were completed on Sunday last, and sixteen more are still to be constructed. This road will be wide enough for wagons to travel over, and will be ready for travel by March 1st. Mr. Knapp, after reaching Eagle City, remained there till February 1st, and made close observations of matters and things in general. Eagle City lies at the junction of Eagle and Pritchard creeks; and the main street of the town, which is sixty-five feet wide, is merely a continuation of the Trout creek trail. There are about twenty log houses with stake roofs on this street, and a few houses on the side streets. There are two restaurants—the Pioneer and the Nevada—and the bill of fare at the former, as copied by Mr. Knapp in his note-book, is as follows: Onions, beans, sowbely, rice, coffee, biscuit. For such a meal the modest sum of \$1 is charged, and three solid meals of that character a day cost \$3; by the week the board of course is cheaper, although the bill of fare never changes. A bunk is worth 50 cents, and the party using it is compelled to furnish his own blankets. Many men sleep on the snow; and on the trail from Trout creek station, men have established relay spots where camp fires are built at night, and the men throw their blankets on the snow, and sleep the sleep of the tired and weary.

Appeal of the Debris Case.

When it was stated last week that the defendants in the case of Woodruff vs. The North Bloomfield Mining Co. had "vacated" the appeal—that is, had withdrawn it—it was a matter of surprise to many, as it was the general impression that the case would be appealed. And this is the fact, and the proceeding referred to was only a matter of form; for a proper appeal will be made in due course of time, providing the mining community sees fit to furnish the necessary funds for the contest. And this very important point must be determined shortly, for without funds the appeal cannot be made. The shutting down of the hydraulic mines has stopped revenue from that source, and many of the miners who have been carrying on the legal fight can do so no longer. The lawyers for the miners have given an opinion on the subject of the proposed appeal to the Miners' Association, which is as follows:

If the defendants in the case of Woodruff vs. North Bloomfield et al., desire to appeal and stay execution for costs, it will be necessary to take an appeal and give a bond within sixty days from the 23d of January, 1884 (the day of entry of judgment). The judgment for costs will be about \$3,100.

As to the propriety of taking an appeal, we have to say that we think there are sufficient errors presented by the record to warrant a reversal of the judgment.

We think the court erred in overruling the demurrer for misjoinder of parties defendant. We also think it was error to give any judgment on the merits against the defendants. It was certainly erroneous to give judgment beyond the allegations of the complaint.

The complaint charges that the alleged evils are produced by hydraulic mining only; whereas the injunction prohibits all mining by the defendants; or even allowing their water supply to be used by others for mining purposes.

We also think that the court was mistaken in holding that restraining dams are impracticable.

If an appeal be taken to the Supreme Court of the United States, there will be a trial, *de novo*, on the evidence.

We advise an appeal, believing that the Supreme Court will reverse the judgment, or so modify it that mining may continue.

This opinion is being sent by the Miners' Association to quartz, drift and hydraulic mines in this State, with the following circular:

OFFICE MINERS' ASSOCIATION,
320 SANSOME ST., ROOM 23,
SAN FRANCISCO, Feb. 20, 1884.

DEAR SIR:—Enclosed please find copy of the opinion of our counsel, as to the propriety of appealing the Woodruff vs. North Bloomfield case to the Supreme Court of the United States.

After a careful perusal and consideration, we would like to have your views as to the policy of following the advice of our counsel.

The judgment of the Court is broad enough to include not only hydraulic mining, but all other classes of mining in the State.

To appeal the case, with the vast quantity of testimony and exhibits which involves its trial *de novo* in Washington, will cost considerable money, and the few who have up to this time contributed to the expenses of litigation, are unwilling, and some of them unable, to bear the further large expense of an appeal.

The order entered on the records of the Circuit Court, when the opinion was delivered, allowing an appeal, was premature, and entered by a mistake of the clerk, and has been vacated, on our motion, in order that a valid appeal may be taken, if finally so determined.

The effect of the vacation of the order granting an appeal, simply places the defendants in the same position they held on the entering of the decree, and does not prejudice their right of appeal within the limited time of two years.

Before taking further steps to appeal, we desire your views, as a member of this association, or as otherwise interested in the business of mining, or any interest dependent upon mining, as to whether you deem such appeal advisable; and if so, a further statement of what your company, or you individually, or your local community, will contribute to the expenses of an appeal in this case.

We further suggest that you submit this matter to your neighbors, that they may, as far as practicable, act in concert.

THE MINERS' ASSOCIATION,
By its Board of Council.
L. L. ROBINSON, President.
W. A. SKIDMORE, Secretary.

OLD FORTY-NINE TIMES.—Since Sawyer swears no mines shall be worked by the hydraulic process, about a dozen men are at work on the old '49 plan in the Milton Mining Company's ground at French Corral. They are scraping up the gravel from the bed-rock and wheeling it to their sluices where the washing is done. It is a very expensive way of working it, but yet it pays to work a small portion of the ground in that way. It will take only a few weeks to work it all out, however, and then they will be compelled to seek other places to labor. —*Nevada Transcript*.

Safety Lamps and their Management.

At a recent meeting of the North Staffordshire Institute of Mining and Mechanical Engineers, Mr. Charles Gordon read a paper on "Safety Lamps and their Management." He observed that the mining community was now anxiously expecting the report of the Royal Commission, which would no doubt greatly influence and direct the choice of the lamps of the future. It was highly probable that the ordinary Davy and the Clanny would receive their death-blow at the hands of the Commissioners; the former (which had been for many years in high favor and rendered good service) from its security in explosive mixtures, where there were strong currents, and the inducement to smoking which it presented, besides the ease with which a slight blow with a pick or a stone might instantly change it from a useful assistant to a highly dangerous weapon. The Clanny, which had always been a useful road lamp, was to be condemned from the element of danger arising from a sudden fracture of the glass without extinguishing the flame. The lamp of the immediate future that would probably be recommended by the Commissioners would be the Williamson, the Protector, or the Belgian Mueseler. The Protector and the Mueseler were formed on somewhat similar lines, whilst the Williamson might be described as a modification of the Stephenson and the Clanny. It had two glasses—the inner one resembling a Stephenson, and fitted with a copper top or cap. The outer glass resembled that of a Clanny. The method of supplying the Williamson lamp with air was similar to that of a Stephenson, but its great superiority over that lamp was due to the fact that the whole of the air must pass through a gauze to feed the flame. It was said that in all its trials this lamp had never been exploded. It further possessed the property of remaining alight when tilted, which lamps of the Mueseler pattern did not. The weights of lamps were as follows: Protector and Williamson, each 3 pounds 4 ounces; Clanny, 2 pounds 10 ounces; Stephenson and Mueseler, each 2 pounds 4 ounces; Davy, 2 pounds. The weight of the lamp should be studied, and especially of those carried by the firemen and officials appointed to examine the workings. It was only those who had to carry lamps all day, that could understand the fatigue it occasioned, and the lighter the lamps were produced, and the more convenient they were to handle, the better prospect was there of having the workings promptly examined. A lamp should not be made so sensitive as to go out at the least shock. In many cases lamps might be suddenly extinguished and leave the workman in total ignorance whether the cause was a shock or the presence of an explosive mixture. With regard to the attempts that had been made to produce an electric lamp for mining purposes, it was obvious to all acquainted with underground working that nothing but a self-contained lamp would meet the want. All lamps dependent on fixed wires must fail, since, from the ever-changing condition of mines, they were continually in danger of breakage, thereby causing the severance of the electric current. For permanent roads that stood well and for stations the electric light might be beneficially employed, but when that was the case it was generally safe to use oil lamps. The "Hope" safety lamp was a good pattern. This lamp, while evidently adapted from the railway carriage lamp, possessed other features, such as the gauze over the flame, the improved method of adjusting the wick, the fact that it might be fastened either with a padlock or lead rivet, and the avoidance of danger from fire. After noticing the various kinds of lamps now in use, and the districts in which they were most in favor, he quoted from a report of experiments made in October last in the Aldwarke Main colliery, showing that the Davy was exploded in each case, while for four hours attempts were made without effect to explode the Mueseler and Williamson lamps. Having made some remarks on the locking of lamps, he gave details respecting their illuminating power, and made suggestions as to the management of lamp houses. He next dwelt on the subject of testing lamps, and described a testing apparatus lent for the occasion by Messrs. Edwards, of Wakefield, who also lent a large collection of lamps, ancient and modern, for the illustration of the paper.

ITS FRUITS.—It is not generally believed by the miners that the intention of the valley people is to stop all mining. Such, however, is the intention, and it is just as well to look the danger squarely in the face. We know fair promises have been made as to the feeling in regard to drift and quartz mining, but promises are not of much account when belied by facts. In Sawyer's decree it is decreed that the defendant's and their officers or servants be perpetually enjoined and restrained from discharging or dumping into any of the branches of the Yuba river, any of the tailings or refuse matter whatever arising from mining. It also prohibits the enjoined companies from selling water to be used for any kind of gravel mining. The effect of this has been to take the water

from the Derboe, a drift mine, throwing out of employment a large number of men. It also puts an effectual damper upon the scheme of drifting the hydraulic mines, and disabuses, we hope, for all time, the minds of those persons who expected when the hydraulic mines were stopped to get cheap water to work small drift and bank diggings. The decree, in effect, shuts the water off at the head dam, not permitting him to use, or permit to be used, any of his water for mining purposes. The symptoms of another assault upon the mining industry are beginning to appear. This time it is the bar outside the heads at San Francisco that is being shoaled by the earth held in suspension. This is beyond the sand and gravel range, and we may expect now to hear all the changes rung upon this not exactly new grievance, and for which mining alone will be held responsible. We are not of those who think mining can be altogether stopped, but wish to put our people on their guard. —*Mountain Messenger*.

Electricity and Mining Appliances.

Mr. George G. Andres, in his "Continental Colliery Notes," describes several applications of electricity to the mechanical appliances of mining. The latest novelty in mining machinery is an electrical coal-cutter, or, to describe it more accurately, a coal-cutter of the ordinary type driven by electricity. It is obvious that electricity can be readily applied to this purpose, and it is strange that we have not heard of the application before. The advantages afforded by wires over pipes for the transmission of the motive agent are so clearly apparent that they need not be pointed out. The electric motor is of extremely simple construction, and designed for the circumstances under which it will have to work. Thus, one of the conditions of success has been fulfilled, and it is the one over which inventors usually stumble. In many cases, the inventor is not what is called a "practical" man, that is, one who is particularly acquainted with the work which the machine is designed to perform. As a consequence, it is defective in some details, and, failing in consequence to satisfy some one of the conditions of practice, it is condemned and thrown aside. Many a useful invention has been lost in this way that in competent hands might have been made a success. The electric coal-cutter, if reports are to be believed, will not fail on this account, for it is in the hands of men who know well what they have to deal with. It is said to be an American invention modified by a French mining engineer. Curiosity has been greatly excited respecting this machine, and the results of the trials about to be made are awaited with interest. It is easy to foresee, that however satisfactory the machine may perform its work, it cannot be used in a fiery atmosphere, on account of the inevitable sparking at the brushes, or other moving contacts. This fact will limit its application to non-fiery workings. Another obvious application of electrical power to mining purposes is to haul coal from dip workings. Portable hauling machinery of this nature could be constructed that would be perfectly reliable in action. This is a point to which attention might profitably be directed.

There have been some attempts made to employ electricity as the motive power for rock drills. These attempts have failed for the reason I have pointed out in the preceding paragraph. If electricity is to be successfully applied to this use, it must be by no means of a rotary motion. A permissive action may, of course, be derived from this; but it is a necessary condition of success that the motor revolve. Jalorinek's drill, which I have recently described, might be very effectively driven in this way. But whatever the construction of the motor may be, its moving parts at least must be protected against the water and the grit to which it will be exposed underground. It should not be difficult to enclose the whole of the motor within a metal casing, and such a shield would not only protect it against grit and water, but would render it capable of bearing the rough usage it cannot escape in the hands of miners. I give this advice to inventors gratis, and offer them the suggestions free of charge.

I have another word to say on the matter of electric safety lamps, on which I made some remarks a few weeks ago. All, so far as I observed, who discuss the question in this country, proceed on the assumption that the lamps are to be fed from wire leads as in the case of lighting at surface. I think practical men are pretty well agreed that the lighting of fiery workings cannot be carried out in this way. Irrespective of the trouble attending the use of wire leads in underground workings, the dangers of capture and "short circuits" rob the system of the advantage which the lamp itself gives it. But to combat this system is to fight the wind. No one, so far at least as my observation has extended, is thinking of lighting in this way. Those who are occupied in this work of lighting fiery places provide means for generating the current within the lamp itself by some form of galvanic cell of either a primary or a secondary nature. And it was to those efforts that my recent remarks were directed. The problem is beset with difficulties, but there is good ground for hoping that a sufficiently practical solution will shortly be arrived at. The chief difficulty has been the want of hearty co-operation on the part of mining men.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 253 Market St., S. F.

FOR WEEK ENDING FEBRUARY 12, 1884.

- 293,307. SPOKE EXTRACTOR—R. N. Caughell, Shedd, Ogn.
293,237. OIL CUP—R. A. Fisher, S. F.
293,443. STAMP CASE FILLER—A. M. & S. M. A. Forster, S. F.
293,323. TWO WHEELED VEHICLE—Geo. E. Guerne, Santa Rosa, Cal.
293,453. HOSE COUPLING—Sam'l. Hamer, Salt Lake City, U. T.
293,491. PUMP—N. Hemenway, Napa, Cal.
293,579. CAR COUPLING—Thos. C. Jones, Willows, Cal.
293,335. VACUUM PRESS PERCOLATOR—C. R. Knapp, S. F.
293,595. KIOSK—A. C. Y. Ribot, Los Angeles, Cal.
293,338. HARVESTER—Alex. Robinson, Benicia, Cal.
293,526. CHIMNEY CAP—M. Scholl, S. F.
293,549. RAILWAY RAIL CHAIR—Geo. Weeks, East Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HARVESTER.—Alexander Robinson, Benicia, assignor to Benicia Agricultural Works, No. 293,358. Dated Feb. 12, 1884. This improvement in headers consists in a spring hinge connection between the pole and main frame of the header, whereby the operation of raising the front of the header from the ground is rendered easy. In implements of this class, the pole or its crossbar is hinged to the main frame, and a long lever, which is attached to and fulcrumed upon said frame, is operated to raise or lower the front by turning the frame on its main wheels as fulcrum; but when the frame has been turned down at an inclination, it is difficult to raise it, because of its great weight and the thrust of the horses, and in order to assist the operation, ballast placed on the end of the lever is commonly employed as a counterbalance, and various springs have been attached to the lever and pole to accomplish the object. These, however, merely assist the operation of the lever, and are to a certain extent cumbersome and in the way, and are not of sufficient compass to allow the lever enough play, but will, as they are progressive in their strength, interfere with a free movement of the lever. By this invention of Mr. Robinson he accomplishes the result directly, by the connection or hinge between the beam and frame.

TWO WHEELED VEHICLES.—George E. Guerne, Santa Rosa, No. 293,323. Dated Feb. 12, 1884. This is one of the "breaking carts," as they are sometimes called; the two wheeled vehicles now so popular here. In this instance the improvements consist in novel supporting springs for the body, and in the means for regulating or adjusting the body to a level. The object of the invention is to render the vehicle a comfortable and easy riding conveyance, by obviating or preventing that unpleasant motion which the seat receives by reason of the joggling of the horse.

SPOKE EXTRACTOR.—Robt. N. Caughell, Shedd, Oregon, No. 293,307. Dated Feb. 12, 1884. This is a machine for removing spokes from a hub. The patent covers improvements on a previously patented device. Long jaws, with two clamping rings, afford great gripping surface, and the extractor can be fitted on the spoke without slipping, notwithstanding that the jaws are padded to prevent injury to varnish on highly finished spokes. Both in construction and operation the device is much improved.

SECRETARY CHANDLER, in answer to the Chamber of Commerce of San Francisco, asking an increase of the naval force, says: The Navy Department is in favor not only of building the engines, but of providing side-turrets and armaments for all four of the monitors, (the Monadnock, Puritan, Amphitrite and Terror), and making them formidable and effective armored vessels. If preference and priority of completion should be given to any one, it should be extended to the Monadnock, on account of its importance to the Pacific coast.

THE land act passed by the British Columbian Legislature gives pre-emptors the right to take up land west of the Cascades to the extent of 160 acres, and east of the Cascades 320 acres, at \$1 per acre. Speculators are limited to 640 acres, at \$2.50. Bunch grass or grazing lands \$1 per acre, coal lands \$2.50, with a royalty of five cents per ton upon coal lands acquired subsequent to the passage of the bill.

It is stated that if the South Yuba Ditch Company had been a defendant in the late debris suit and had been stopped from selling water, some 200 quartz mill stamps would have been "hung up."

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.
[ESTABLISHED, 1869.]

A. LUCKHARDT. B. SALAZAR.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials, MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG-
GISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17
California St., San Francisco.

We would call the attention of Assayers, Chemists,
Mining Companies, Milling Companies, Prospectors, etc.,
to our full stock of Balances, Furnaces, Muffles, Crucibles,
Scorifiers, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast, we feel
confident from our experience we can well suit the de-
mand for these goods, both as to quality and price. Our
New Illustrated Catalogue, with prices, will be sent on
application.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes,
will be sent free upon application. Agents for the Patent
Plumbago Crucible Co., London, England.

JOHN TAYLOR & CO.

G. KUSTEL. H. KUSTEL.
METALLURGICAL WORKS,
318 Pine St. (Basement),
Corner of Leidesdorff Street, - - SAN FRANCISCO.

Ores Sampled and Assayed, and Tests made by any
Process.
Assaying and Analysis of Ores, Minerals and Waters.
Mines Examined and Reported on.
Practical Instruction given in Treating Ores ap-
proved processes.

G. KUSTEL & CO.,
Mining Engineers and Metallurgists.

WM. D. JOHNSTON,
ASSAYER AND ANALYTICAL CHEMIST,
113 Leidesdorff Street,
Bet. California and Sacramento Sts., SAN FRANCISCO.
ASSAYING TAUGHT.

Personal attention insures Correct Returns.

The California
Perforating Screen Co.

All kinds of Quartz Screens,
slot or round holes; zinc, cop-
per and brass for flour and other
mills. BOOK & WAGNER,
123 and 125 Beale St., S. F.

San Francisco Pioneer Screen Works.

J. W. QUICK, MANUFACTURER.

Several first premiums received
for Quartz Mill Screens, and Per-
forated Sheet Metals of every
description. I would call special
attention to my SLOT CUT and
SLOT PUNCHED SCREENS,
which are attracting much at-
tention and giving universal satis-
faction. This is the only estab-
lishment on the Coast devoted
exclusively to the manufacture of
Screens. Mill owners using Battery Screens extensively can
contract for large supplies at favorable rates. Orders solicited
and promptly attended to.

32 Fremont Street, San Francisco.

Is the Best Pump in the World. Another
New Improvement is Lewis' Patent
Spray Attachment.

Can change from solid stream to spray instantly. Re-
tail price \$8. Weight, 4 1/2 lbs. Length, 32 inches.

FOR SALE BY JOHN H. WHEELER,
111 Leidesdorff St., S. F.

P. S.—A sample can be seen at this office.

INGERSOLL ROCK DRILLS

AND AIR COMPRESSORS.

The Latest Improved Ingersoll Rock Drill, with Large Ports, will do 20 Per Cent more
Work than the Old Ingersoll.

MINING MACHINERY.

For Catalogues, Estimates, etc., address

BERRY & PLACE MACHINE COMPANY, (PARKE & LACY,
Proprietors,
No. 8 California Street, San Francisco.

REPORT OF MR. WRIGHT, Agent, Boston Mine, Lake Superior, Michigan: Average drilling,
after two weeks' trial, with Improved Ingersoll Eclipse, National and Rand Rock Drills, in Jasper Rock, hard as
iron, 16" drilling per shift big work:

Ingersoll, D2 3", large ports.....	1.785 ft. per hour.
Ingersoll, E, 3 1/2", medium ports.....	1.601 " "
National, improved, 3 1/2".....	1.230 " "
Rand, improved, 3 1/2".....	1.041 " "
Ingersoll, D2 3", beat Rand 3 1/2".....	.744 " "
Ingersoll, D2 3", beat National 3 1/2".....	.505 " "
Ingersoll, E 3 1/2", beat Rand 3 1/2".....	.500 " "
Ingersoll, E 3 1/2", beat National 3 1/2".....	.321 " "
National beat Rand.....	.139 " "

[ESTABLISHED 1864.]

THE MOREY & SPERRY MINING MACHINERY COMPANY,

Successors to MOREY & SPERRY,

Manufacturers of all Kinds of —

Mine and Mill Machinery

WAREHOUSES:

92 & 94 Liberty St., New York.

WORKS:

Newburg, - New York.

The Foundry and Machine Shop has long been enlarged we are now prepared to
make from the most improved patterns QUARTZ and STAMP MILLS complete, for
working GOLD and SILVER ORES.

MOREY'S IMPROVED PULVERIZER.

Steel SHOES and DIES for Stamps, and Mine and Mill Supplies. Agents for IMLAY ORE CONCENTRATOR and the
MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given Send for Catalogue.

Address,

THE MOREY & SPERRY MINING MACHINERY CO.

MOREY'S IMPROVED PULVERIZER,

For WET or DRY Crushing.

SIMPLE, EFFICIENT and DURABLE

The Balls revolve horizontally without riction,
5 ft. size, weight 7,000 lbs., and does more work than 15
Stamps, 3 ft. size, weigh 3,000 lbs.

Concentrating Mills, Rock Breakers, Amalgamating
Pans and Separators, Roasting Furnaces, Hoisting and
Pumping Machinery, Engines and Boilers, any size
required, Hydraulic Giants and Pipe, Ore Cars, Ore
Buckets, Safety Cages, The Hand Power Two-stamp
Mill weight 350 lbs. THE EUREKA WIRE ROPE
TRAMWAYS, Concentrating Rifles for Mills and Hy-
draulic Sluices.

HYDRAULIC

MINERS:

THE ABOVE CUT REPRESENTS OUR NEW IMPROVED GIANT, WHICH
we recommend as being the Best Hydraulic Machine ever manufactured.
They are SIMPLER, LIGHTER, CHEAPER and MORE EASILY WORKED than any style
heretofore made. The machine is fully protected by patents owned by us, and we
will guarantee protection to our customers. Send for Circular and Price List.

HOSKIN BROS.,

MARYSVILLE,

CALIFORNIA

Mining Engineers.

GEORGE MADEIRA,

Geologist and Mining Engineer.

Reports on Mines furnished; Estimates of Machinery
etc. Special attention paid to the examination of mine
in Mexico, California, Arizona and New Mexico. Thirty
years in the mines of the above States.

SI HABLA ESPANOLA!

Address, care this office, or SANTA CRUZ, CAL.

WM. BREDEMEYER,
Mining, Consulting and Civil Engineer
50 E. South Second Street,
SALT LAKE CITY, UTAH.

UNITED STATES MINERAL SURVEYOR
for Utah and Idaho. Notary Public. Geological
Examinations, Reports on Mining Properties, Surveys
Mines, Railroads and Canals, and Superintends the
workings of the same. Prepares Estimates and Plans for
Opening and Working Mines, Expert on Mining Ques-
tions before the Courts. Address P. O. box 1157, Salt
Lake City, Utah.

KINGSLEY & KELLER,
MINING ENGINEERS,
Silverton, Colorado.

Attention given to the Construction and Erection of all
kinds of Mining Machinery, viz.: CONCENTRATORS, HOISTS,
WIRE-ROPE, and other TRAMWAYS, PUMPS, ETC. U. S.
Mineral Patents obtained. Underground Surveys and
thorough Reports made on all classes of mining properties.
Consultations can be had on a strictly business basis, and
for legitimate fees.

CHICAGO FRASER & CHALMERS. ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns.

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter also furnished J. P. Haggin or Olant and Old Abo Co., Black also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. Baby Bolts for Prospecting, 4 H. P. to 6 H. P.

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail. **HALLIDIE IMPROVED ORE TRAMWAYS.** We refer to Oon. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,760 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Captains, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$5 per half yearly volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street

News in Brief

It is stated that the Judson manufacturing company intend establishing a reading room and library at their works.

The pump of the Alta mine on the Comstock, running six strokes a minute, is raising 604,800 gallons of water in 24 hours.

The Bisbee murderers all intend taking an appeal to the Supreme Court of Arizona, but it is thought that that tribunal will be overruled by Judge Lynch.

The Mexican Secretary of the Treasury has imposed five per cent additional importation duties on all dutiable goods from May 15th. He is also taking steps for the regulation of stamp taxes.

The Boston and Savannah Steamship Company is seeking to limit its liability for damages on account of the loss of the *City of Columbus*. The petition asserts there was no negligence or incompetency on the part of the company.

A Private telegram from Washington, received at Seattle, states the canal bill now before Congress, giving a company the franchise to connect Lake Washington with Puget Sound and collect tolls thereon, will undoubtedly pass.

It is now proposed by the French government, in regard to American bacon, to provide for its inspection at ports of entry at the expense of the government—the expense to be covered by a charge of 25 centimes per box.

The British Government has tendered to the United States the use of the steamer *Alert* for the Greely relief expedition. She was built specially for use in the Arctic, and will be used as a supply ship and follow in the wake of the other vessels.

JUDGE LAWRENCE, Controller of the Treasury, and one of the largest wool-growers in the country, says that since the tariff act of May last, the price of domestic wool has decreased 15 per cent. Wool-growers hope for nothing from this Congress, but will keep demanding restoration of the tariff, and to secure this end will organize.

WILL PROSPECT.—We are reliably informed and pleased to note the fact, that the Sierra Buttes Company intends to change the policy which has heretofore prevailed in its management, of confining its attention exclusively to the Buttes ledges, and will, at no distant day, take hold of some of the numerous ledges in the vicinity of Sierra City, and develop them. The owners of the Buttes mine live in London, and have been largely interested in mines in India or some other far-away country. By these investments we learn they have lost something like forty millions of dollars, and have now resolved to turn their attention more directly to California quartz. The owners of the Plumas Eureka have already branched out a little in this direction. Some little time ago they bonded the Halstead mine, Plumas county, for sixty thousand dollars. Four men were put to work, and after a little over three hundred feet of tunnel had been run the lode was reached. Only a few feet had been run into the ledge which is estimated to be about twenty feet thick. The rock is not exceedingly rich, but is fair. With but a trifling outlay this company has demonstrated that the Halstead is worth looking after. At Sierra City there are a dozen ledges, any one of which might be developed at a comparatively slight expense by a company that has unlimited capital. The Buttes company can prospect far cheaper than any other, for the reason that it has all the management needed for any number of mines; its agents are on the ground and can give to the work their personal attention; it can get its supplies cheaper, and has at its disposal men trained in the business of quartz mining. We hope the report is true, and the early spring may see this work of development begun.—*Mountain Messenger*.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

"The Baldwin" Hotel

Ranks high up in public favor and is regarded as second to none in the country. It contains 600 rooms and is elegant and first class in every appointment. Mr. H. H. Pearson, the proprietor, with large and popular experience has the rare faculty of anticipating the wants of his guests. Traveling men in speaking of the Baldwin always do so feeling a sense of gratitude, for it always suggests pleasant associations and good living. It is located on Market street, corner Powell, in the heart of San Francisco. Among its guests are noticed the names of the leading and substantial men of this country.

IMPORTANT additions are being continually made in Woodward's Gardens. The grove, walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing only one cent) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some responsible party requested to stop it, we shall positively demand payment for the time it is sent.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

ASSESSMENT NOTICE.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador county, near Drytown, California.

NOTICE is hereby given, that at a meeting of the Directors, held on the 30th day of January, 1884, an assessment (No. 44) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1884, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 10th day of April, 1884, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHBY, Secretary.

OFFICE—No. 402 Front Street, Room 8, San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

San Francisco, February 2, 1884.

At a meeting of the Board of Directors of the above named company held this day, Dividend No. 64, of twenty-five cents (25c) per share, was declared, payable on TUESDAY, February 12, 1884, at the office in this city, or at the Farmers' Loan and Trust Company, in New York.

WILLIAM WILLIS, Secretary.

OFFICE—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, Cal.

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. At a depth of 500 feet. The Whim is made of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of this whim is bolted to bed-timbers

TATUM & BOWEN,

and

187 Front Street, PORTLAND, OREGON.

SOLE AGENTS FOR

The Albany Lubricating COMPOUND AND CUPS, THE ALBANY SPINDLE OIL, THE ALBANY CYLINDER OIL, THE ALBANY VALVOIL, The Sight Drop Cylinder Lubricator.

WE ALSO IMPORT LARD OIL, WEST VIRGINIA LUBRICATING OIL, DOWNER'S MINERAL SPERM SKID OIL, ETC.

These Lubricants have been for the last eight years, and are now, in general use in nearly all the mills, mines and steamers on this Coast, and the fact that the demand constantly increases is sufficient evidence of their superiority.

GIANT POWDER

MANUFACTURED UNDER ALFRED NOBLE'S Original and only valid Patents for NITRO GLYCERINE Powders, which has been and still is of such immense advantages to the Miner, Railroad Man and the Engineer. All other Nitro-Glycerine Compounds are simply imitations and adulterations of the Original Giant Powder. The Giant Powder Company manufacture three grades of Powder, which are the Safest and Strongest High Explosives in the market. The Original Nitro Glycerine Compound, GIANT POWDER or DYNAMITE, is acknowledged by all the great chemists of the world as unapproached by any other compound. The Giant Powder Company have acquired the exclusive right to manufacture "NOBLE'S EXPLOSIVE GELATINE," which contains 96 per cent. of Nitro-glycerine. It is still stronger than Dynamite, and even safer in handling. This explosive was used in constructing the Mont Cenis Tunnel. THE JUDSON POWDER is a black Powder owned and manufactured by the Giant Powder Company; is from three to five times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it Breaks More Ground, Pulverizes Better, and Saves Time and Money. The only difficulty heretofore experienced by some consumers of this Powder has been that it required more time to get it to the bottom of a deep borehole. This has now been entirely overcome, and our JUDSON IMPROVED is now as dry as the ordinary Blasting Powder and runs as freely.

Triple, Quadruple and Quintuple Caps and all grades of Fuso for Sale.

HEINE PATENT SAFETY BOILER.
RISDON IRON AND LOCOMOTIVE WORKS,

Sole Agents for the Pacific Coast,

Corner Beale and Howard Sts., San Francisco.

Economy in space and fuel. Safety at high
pressures. Freedom from scaling. Equally
adapted for power and heating purposes.
Especially adapted for mills, factories, hotels,
stores or any place where safety is a necessity.
Will work well with muddy water and any kind
of fuel.

TESTIMONIALS.

St. Louis, Mo., Sept. 23, 1883

Messrs. Adolphus Meyer & Co.—GENTLEMEN.
We cheerfully certify that the "Heine Patent
Safety Boiler" put up by you in our establish-
ment has proved very satisfactory in its working.
The chief points of excellence in the "Heine
Safety Boiler" are its economy in fuel and space,
freedom from scaling, aptitude for power and
heating purposes, working equally well with clear
and muddy water. We warmly recommend it to
all using steam machinery. Yours truly,
ANHEUSER-BUSCH BREWING ASS'N.

OFFICE OF Supt. of ROYAL RAILWAYS,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer. In reply to
your inquiry of September 2d, we respectfully in-
form you that the three boilers built under your
patents, under steam since September 25, 1881, at the Alex-
ander Platz Depot, as well as the two at Friedrich Strasse
Depot, under steam since September 22, 1882, have given
good satisfaction, requiring no repairs whatsoever to date.
The internal cleaning of the boiler was always accomplished

with ease on account of the convenient arrangement of the
tube caps, the adhesion of scales being fully prevented
thereby, and the boilers kept in prime condition.

(Signed) BRAUCKE.

The PACIFIC WATER JACKET SMELTERS embrace
many features that are entirely new and of great practical
utility, which are covered by letters patent.
No other furnaces can compare with these for dura-
bility and in capacity for uninterrupted work.

MORE THAN ONE HUNDRED of them are now runs
ning on the Pacific Coast, giving results never before
obtained as regards continuous running, economy of
fuel, grade and quality of bullion produced. We are
prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requir-
ing no brick or stone work, except that for the crucible,
thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity
and with all the improvements that experience has sug-
gested as valuable in this class of machinery. Skilled and
experienced smelters furnished when desired to a upon
intend construction and running of furnaces. Estimates
given upon application. Send for circular.

**\$1,000 CHALLENGE!****PRICE REDUCED,**

Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS (\$575.00).

THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

OVER 800 ARE NOW IN USE. Saves from 40 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the office of Hunkley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that all shaking motion applied to an endless traveling belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of \$1,000.

We know of none in the market that will bear comparison with the Pumps manufactured by HENRY R. WORTHINGTON. We invariably use them.
 Chris Bros. & Co.,
 Hydraulic Elevators.

George H. Bailey, of lawful age, being duly sworn, says: "I reside in the city of Newark, New Jersey, and am by profession a Hydraulic Engineer; that has been my exclusive business and subject of study since 1846. A water card is depended upon by engineers as the most accurate indication possible of the performance of a pumping engine. I tested, with a corps of experts, a large Worthington Pumping Engine, running 48 hours continuously, and I have never known or heard of an approach to such a perfect result under the water card test on the part of any other Pumping Engine as is shown to have been yielded by the Worthington. In my judgement it demonstrates of itself the great practical superiority of that engine to any other pumping engine known. The duty performance of first-class pumping engines is a matter to which I have given close attention. I have superintended and been concerned in several of the most important comparative trials made in this country and am familiar with the results obtained at recorded public trials. I have repeatedly made careful trials of the Worthington Pumping Engine. The duty obtained I believe to be higher than any recorded duty of any other kind of pumping engine in the country tried by the accepted rules for duty trials. In regard to freedom from liability to accidents, I consider the Worthington Pumping Engine worthy of the highest estimation. I regard the pumping engine of Mr. Worthington as completely meeting all the requirements of heavy pumping work, economy, durability and safety; no other engine, in my opinion, ever did before." I have known heavy Worthington Pumps to run for 36 hours continuously within 1/2 to 3/16 of an inch of the cylinder heads.

For Practical Workers. \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientific, or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a

condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Refining; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value

of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 196 12mo. pages, with illustrations, well bound in cloth; 1881. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

N. B. This is Part I of three volumes on assaying by the same author. To be followed by Part II. Gold and Silver; Part III. Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of Mining and Scientific Press, San Francisco, at favorable rates.

THE HARMON SEMINARY, Berkeley, Cal.

A BOARDING AND DAY SCHOOL FOR YOUNG LADIES.

This institution will be continued with the spirit and methods of its founders by those who have grown up with them in their educational work. The corps of instructors is full and of recognized excellence in all departments.
 Address, THE MISSES HARMON, Berkeley, Cal.,
 or E. J. WICKSON, 44 Clay St., S. F.

Business Offices and Sunny Rooms to Let

We have some desirable rooms to let adjoining the offices of this paper, which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them.

VOLUME XLVIII
Number 9.

Foundry Notes.

Business at the foundries is generally slack, just now, many of the shops having very little in hand. Until the snow and floods are no more work is kept back, as shipments of machinery to the mountains is now well nigh impossible.

At the Globe Iron Works they have four or five of the Dyer Cannon-ball quartz mills on the list, but will not ship for some time yet. Last season they made quite a number of these mills, among others for the following: S. B. Drury, Iowa City, Placer County, Cal.; Eagle King, G. and S. M. and W. Co., Grizzly Flat, El Dorado County; E. R. Morey, Grizzly Flat, El Dorado County; Thos. Green, French Gulch, Shasta County; J. S. Stillman, Gold Hill, Nevada; B. I. Turman, Gold Hill, Nevada; Thos. Daily, Supt. Bonanza Mine, Grizzly Flat, Cal.; Green & Hauser, Assayers, San Francisco; D. Hagarty, Mineral Park, Idaho; C. J. Rempton, Redding, Shasta County; Chas. Gaily, Fine Gold Gulch, Fresno County; J. Zuckerman, Albany, Oregon; St. Auburn & Co., Redding, Shasta County; Thomas Osborn, Visalia, Fresno County; Wm. Hall, Redding, Shasta County; Galena M. Co., Emigrant Gap; Augustine Schronie, Grizzly Flat, El Dorado County; C. H. Hankins, Grass Valley; Daniel O'Neal, Buckeye, Shasta County; John Richards, Grizzly Flat, El Dorado County; Willard & Weil, Redding, Shasta County; Niagara Mine, French Gulch, Shasta County (Wm. T. Coleman, San Francisco.)

At the Risdon Iron Works, in this city, they have lately imported special machinery for making the Macbeth patent steel pulley, having obtained the right to manufacture for the Pacific coast. These pulleys are less than half the weight of cast iron pulleys. They are polished on the face, are made either crowned or straight, and are turned up on the boss part the same as the best make of cast-iron pulleys. On account of the improved mode of riveting, deep countersinks and large rivet heads may be formed in a thin rim. By this means great lightness is obtained with increased strength. An engraving of this pulley is shown on this page. These pulleys are coming into general use in Great Britain in cotton mills and such manufacturing establishments. Their chief recommendation is their lightness and strength. They possess an additional advantage over most pulleys in that they are turned true in a lathe the same as a cast-iron one.

A Flue Covering.

In Mr. Aaron's book on "Leaching Gold and Silver Ores" he describes a very convenient covering for horizontal flues which can be removed and replaced easily. It is shown in the accompanying diagram. It consists of a kind of arched tile made by binding together with an iron clamp as many bricks as may be required by the width of the flue, each tile or section having the length of one brick. The flue is covered with these sections, and the interstices are filled with mortar or a mixture of clay or sand.

GREAT effort is being made to increase the excitement about the Coeur d'Alene mines. Before yielding to the craze and starting for that region men will do well to remember the Stickeen and Frazer river excitements. The Coeur d'Alene country is very barren, cold, and difficult of access.

Water Rights and Mining Claims.

About a year ago a Montana miner who had applied for a patent on a placer claim had his claim rejected by the U. S. Land Office, and appealed it to the Secretary of the Interior. The case showed that after location of the claim in 1871 improvements were made to the value of over \$5,000, consisting of two dams, a tail-race, a supply ditch and a cabin (the latter valued at \$25 only.) The land is (or was) almost wholly

THE MACBETH STEEL PULLEY.

covered by a reservoir of water, leaving but a small portion of exposed land. The original application did not show the discovery of any mineral on the claim: and, although subsequent affidavits showed there is a deposit of gold in the gravel, and, notwithstanding the principal dam was "washed away" in 1876, thus affording opportunity for mining operations since that date, there was no proof that any mineral

Chlorination of Ore.

In the chlorination process, after the ore has been properly roasted, it is moistened before being put in the chlorinating vat. After being properly moistened it is sifted to get out lumps and impurities, and also because the more chlorine gas that can be introduced into the ore box or vat the snorer will the chlorination of the gold be affected. It is therefore important to sift the ore directly into the vat in order to

COVERING FOR HORIZONTAL FLUES.

have it therein in as loose a condition as possible. The vats are provided with false bottoms, to prevent leaching and to allow the gas to expand below the whole mass of ore and to ascend uniformly.

The engraving represents a tub filled with ore on a gravel bottom. Over the filter bottom, which is perforated with inch holes, is spread first a layer of clean quartz one and a half to

VAT FOR CHLORINATION OF ORE.

has ever been extracted from the land, or that work has been expended for that purpose. The Secretary of the Interior affirms the original decision in the case, and concurs with the Commissioner of the General Land Office in the opinion that the patent is not in fact sought for a placer claim, but for a water right, and that as such right cannot be patented under a mining claim, the application should be rejected.

A COMPANY has asked Congress for permission to be incorporated as a company under the name of the "Spokane Falls and Coeur d'Alene Railroad Company." The line of the proposed road is from Spokane Falls, Washington Territory, easterly via Coeur d'Alene lake and the Spokane and Coeur d'Alene valleys, with branch lines to several mining districts, the length of which would be about 75 miles. The Coeur d'Alene, Spokane, St. Joseph and St. Mary's rivers and Coeur d'Alene lake contain navigable waters, which could be used in connection with a railroad.

OWING to deep snows and great storms, mining news is somewhat scarce.

more perfectly than the pitch. In either case, however, after a long use, when the vat should be discarded, the staves should be burned and the ashes assayed for gold.

The moistened ore is then sifted into the vat, within about six inches of the rim, as seen in the drawing, leveled carefully, without pressing. The wooden cover, *a*, is laid upon the rim, after a piece of cloth, *b*, has been tacked to the side of the vat near the water pipe, *i*, to prevent the jet of water disturbing the surface of the ore. The pipes, *i* and *l*, before the hose is used, must be closed with stoppers, also the hose, *c*. It is better, in place of the pipe, *i*, to have only a hole into which the hose is inserted when the water is needed. The chlorine gas can be admitted now into the impregnating vat.

Precipitation of Gold.

Comparing the processes of precipitation of gold, the first by the ferrous sulphate in an acid solution of the tetrachloride of gold, is in its manipulations simple, and, in case the solution of the tetrachloride of gold is free from chlorine, bromine, hypochlorites of lime, magnesia, soda and free nitric acid, etc., is complete. But this need not be the case in the chlorination leach-brines; they may contain not only chlorine in an absorbed state, but also a series of tetrachloride and hypochlorites of alkalis and alkaline earths, which may cause an incomplete precipitation; while on the other side the leaches of pure gold quartz not containing magnesia or lime will be precipitated entirely by the ferrous sulphate. The protochloride of iron will do it as well, but it is more costly and very liable to decompose, and cannot be transported in packs or wooden cases, but in jars of porcelain or glass; nor can it be utilized as a by-product of mining process, but must be manufactured by dissolution of pure iron in muriatic acid.

The second process, by the sulphuretted hydrogen, is in its execution more complicated, an apparatus to develop the sulphuretted hydrogen being necessary, and a temperature of 50 to 60° C. But this process can be brought in use in all cases where the gold containing liquids are not pure and do not contain copper even in small quantities. The advantages of this process is that in a warmer solution the precipitation is rapid, and that after reducing all oxydizing compounds in an excess of the sulphuretted hydrogen the precipitate settles quickly, and may be separated from the liquid at once and completely without loss of time or gold.

Referring to a late correspondence in the PRESS between Mr. Aaron and Mr. Bowles it is difficult to understand what advantage would arise in case the sulphide of copper would decompose the chloride of gold, separating pure gold, and washing the mixture of copper sulphide and gold with a new gold solution. From a practical point, certainly none; as it is not ascertained whether this decomposition goes on quickly or complete; while on the other side the sulphide of gold, by a simple refining process, may be separated and purified. The suggestion indicated by Mr. Aaron in his last letter, to let only an imperfect saturation of sulphuretted take place, depending on the supposition that some sulphide of copper which has been formed by sulphuretted hydrogen would reduce the tetrachloride of gold, is hazardous, and the best plan will always be to precipitate the gold in the form of a sulphide by a perfect saturation and a considerable excess of sulphuretted hydrogen.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents. —Eos.

Bodie.

[From our Traveling Correspondent.]

The Bodie Tunnel

Mill and Mining Company is under the superintendence of Thos. Buckley. The 15-stamp mill started up a few weeks since. The Bodie tunnel mine and mill now employs about 30 men. Pulp assays average \$18.50. They have a well defined ledge, about 2 to 2½ feet thick. They opened on the 200 and 300 level another ledge adjoining and east of this, and on that have openings on 200, 300 and 400 levels, and on all these levels have good pay ore. The tunnel has cut in all 21 veins, large and small, that are located and claimed, but some have not yet been prospected further than being cut by the tunnel. One year's supply of ore is now claimed to be in sight, ready to be stoped out. The bullion carries so much gold as to rate at \$8 to \$10 per ounce. The mill and mine seems admirably located, and the mill very conveniently planned. After leaving the agitators, the tailings pass out of mill and through blanket sluices placed under a covered long shed.

I should have mentioned above that considerable of the ore furnished this mill and passing through same tunnel, is from the Bechtel mine, a part of the same group and under the same management.

East of the Bechtel is the Tioga, with the Syndicate to the north and the Standard Consolidated to the south. The Tioga has a shaft about 900 feet deep, with crosscuts exposing large, strong veins, with some pay. The Standard and the Syndicate veins running through Tioga at that point are not so rich as in their own ground. But the Tioga may in further explorations open up a similar rich chimney of ore. To the east of the Champion and Goodshaw is the Dudley, which has been explored extensively, but before the Leut shaft of the Bodie was started they were flooded out, and have not since renewed work. Found rich ore pockets in their tunnels.

The Syndicate mine is in better shape for paying business than it has been in five years. It is now paying dividends, and looks favorable for continuance of same for time to come.

There is a very convenient and economical arrangement. The tunnel and covered trackway runs the ore car direct to the mill without any exposure to the weather or labor of rehauling the ore or hauling expenses. All their ore bodies yet worked are above the tunnel level, and are growing richer and more plentiful, as the bullion production shows.

The Standard Con.

The adjoining mine to the north (and under the same management) had at the same melting a single bar worth \$16,935.40, worth \$7.34 per oz.; the gold being of \$14,927.95 value, and silver \$2,007.46 and a small bar of low-grade bullion \$99.92, scraped from the copper plates. This gives an aggregate of \$27,689.87, which is not a bad output for one week from 30 stamps in the depth of winter, when the snow was deep and cold intense, the altitude of this place being a little greater than the top of Mount Davidson at Virginia City, or somewhere near 10,000 feet above sea level. This Standard Con. mine is spoken of by some very good experienced judges as one of the most promising mines of this whole belt. It measures 1500 feet by 1200 feet wide with patent title, has excellent machinery including air compressor and a steam saw cutting off and tenoning. Their mining timber, which is a marvel to all who see it operate, can do the work of many men and cut everything with great exactness. This mine has a tunnel connecting with the Bulwer Standard mill, and delivers ore direct in the mill at small cost; and a Hallidie, San Francisco, elevated wire tramway to carry the ore to the Standard mill, which reduces the cost of transportation to a few cents per ton, and is not interfered with by all great snow storms. It works automatically and very perfect, as it has been doing for the past five years, delivering during the daytime 63 to 75 tons to the mill. I was favored by the Superintendent, Mr. William A. Irwin, with the privilege of an inside inspection of this great mine, which some choose to call the backbone of this district. Others say "when you see this you see a mine," etc.—were the style of remarks made by disinterested parties.

The Bulwer Company is half owner in the Bulwer Standard mill of 40 stamps. At present the Bulwer has leased its half to the Standard. The Bodie Tunnel Company is now running out better grade ore than formerly to their 20-stamp mill, and making good results except some slight scarcity of water by temporary stopping of the pump at the Leut Shaft—the source of their water supply. They are running about \$20 ore—principally gold.

The Mono mine, lying south and adjoining the Bodie—heing the southern 750 feet of the original location of Bodie, which was segregated from Bodie.

The Present Bonanza Ledge

In the Bodie, was discovered first in the Mono three or four years ago; but at the point of cross cutting the ledge, they found it about six feet thick with the same kind of silver ore as is now found in the Bonanza, and some choice ores assaying thousands of dollars. They were obliged to relinquish work because they had

not machinery capable of lifting all the water of the hill, as the Bodie-Leut shaft, in conjunction with Mono, had not yet been started. Since then the Bonanza, having been found in the same vein, accidentally as it were, in the upper workings, gives a new impetus to start up the Old Mono, prospecting on the same lead now proving so fabulously rich.

The next claim adjoining the Mono on the south is the Champion, which has already a large amount of good development work, reaching a depth of about 500 feet. In drifting and crosscutting, some strong veins were cut, but holding so much water their machinery proved, as did Mono's, incapable to handle the water, but the machinery now will be ample, considering so many other works are draining the belt. Very recently the Champion Co. has elected as Superintendent Charles White, former foreman and discoverer of the bonanza in the Bodie mine, evidently with a high hope that he may be able to strike the continuation of the same belt of veins carrying these rich ore bodies. His starting up in the midst of snow storms, unusually severe, in an energetic manner, gives the community a large expectation that he will succeed in the desired expectations. He has already readjusted the machinery, and has a force of men below, repairing the underground securities. He seems very popular with the business men and miners.

The Goodshaw

Is the next south adjoining ground; Capt. Buckley is Superintendent of this mine as well as of the Bodie Tunnel mine and mill. This mine has works like the Champion, with hoist and pumps, and will no doubt, as early as convenient, start up operations again. Considering the record this property had years ago, in finding rich gold veins, which caused the mine to fluctuate on the stock market from \$1 to \$6, the prospect for rich ore is excellent, during the efficient management of this same superintendent.

The Addenda Mine.

Also the Oro, next on the south, each have good hoisting machinery, and are explored to the depth of 600 feet and 700 feet. These claims occupy the same belt which is here again more elevated, and assumed the title of Silver Mill. The veins in those mines are very similar to each other, carrying principally silver ores as rich silver and sulphides of silver, and the Oro mine has now about 500 tons of milling ore on dump, assay value of \$40 to \$50 per ton, being second-class ore, the first-class averaging over \$500, having been shipped and worked in San Francisco.

The Addenda has also considerable ore out, averaging about the same as that on the Oro dump.

Next south is the Concordia, with ore very similar with the last mentioned mines, the exploration having been done from the Red Cloud shaft, and it is reported they have found very good ore, but yet unexplored on account of the stoppage of Red Cloud's works by the pending litigation on the Red Cloud and Noonday mines. (This Noonday and Red Cloud group consists of different locations). In connection with these mines is the Noonday mill, which has been run some years from ores of the Noonday mine, taking out many hundreds of thousands of dollars in bullion. Haggin and Tevis, of San Francisco, are heavy owners in this property. Mr. Davis, of S. P. C. R. R., figures in the same now.

Other Mines.

Next adjoining, south, are the Maryland Con. and University, parallel location works, on Queen Bee Hill, with shafts down 500 to 600 feet, encountering some good ore. The Maryland Con. is now owned by a German company, with their representatives here to start up mining at an early date.

On the south of Maryland and partly parallel, is the El Dorado, which is at the south slope of Silver Hill.

They have a shaft down 150 feet with several drifts amounting to 100 feet to reach the ledge wall, the ledge being about 20 feet thick. There were several tons of rich ore taken out from this shaft. They are still exploring and taking out some good high-grade ore.

Beyond this is the Victor (with hoisting works) and other locations, but none of them at present are in operation. The Belvidere mine is now being worked under a six months' lease by Warren R. Lose, who is working six men stoping out ore, but for the present leaving it in the mine till ready to work it.

In the Mine.

We went down to the 400 foot level where the main vein lies, 180 feet east of main shaft; from this point we followed the vein 600 feet to the north of the main east crosscut. This crosscut is near the center of the claim. The vein as we followed it is considered 25 feet thick, all pay ore (except a few small horses) is milled. The main east crosscut up to the surface is worked out, but on the south there is a large amount not yet stoped out from the upper levels, and from this 400 foot level to the 500 foot not yet stoped out except about 200 feet, where the vein still holds out in size and about the same in grade.

On the 500 foot level are very extensive drifts on the veins, affording very extensive stoppings ready for the taking out of vast millions of tons, or seeming possibilities for that, in the pursuance of this giant vein, as the two winzes from the 500, at different points down 80 feet, show no depreciation of quality.

To go through all the workings of this mine,

on the different levels, would require, I am told, 24 hours steady moving.

Their main shaft is down to 1200-foot level which is now not being run as they do not care to handle the water at that depth now, as they have ample scope for years working above that. On the 700-foot level they are now making uprisings to connect with the 80-foot winzes of the 500 level for ventilation and exploration. These are each in ore of uniform paying character. On the 1000-foot level they are drifting north and south on the ledge, but have not crossed it to know its size. This appears to be a mine, and for this the bullion product has testified, as published a few weeks since in the Press.

The Late Dr. Eng Imann.

Death of a Celebrated Botanist.

At the last meeting of the California Academy of Sciences, Rev. E. L. Greene read the following:

The venerable and celebrated botanist, Dr. Geo. Engelmann, departed this life at his residence in the city of St. Louis, on the evening of the 4th of this month, at the age of 75 years and 2 days.

He was born at Frankfurt on the Main, and received the first rudiments of his education in the schools of that city. It was there also that, in intercourse with many persons of eminent attainments in natural history, he received his first impulses in the direction of botany. In the spring of 1827, at the age of 18 years, he entered the University of Heidelberg, where, with marked success, he pursued medical studies, giving special attention to botany and chemistry, being associated with L. Agassiz, A. Braun, C. Schimper, all of whom were destined to world-wide renown, the first in zoology and the last two in botany.

In the autumn of 1828 he went to Berlin, where, for two years, he devoted himself exclusively to the study of medicine. He was then, by Prof. Schölein, attracted to Würzburg, where he took the degree of M. D. in 1831. The next year was spent in Paris, still pursuing medical studies and completing his professional education.

At about this period the socialist Duden had created a sensation among the better educated of the malcontents of Germany by his thrilling and seductive descriptions of frontier life in Missouri.

The young physician and naturalist soon after set forth across the Atlantic, and arrived in St. Louis in February, 1833. Taking up an abode with relatives who had already settled there, he devoted the first two years of his residence to acquainting himself with the manners and customs of the frontier. Later he traveled on horseback southward into Arkansas and the Indian territory, returning to St. Louis at the end of 1835, and engaging in the practice of medicine.

As a naturalist he was deeply interested in all those exploring expeditions which were dispatched from St. Louis between 1840-1850.

He was the special friend of Nicollet and Fremont, those ardent explorers of the then almost unknown world of the upper Missouri and Mississippi regions.

From the date of his arrival upon the banks of the Mississippi he began those studies upon North American botany in which he was destined to achieve such high distinction. He also began, and for nearly half a century continued, a meteorological record of the region of St. Louis.

As early as 1836 he made an effort to organize a society of naturalists in his adopted city, proposing for it the name of the Western Academy of Sciences. The movement was premature, and it was not until twenty years afterwards that the Academy of Sciences of St. Louis was organized, of which he was the first president, also filling that honorable seat during many succeeding terms, and enriching the Academy's proceedings from time to time with his masterly monographs.

Other scientific organizations at home and abroad were forward in honoring him with elections to membership. Among them we may name the following: The Natural History societies in Mainz, Freiburg, Hamburg and Vienna, the Academy of Science of Philadelphia, the Lyceum of New York, the Society of Arts in Boston, the Philosophical Society of Philadelphia and the National Academy at Washington and the Linnean Society in London. On the first appearance of his earlier contributions to North American botany, Robert Brown, at that time the first of living authorities, expressed himself amazed at the appearance of such botanical erudition from the west side of the Mississippi in America. In both the natural and acquired abilities of a great systematic botanist it is safe to say that Dr. Engelmann was second to none who lived contemporaneously with him on our side of the Atlantic at least. If he has left behind him no ponderous volumes of standard works, it has been because his life was chiefly devoted to the duties of the medical profession.

Botany (in which he accomplished, after all, so very much that it is chiefly as a botanist that his fame will be immortal), was only his recreation—his pastime when each day's professional labor was ended. But his recreations bore every mark of close, careful and conscientious investigation and the most consummate scholarship. No botanical author of our time was farther from being a mere smatterer; indeed, the works of no other whom we can name bear the impress of so high a degree of discrimination and such thorough and patient study.

Whenever to any of us, his pupils and correspondents, it became known that Dr. Engelmann had taken in hand the monographing of any particular genus, we were always accustomed to say to ourselves that whenever the monograph came out we should have the best possible work on the subject. His masterly power displayed itself in the selection he made of the genera to be treated.

For thirty or forty years past he has distinguished himself by taking in hand such subjects as the other great botanists of America have seemed afraid to lay hold upon.

If there is one North American Natural Order more difficult of treatment than all others, it must be the Cactaceae of our southern and southwestern territories. In this order, Dr. Englemann was the only man who did anything. Of all the species of the cactaceae Dr. Englemann is the author. I doubt if there is one exception, except Nuttall, who was of an earlier generation of botanists, and to whom, moreover, of such knotty genera as *Juncus*, *Cuscuta*, *Isocetes* and several more, now that Dr. Englemann is departed, whom we can appeal to as knowing or claiming to know anything about them?

All of his contemporaries, the most distinguished and able not excepted, were glad to turn over to Dr. Englemann's treatment, every genus which he expressed a willingness to take in hand; and none were found who could criticize his work when done.

During the later years of his life, after having retired from the practice of his profession, he made several trips to the Rocky mountains and westward, having given himself to the study of the oaks, pines, spruces, cedars and other forest tree genera, which were greatly in need of thorough and careful study. One of these excursions was extended to this coast. He passed some time in the Sierras and along our shores, in the summer and autumn of 1880.

His main object in coming was to learn more about our oaks and pines, in which he had long been specially interested.

He remarked, half jestingly, on this floor, that he had supposed, formerly, that he knew something about our Pacific coast oaks (though they are a most difficult family to handle scientifically), but he said that after having seen them in their native haunts, and noted their almost countless forms, he began to think that he knew very little about them.

Numerous genera in our volumes of the Botanical California have been elaborated by him. His work upon the cactaceae, oaks, pines and spruces, be did not consider at all complete. He only professed to give us the best elucidation of the species, which our collected materials, enlightened by his own, necessarily limited personal observations rendered possible.

When, last summer, we heard that he was ill in Heidelberg, we who knew his advanced age, thought it probable that he would not be permitted to regain our shores. But he rallied, and came back in good health and spirits, and there seemed reason to hope that more years of his valuable labors would be vouchsafed us.

Suddenly, now, he has fallen asleep. He has been gathered to his fathers; his work is done; and yet not done, for no man's work, who wrought with zeal, and care, and diligence and perseverance like his own, is ever, to his own thinking, done.

Yet who, among ourselves, we can but ask, shall be found worthy to complete what he has left unfinished?

Note.—That portion of the above sketch which relates to Dr. Englemann's early life, was translated from a German newspaper, by Dr. H. H. Behr.

An Important Find.

About one month ago an important discovery was made by Samuel Carson, on his land at Tejuanga, about twenty-five miles from this city. The peculiar character of the mineral attracted his attention, and upon investigation it was found to be graphite of a superior quality. Specimens were brought to town, and resulted in A. W. Potts, A. M. Reed and Wm. Osborn becoming interested in the mine, and work actually proceeded with. A tunnel is being run so as to cut the ledge, and the results produced are beyond the most sanguine expectations of the owners. The ledge is estimated to be forty-two feet wide, and can be traced a considerable length by the croppings. The mineral is taken out in an almost pure state, is easily worked, and is destined to be in considerable demand as soon as its merits are brought to the attention of manufacturers. Mr. Potts sent a specimen to Dallas, Texas, and an answer in reply stated that it was the best article of graphite that had ever been received at the factory there. It is the intention of the owners to send a huge specimen to Faber & Co., the great manufacturers of lead pencils, and if the article is what it is supposed to be, and is considered favorably by that firm, regular shipments will be made to them. The mine is only twelve miles from the railroad, and will, in the course of time, prove to be a great property. Besides being used in the manufacture of lead pencils, paints and stove polish, it has been demonstrated that it has no superior as a lubricator for machinery, and had been successfully tried in mills in this city.—Los Angeles Times.

MECHANICAL PROGRESS.

Welding Properties of Different Irons.

We find in the *Annals de l'acier* a very interesting article by M. Ledebur, professor at the Friedberg School of Mines, on the relations which exist between the purity of iron and its welding. Compared with metallic alloys, iron mixed with foreign bodies presents, from the point of view of physical properties, very close analogies. Every alloy of two metals gives a harder composition, with greater power of resistance, than either of the metals taken singly, but malleability diminishes and brittleness increases. With regard to points of fusion, it is known that the point of fusion of an alloy is always below the mean of the points of fusion of the metals of which it is composed, and often even inferior to that of the most fusible. In the case of iron, all these phenomena are produced with the greatest exactness; if, for instance, carbon be combined with iron, the hardness and brittleness augment; the resistance, which increases at first, rapidly obtains a maximum and then diminishes. When two pieces of iron can be united in one by pressure at a certain temperature, it is said that the iron is weldable. To accomplish this, the iron must pass into a state of softness and a pasty consistency, which favors the union of the molecules when accompanied by pressure, and more progressively this passage from the solid to the liquid state is made, the more capable is the substance of being welded. Thus, decarbonized iron is generally more malleable than steel, which is but little so, and than pig, which is not at all so. When the proportion of carbon with the iron augments, the point of fusion of the metal obtained diminishes, and the hardness and brittleness increase, but as the time for passing from the solid to the liquid state diminishes, it follows that the welding is performed with less ease.

Soft cast iron is always much less weldable than forge iron properly so called. According to M. Ledebur, who divides in categories the various shades of soft metal, we ought to understand by "weldable" that which is so with or without precautions, and by being not weldable, that which welds badly or does not weld at all. It seems to result from the investigations of M. Ledebur that the sum total of foreign bodies in soft non-weldable metal is about 70 per cent above that which is in weldable steel. After having occupied ourselves with the carbon, and having indicated that to obtain a good welding it is necessary that the iron should contain a small quantity of this substance, much below 1 per cent, we proceed to pass in review the influence which other bodies generally found in the iron have on welding. With regard to silicon it is desirable that the iron should contain a small quantity, though its influence is less than that of carbon. The influence of phosphorus is rather advantageous in puddled iron from the point of view of welding. On the contrary, in soft cast iron it seems that phosphorus may be disadvantageous. If we remember that with an equal quantity of phosphorus puddled iron is poorer in other foreign bodies, particularly carbon, than soft steel, since the less carbon there is in the iron the less influence foreign bodies have, we shall perhaps find the most plausible explanation of this practically undeniable fact.

With regard to manganese, it is probable that its presence in the iron is more injurious than advantageous to welding. The following are the conclusions arrived at by M. Ledebur: (1) The purer the metal is the easier it is to weld; (2) phosphorus is more troublesome to steel than to puddled iron; (3) manganese, silicon and carbon are obstacles to welding; (4) a proportion of oxygen not reaching .07 per cent has not the same influence over the welding of steel as an equal quantity of manganese, silicon and phosphorus.

MACHINERY AND THE HAND.—It has taken years of improvement to make headway against the strange notion that improved machinery and mechanical processes work against the workman. It has been the cry at every new step in advance that it would be the death-blow to some industry formerly carried on by hand. The locomotive was to do away with teaming. The sewing machine was to be a foul crime against the welfare of the seamstress. The reaper and mower were to interfere with the rights of the sturdy swathe-cutters of the farms. In short, every such advance has been met by just such objections. Yet there is less poverty, less squalor, less ignorance and less idleness among the laboring classes in our age, which is the age of invention, and in our land, the land of inventive genius, than in any other age or land the world has ever known. Milling processes have been so lately and so rapidly improved that they have suffered less obstruction than many others. Still there has been a vast amount of very foolish talk about this branch of trade, and there still is. Yet not the least valuable effect of modern mechanical improvement has been the broadening of the ideas and the general improvement of mind it has brought to that very conservative class of men, the millers. The almost incredible opposition suffered by Oliver Evans would be an impossibility in 1883, and we may view this fact with satisfaction as

indicating the enlightened condition of the present generation of millers.—*Roller Mill.*

POUNDED CAUSED BY CHANGING VALVE MOTIONS.—Many engineers alter their valve motions and thereafter have trouble from pounding. Engines which ran silently, so far as pounding was concerned, begin to protest against the new condition of things so soon as the times of the valves are changed. This is to be expected, but of the two evils, waste or noise, the latter is the least; that is to say, if cards show that steam is being used wastefully, and corrections are made, it is natural that an engine should pound, and for this reason. The bearings and connections are all worn to suit the old state of things. Wherever the greatest pressure came before the valves were altered there the greatest wear will be found. Change the times of the valves and the greatest pressures come at another point in the stroke, earlier or later, as the case may be, and the result is thumping. This is one cause of unpopularity of taking off compression of the exhaust from an engine. So soon as this is done in an engine which has always run under a high degree of compression it pounds badly, and the engineer says it was just what he expected, and that an engine can not be run without compression, and run silently. The troubles in such a case, as we have mentioned, lie not in the want of a cushion for the piston to bring up, but in the bearings and connections. These should all be bored out and refitted where compression is taken off, and, probably, the crank pin tried up. Among the leading high-speed engine builders, the amount of compression is decreasing rapidly. Cards before us from four of the largest concerns, makers of 700 to 800 H. P. engines, show from very slight to none whatever.—*Mechanical Engineer.*

BUILT UP WOOD. A very strong and durable material is constructed in the following manner: Several thin sheets of veneers, an eighth of an inch thick are glued one upon another, with the grain of each sheet crossing the grain of the sheet next above or below it at right angles; and, when the whole complex fabric has lost all power of resistance through being almost saturated with steaming glue, it is pressed into an almost homogeneous board without any cleavage whatever, and so without possibility of splitting. Every sort of wood, of course, can be built up. The inside layers can be cheap and the outside choice. No matter whether or not the different sheets naturally swell and shrink evenly together. They are too thin to exert much force. Their separate identities are lost in the common and overmastering union. The advantages of economy, strength in every direction, and immunity from cracking are enough to give the fabric the readiest possible acceptance for whatever uses in may be adapted. It is already in use for broad, flat surfaces in cabinet work, especially where strength or permanence is wanted. It already competes with canvas for the use of artists, and with binders' board for book covers. Its availability for any purpose appears to be a matter of expense and skill—never of quality. That it will be adapted to many uses not now thought of is as sure as the inventive fertility of our mechanics.

MECHANICS WHO RISE.—There is a large sized nugget of truth in this from Dr. J. M. Buckley's series of "Letters to Young Men": "Benjamin Franklin told the truth when he said that the best knowledge a man could give to his son was the mastery of a good trade. Such a man is a cosmopolitan. He can make himself useful anywhere, and he can live anywhere. If it should not be necessary always to work at his trade, he feels the ability within to support himself. * * * Between the average mechanic and the great manufacturer or merchant prince great numbers can be found who began as mechanics and who have taken positions by their mechanical skill fully equal to that of the average merchant and far superior to that of most clerks and professional men. * * * Always have in view rising above the position of a mere journeyman. Look at things from a broad business point of view. Consider that some day you may not be a journeyman, and try to study the relations of capital to labor and to master the principles of business, so that if you should ever form a partnership with a business man you will not be at his mercy, and so that, if you choose, you may at any time enter upon business for yourself, and not fritter away your life in a vain effort to overcome by mechanical skill financial obstacles." Every young mechanic should cut out the above extract and tuck it up over his bench. It is too good to be lost.

AN IMPROVED CANNON.—At the French gun factory near Lille has recently been finished a cannon which presents some peculiarities of proportion and shape, but whose chief novelty is a compact wrapping of fine wire around it as tightly as possible by an engine constructed for the purpose. Preliminary tests have shown that the resisting strength of the gun metal is more largely increased by this device than it could be from an equal weight of similar metal cast with the tube itself; but whether or not the wire will stand the strain of continued use can only be decided by the severer tests which are now about to be applied.

SCIENTIFIC PROGRESS.

What is Electricity?

Electricity is the most stupendous force in nature, apparently active throughout the universe, the cause of the phenomena described as attraction, gravitation and magnetism, and most probably of heat and light. It is incessantly active, and maintains, it would seem, the physical life of the world. Science can only appreciate some of its results, and apply it on a very limited scale to practical purposes; but knowledge of its adaptability is growing every day, and what a few years since was little more than material for brilliant laboratory experiments or the production of scientific toys, is now becoming a gigantic motive power available for the service of practical science and the progress of civilization.

Already it provides a means of instantaneous communication between portions of the earth's surface, most remote from each other. It is gradually superseding all other methods of artificial illumination, and it promises to make steam obsolete as a motive power. What other aid it may give, we know not, and we scarcely dare conjecture, although it would seem that the most vivid imagination must fail to apprehend its possibilities. It is in the earth beneath us, known as terrestrial magnetism; it is in the atmosphere around us, and its energy is seen in the lightning flashes which mark the discharge of force between clouds, each of which is a storage of force; and in the vast, indeed inconceivable, kosmos, electricity maintains the relations of suns and systems moving with enormous velocity and unvarying regularity through space. It is a force which, so far as human intellect can appreciate it, knows no cessation, diminution or deterioration. It can be summoned but not created by any skill of man—made apparent in the results of friction or chemical action, but made apparent only, not produced. A spark the eighth of an inch long, produced by contact with the small electric machine in the lecture room is precisely similar in character to the terrible flash which splits a tree to fragments, striking it with sudden death, or topples down the most massive tower reared by the skill of man. In Oriental fable, we read of lamps, the rubbing of which produced an obedient genius ready to minister to every wish. We can excite the electric force, and the most stupendous of all the genii nature—if not, indeed, the master-spirit, of which all known natural forces are but variations—is at our service; our servant, if we will—our most terrible master if we have no skill to conciliate him.—*Beeton's Dictionary of Science.*

THE WESTERN MOUNDS.—More than usual attention is now being given to opening and preserving the contents of the earth-mounds which are so plentifully scattered throughout the Western and Middle States. Professor Norris, the ethnologist, who has been examining mounds in West Virginia for several months, recently opened a large mound six or eight miles from Charleston. The *Call* of that city says: "This is the largest mound in the valley, and proved a rich store-house. The mound is fifty feet high, and they dug down to the bottom. It was evidently the burial place of a noted chief, who had been interred with unusual honors. At the bottom they found the bones of a human being, measuring seven feet in length, and nineteen inches across the shoulders. He was lying flat, and at either side, lying at an angle of about forty-five degrees, with their feet pointing toward their chief, were other men—on one side two and the other three. At the end of the chief lay another man, with his hands extended before him; bearing two bracelets of copper. On each side of the chief's wrists were six copper bracelets, while a looking-glass of mica lay at his shoulder and a gorget of copper rested on his breast. Four copper bracelets were under his head, with an arrow in the center. A house twelve feet in diameter and ten feet high, with a ridge-pole one foot in diameter had been erected over them, and the whole covered by the dirt that formed the mound. Each of the men buried there had been inclosed in a bark coffin."

COLORS OF LEAVES AND FLOWERS.—Though the colors of leaves and flowers depend on light, the process of coloring is a vital one, and, like all exhibitions of vital power, depend directly on nutrition. It has been shown by observers in our own country that even the color of autumn leaves cannot be examined without taking nutrition into consideration. The colors of flowers in high latitudes, as compared with those of the same flowers of lower elevations, are higher, simply because of variable drains on nutrition. Professor Henshaw has recently reverted to this peculiar relation of light to nutrition in the colors of flowers by comparing the common lilac and the hyacinth. If the purple variety of the former be made to bloom in darkness it becomes wholly white, but the purple or other colored hyacinth retains much of its color when made to bloom in the dark. The reason is presumed to be that the flowers of the lilac

as they develop have to perfect nutrition from the atmosphere, which they cannot do without the aid of light, while in the case of the hyacinth it has been fully perfected and stored up in the bulb the season before. This is equivalent to saying that the bulb can go on growing in a much more nearly perfect manner without light than the lilac can.

A NEW SOUNDING LEAD.—An ingenious sounding lead, enabling the determination of the exact moment of its arrival at the bottom, by means of an electric-alarm bell, is described in a recent issue of *London Engineering*. The sounding line, as there stated, is in reality a cable containing two wires, which form the circuit of the bell. It is attached to the ring of the lead at one end, and to the hauling winch on board ship at the other. The lead itself consists of two parts, the lower being hung from the upper by four stems which slide in mortise grooves cut in the sides of the upper part. Its bottom is furnished with the usual hole, containing tallow to catch specimens off the bottom. The upper part of the lead, which hangs from the line by the hook already mentioned, is a heavy mass of lead, and a hollow through its interior contains an electric contact terminating the ends of the two conductors of the cable. This contact is closed by a stem or plunger attached to the lower movable part of the lead. When the lead strikes the bottom the plunger is driven up the hollow in the upper lead, and establishes contact between the ends of the two conductors, thereby completing the circuit of the bell, which immediately rings on board the vessel, indicating that the bottom has been reached. The contrivance, as will be seen, embodies several points of interest, and may perhaps prove of some value in more accurately determining depths than has thus far been the case.

A WHITE RAINBOW.—On the morning of November 28th, at 9:41 o'clock, Paris time, M. Cornu, the French astronomer, observed at Courtenay (Loiret) that rare phenomenon, a white rainbow, an account of which he has lately furnished to the French Academy of Sciences. The sun, which was very pale, rose in the midst of level bands of cloud. A thick, hoar frost covered the ground, and a light fog thinly veiled the sky, which was clear of clouds toward the zenith. Opposite the sun a great white arc without a trace of iridescence was figured on the fog.

ATTRACTION AND REPULSION OF BODIES IN MOTION.—The attraction of a light balanced body to a vibrating tuning fork was shown in a recent lecture in New York by Dr. Monkmann; also the attraction between two disks of paper revolving parallel and in the same direction. The lecturer also showed that two smoke or steam rings, traveling abreast and in the same direction, attract each other; also, that two paper rings, revolving in the same direction, attract each other when moving close together, while if they revolved in opposite directions they repel each other.

CAUSE OF THE ISCHIA DISASTER.—The volcanoes have a good deal of business put upon them just now, between earth and sky, but it is doubted in well informed quarters if the disaster at Casamaccia was at all due to volcanic agency. It is said that the delicate apparatus on Mount Vesuvius, which is arranged to give warning of any change in the stability of the surface, showed no signs of any perturbation. The newer, and apparently better founded theory is, that the ground was undermined by the action of hot springs, and that the town stood upon a mere crust of earth, which gave way at the time of the disaster.

ALCOHOL IN A BUSHEL OF GRAIN.—Corn affords 40 lbs. of spirits of the specific gravity of 0.9427, containing 45 per cent of absolute alcohol for each 100 lbs. of grain; wheat, 40 to 45 lbs. of spirits, barley 40, oats 36, rye 36 to 42, hucklewheat 40. Now 40 lbs. of such spirits equal 3½ gallons of government proof spirits. It is computed that 1,000 gallons of alcohol are evaporated daily, in New York alone, in the baking of bread. A trial to save the alcohol in one case of testing resulted successfully, so far as securing the alcohol, but the bread was made tasteless by the process.

IMPORTANT DISCOVERY IN PHOTOGRAPHY.—E. W. Fellows, Cleveland, Ohio, after experimenting for two years, claims to have succeeded in inventing a way to take instantaneous and absolutely permanent photographs upon anything having a smooth surface, by the action of electricity. The expense is less than one cent for each picture. If all that is here claimed is true, this invention will revolutionize photography.

A NEW STORM INDICATOR.—A French meteorologist has, in the exposed court of his house, two bars of iron planted in the earth, to each of which is fixed a conductor of coated wire, terminating in a telephonic receiver. His practice is to consult the apparatus every day, and it never fails, through its indications of earth currents, to give notice of the approach of a storm twelve to fifteen hours ahead.

SAN FRANCISCO:

Saturday Morning, March 1, 1884.

TABLE OF CONTENTS.

EDITORIALS.—Foundry Notes; Chlorination of
Ore; A Flue Covering; Water Rights and Mining
Claims, 153. Passing Events; A New Mineral; Nat-
ural Cementation of Copper; The Mineral Land Bill,
154. Annual meeting of the San Francisco Micro-
scopical Society, 156.

ILLUSTRATIONS.—The Macbeth Steel Pulley;
Vat for Chlorination of Ore; Covering for Horizontal
Flues, 153. National Bolt Cutter; National Head and
Lathe Vise, 157.

CORRESPONDENCE.—Bodie, 154.
MECHANICAL PROGRESS.—Welding Prop-
erties of Different Irons; Machinery and the Hand;
Pounding Caused by Changing Valve Motions; Built
Up Wood; Mechanics who Rise; An Improved Cannon,
155.

SCIENTIFIC PROGRESS.—What is Electricity?
The Western Monads; Colors of Leaves and Flowers;
A New Sounding Lead; A White Rainbow; Attraction
and Repulsion of Bodies in Motion; Cause of the Ice in
Disaster; Alcohol in a Bushel of Grain; Important Dis-
covery in Photography; A New Storm Indicator, 155.

USEFUL INFORMATION.—Tempering Glass; A
New Fire Extinguisher; Preserving Harness; Cannons
of Silk and Steel; Vegetable Silk; To Measure for Belt-
ing; Artificial Marble, 159.

GOOD HEALTH.—Photography in Hospitals; Cop-
per in the System; Medical Value of Lemons; Crema-
tion in America; How to Treat a Sprain; Corsets for
Girls; Removal of Freckles; Short Dresses for Children;
The Physical Cause of Yawning; Soda for Burns, 159.

MINING SUMMARY.—From the various counties
of California, Nevada, Arizona, Idaho, Montana, New
Mexico, Oregon and Utah, 161-62.

MINING STOCK MARKET.—Sales at the San
Francisco Stock Board, Notices of Meetings, Assess-
ments, Dividends and Bullion Shipments, 163.

MISCELLANEOUS.—The Late Dr. Engelmann; An
Important Find, 154. Reissue Patents; Building
Stone on the Pacific Coast, 158. A Notable Literary
Workshop, 159.

Passing Events.

We have had phenomenally hot weather for
a week past, for this time of the year, but it
has been good for the country, after the copious
rains. Everything is growing fast and if we have
no bad frosts we are sure of a very good year.

We give considerable space this issue to the
report of the Manufacturers' Association, a new
and growing organization composed of the best
of our citizens. They are in earnest in foster-
ing the home industries of the Coast and will
adopt vigorous measures to protect and en-
courage our manufacturing interests.

The gold fever about the new Idaho fields
increases instead of abating and in a few weeks
thousands will be on their way to Cen-
tral Idaho.

In the Superior Court of Santa Clara county,
Dora A. Bunt and Mary Dora Bunt, by Dora A.
Bunt, guardian *ad litem*, have brought suit
against the Sierra Butte Gold Mining Company
(Limited) of Sierra county. William J. Bunt,
the father and husband of the plaintiffs, was
killed in a tunnel of said company on the 4th
day of October, 1883, while he was working a
drill in said tunnel, he being an employee of
the Sierra Butte G. M. Co. The complaint says
that defendant's servants recklessly, carelessly
and negligently took supporting timbers out
of the tunnel, causing a cave and killing William
J. Bunt. The amount sued for is \$30,000.

Work on the artesian well at Logan (Quijotoa)
continues, and is being pushed as fast as
possible. The number of men at work on the
mines has not been increased, and cannot be
to any great extent for some time to come.
There is no chance to get work in the mines,
but the rush has set in and will not stop till all
who have the Quijotoa fever have reached the
camp and had a look for themselves.

A New Mineral.

A new mineral called "Colemanite" was found
not long since in the southern part of this State,
and named in honor of Wm. T. Coleman, of
this city. It is a hydrous-borate of lime.
There are several minerals of somewhat similar
composition, and its affinities are shown in the
following schedule:

Ulexite.....	2CaO	15.9
	Na ₂ O	8.8
	5B ₂ O ₃	49.7
	10Aq	25.6
Bechillite.....	CaO	20.89
	2B ₂ O ₃	52.24
	4Aq	26.87
Colemanite.....	2CaO	27.18
	3B ₂ O ₃	50.98
	5Aq	21.84
Pandermite.....	2CaO	29.78
	3B ₂ O ₃	55.85
	3Aq	14.36
Priceite.....	3CaO	29.9
	4B ₂ O ₃	49.8
	6Aq	20.3

The clearest crystals obtainable contained
small quantities of soda, varying from 26-100
per cent to 54-100 per cent, reckoned as caustic
soda, but undoubtedly present as borate of soda.
This is probably a mechanical admixture, and
does not enter into the mineral as an
essential element. It points, however, very
strongly to the origin of the mineral from
ulexite. By inspection of the formula, we
observe that if the soda be abstracted from
ulexite along with its equivalent of boric
anhydride (2 B₂O₃), there remains a compound
identical with Colemanite or pandermite in its
ratio of boric acid to the lime. In fact, both
Colemanite and pandermite have been produced
artificially by deposition from aqueous solu-
tions of ulexite, the temperature alone deter-
mining the degree of hydration. Under vary-
ing conditions of temperature, concentration
and pressure different and yet closely allied,
hydrous borates of lime would be deposited,
and this might take place in quick succession
or even simultaneously in different portions of
the same bed or ledge. These borates are thus
very closely allied in their origin, and are
liable to glide one into another by insensible
gradations. Hand specimens are found having
all the appearance of ulexite at one extremity
and Colemanite at the other. This may account
for some of the apparent discrepancies in the
analysis by reputable chemists. Pisan's
analysis of pandermite (quoted by the State
mineralogist), is that of a Priceite pure and
simple.

Specimens of borate of lime having all the
appearance of the massive variety of Colemanite,
have given results, on analysis closely agreeing
with the formula of Priceite.

As far as we are informed, Colemanite is the
first definitely crystallized borate of lime hith-
erto found.

With reference to its susceptibility of reduc-
tion to boric acid or borax, practical tests have
shown it to be quite refractory.

A paper describing this new mineral was
read at the last meeting of the California
Academy of Sciences by J. T. Evans as follows:

COLEMANITE.—Crystallization monoclinic. "In-
clination of the vertical to the clinodiagonal
axis (C) 70° 1' A 1 108°. ii Δ 1 144° ij Δ 1
126°. Lustre vitreous to adamantine, often
splendent. Cleavage ij or clinodiagonal per-
fect, affording readily thin, smooth and polished
laminae which often show interference figures.
Cleavage in other planes imperfect and fracture
uneven, giving surfaces of a subvitreous luster.
Hardness 3.5 in the amorphous to 4.25 in the
crystalline variety. Sp. gravity 2.428. Color-
less, streak white. Transparent, subtranslu-
cent to milky, especially in the massive. Rather
brittle.

Composition, 2CaO, 3B₂O₃ + 5H₂O.
Anhydrous boric acid..... B₂O₃ [50.98]
Lime..... CaO 27.18
Water..... 21.84

Total..... 100.00

Pyr. Decrepitates violently and at length
sinters. With fluor spar and bisulphate of potash,
colors the flame yellowish green. Soluble in
dilute hydrochloric or nitric acid with deposi-
tion of flakes of boric acid in abundance.

Locality, Southern Cal., where it was dis-
covered by R. Nenschwander, October, 1882.
Named after Wm. T. Coleman of San Fran-
cisco.

The notation is conformable to that of Dana's system
of mineralogy.

Natural Cementation of Copper.

Heavily sulphuretted ores of iron and copper
readily undergo decomposition, the sulphur being
oxidized into sulphuric acid, which attacks the
simultaneously oxidized iron and copper, form-
ing soluble sulphates of these two metals.
Under the combined action of heat and mois-
ture the sulphatization takes place actively in
certain mines, the water flowing from which
carries a notable amount of copper. To save
this it is conveyed through tanks filled with
iron, whereby the copper is recovered as metal-
lic precipitate (cement copper). In Europe
many hundreds of tons of copper are precipi-
tated annually from the water flowing from
certain mines. The water from one mine yields
.264 pound of iron and .032 pound of copper
per cubic foot, or .5 per cent of copper. As
there is always a large amount of free sulphuric
acid in these waters, the consumption of iron
is largely in excess of what is required merely
to precipitate the copper. Mr. James Douglas
Jr., says that from a neutral solution 87
parts of iron will precipitate 100 parts of cop-
per, but from the acid liquors of the mine here
referred to, it required, in 1859, 5,598 cwts. of
iron to precipitate 2,153 cwts. of copper, or 260
parts of iron to 100 parts of copper.

This same reaction by which the sulphurets
in mines are being deprived of their copper is
taken advantage of to extract the copper from
iron pyrites low in copper. For instance, at
some mines in Spain and Portugal, large heaps
of fine ore accumulate carrying about two per
cent of copper. These are simply wetted,
preferably by water thrown with violence from
a hose, which carries mechanically some air into
the heaps. As a result, in that warm climate,
disintegration and decomposition proceed so
rapidly that the copper is virtually leached out
from the heaps in about two years and recov-
ered by precipitation on iron. In this country
a very old industry has been the manufacture
of copperas from the crude pyritous ores of the
Copperas Hill, Vt., which are decomposed
slowly even in that cold climate by atmospheric
agency.

The Mineral Land Bill.

The California Mineral Land Indemnity Bill
came up in the U. S. Senate on Tuesday for
final passage. Senator Plumb presented a sub-
stitute for the bill, which he said was the same
as the bill reported from the Committee on Pub-
lic Lands last session. It was designed to com-
pass such points as the bill before the Senate,
but was not, he said, open to the same objections
as the latter, namely, permitting the taking of
a section of land in any part of the State. Sen-
ator Miller said the original bill was intro-
duced by him at the request of the Governor
and Attorney-General of California. It was
not his own measure, therefore, and he had no
objection to the amendment offered by Mr.
Plumb. Garland, of Arkansas, wanted to
amend Plumb's substitute after it had been
read, and was allowed to do so. He moved to
strike out the words "shall be construed as
given," and insert "was intended to give,"
where these words define the object of the origi-
nal granting act. Garland's motion was agreed
to, and the bill passed without debate as
amended by Garland. The bill now reads as
follows:

Be it enacted, etc., that an Act entitled "An
Act to provide for the survey of public lands in
California, the granting of pre-emption rights
therein, and for other purposes," approved
March 3, 1853, was intended to give the State
of California the right to select for such pur-
pose other lands in lieu of such sixteenth and
thirty-sixth sections as may have been or shall
be found to be mineral lands; provided, that
such indemnity sections shall be made under
the limitations contained in said Act from the
public lands of the United States in the State
of California subject to entry under the general
laws, and not mineral nor occupied by actual
settlers, nor reserved for any other purposes,
nor appropriated under any law of the United
States.

FOLLOWING is a specimen of the puffs given
to stations near the Cœur d'Alene country by
papers in that section: "Persons waiting to
buy or lease on speculation have a good oppor-
tunity now, as lots have been sold, and in 24
hours have changed hands at a margin of from
100 to 300 per cent. Belknap is bound to be
a second Denver, and in 60 days will have a
population of 10,000."

DURING the past four days the Denver and
Rio Grande has brought to Salt Lake over five
hundred people from Colorado points. Their
destination is the Cœur d'Alene.

Annual Meeting of the San Francisco Microscopical Society.

The annual meeting of the San Francisco
Microscopical Society was well attended and
considerable interest manifested. Col. C. Mason
Kinne, President, occupied the chair, and
among those present was A. H. Breckenfeld, of
San Francisco, a newly elected resident member.

The President's Address.

The President delivered his annual address,
as follows:

GENTLEMEN:—This meeting closes the twelfth
year of our organization as an earnest, enthusi-
astic and working society. The few of us who
have been with it from the first, can
look back through the several years with
more than pardonable pride, and while it
is a duty devolving on the President to give a
brief statement of the doings of the past year,
it becomes a pleasure when I look beyond the
twelve months and think of what this organiza-
tion has aided to accomplish. As we enter
upon the thirteenth year, the past may be a
safe augury of what our members can do in the
future. The original investigation and personal
research into new fields, of which our State is
so prolific, combined with the study and pro-
mulgation of such facts as naturally pertain to
the microscopical branch of scientific knowledge,
has made a record for the San Francisco Micro-
scopical Society which many of the older socie-
ties point to with satisfaction, and as worthy
of emulation.

As to the record of the past year, it becomes
proper for me, first of all, to say that the unex-
pected resignation of President Ashburner in
May last was regretted by me, not only in the
fact of our being no longer permitted to enjoy
his presence among us, but more personally
from the fact of your taking advantage of my ab-
sence from the next meeting and there throwing
the executive mantle on my shoulders, without
permitting a declination of the honor. My ad-
ministration of four years ago, as President, I
do not feel was so productive of results as to
have warranted such an expression of confi-
dence, except that perhaps my address at the
close of the term was so pointed at your general
ability to do, but personal unwillingness to ac-
complish many of the things that lay before
you, and which would redound to the great ad-
vantage of our association, that possibly I there-
by aided in awakening a little more interest.
Certain it is that of late we have begun to show
some of the old-time spirit, and papers and lec-
tures from meeting to meeting have betokened
a renewed interest in such matters as prop-
erly pertain to a society like ours.

Meetings and Membership.

During the year which closes to-night, we
have held our regular semi-monthly meetings
with a generally good attendance. The num-
ber of visitors attending by invitation has not
only been greater than in many former years,
but they have betokened a bright interest in all
that has come up before us.

We have elected but four resident members
and three have resigned for various good rea-
sons. We have elected two corresponding
members. Mr. C. H. Denison who is now one
of our corresponding members, departed for the
East soon after his resignation as a resident
member, and his regular attendance and fre-
quent papers on various subjects are missed by
us all.

We have lost one member by death—Mr.
Geo. H. Williams. He died quite suddenly and
his unexpected removal from our midst cast a
feeling of sorrow over all. He had been one of
us for some eight years and was always es-
teemed as one of our most earnest and faithful
members, and while not prolific in papers or
lectures, he did good work in a quiet way for
the advancement of all our mutual interests.

Cabinet and Library.

Constant accessions to our cabinet of slides
and general objects have been received, and
besides the periodical microscopical and other
scientific literature, we have acquired by pur-
chase and donation many valuable and instruc-
tive volumes.

This material and palpable increase to our al-
ready large and varied cabinet and library has
been fully equalled by the mental information
given us by the informal discussions at our
meetings of many of the topics naturally within
the range of a society like ours. The exhibition
of a slide prepared at the hands of this or that
member, and the remarks incident to its pre-
sentation, have frequently called out suggestions
and ideas from those present which have result-
ed in the usual spontaneous information, which
arises from imparting one's own experience with
the same or kindred matter.

Added to these impromptu topics, which
ranged from diatoms to cosmic dust, graphi-
ology to ancient mosaics, and algae to accessories,
we have been favored with several

Papers and Lectures

Prepared for the occasion. Mr. Hanks' paper
on "Some Notable Features of the Great Snow-
fall of December 31, 1882, in San Francisco,"
was presented in that gentleman's usual inter-
esting style, with many valuable deductions
from the result of his investigations of the
matter. His careful analysis of the residuum
after evaporating the water, coupled with the
information he gave of sand and dust storms in
various countries, made it one of the best pa-
pers of the year. We trust that his promise to

give us a paper relating to the phenomenal "Sunset Glow" of past months may be speedily fulfilled.

Professor Ashburner, before his departure from among us, favored the society with a valuable lecture on "Angular Aperture," a subject in which he is at home, and was handled in his ready and understanding manner.

The exhibition by Mr. Banks, of "Cole's Studies in Microscopical Science," was productive of a request that he illustrate the same with the microscope, which he did at the next meeting with an array of seven of our favorite instruments. Mr. Banks' earnestness and never-failing attendance at our meetings is worthy of being copied by those of our members who can do something, but accomplish little in the way of keeping up the *esprit de corps* of our gatherings.

Vice-President Norris has pursued his favorite occupation of cleaning and mounting the delicate diatom and we have been favored with his production and remarks regarding their preparation, on various occasions.

Dr. Behr responded to our request in the matter, with a paper giving a technical description and identification of an insect of the genus *Matilla*, besides much information at various times of subjects entomological.

The valued accession to our ranks last year of Dr. Sternerberg, U. S. A., has fully warranted our faith that it would be good to have him among us. At stated periods he has addressed us on many interesting subjects. Among the most notable, I find that of "Atmospheric Dust and Disease Germs, including the present state of inquiry into the cause of Diphtheria," also "Micrococci," "Unicellular Organisms" and "Minute Animal Organisms." At another time he exhibited "living specimens of pond life, animal and vegetable," with a running discourse as to their habits and method of reproduction. His evening with the lantern, when he gave us an exhibition of a large number of diatoms from negatives prepared by himself, was one we look back to with pleasure and satisfaction. The results of his close application to the science of "photomicrography"—for it has become more than an art—makes it possible to understand still more of nature's unseen wonders.

It gives us great pleasure to note the presence at many of our meetings of our old-time co-worker and fellow-member, Dr. Harkness. The *homo Nevadaensis* and Academy of Sciences had so occupied his time for a season, that he found it impossible to give the microscopic matters that naturally came before us the attention that they deserved; he was willing, and we were desirous he should devote to them and us. He has not only been with us several evenings, but twice he has given us lectures on the topics previously announced. That on "Galls and Gall Flies" abounded in much information, and his collection of the various specimens he exhibited in the course of the lecture was very interesting in connection with the address. At a later day he addressed us on the subject of a "New Protococcus and other Minute Algae," which led him into the realms of the germ theory of malarial diseases.

Receptions.

We have not held our usual annual reception, the last time we came before the public being at the Harmon Seminary in October, 1882. We should not allow another year to pass without this annual gathering of our friends being permitted. They look forward to the occasion with interest, and we have only to be troubled as to whom we can omit from our list of invitations. The information so pleasantly gained is never forgotten, and such semi-public gatherings coupled with the excellent reports and epitome of our meetings furnished the newspapers by our efficient Secretary, Mr. Wickson, does more in the general diffusion of such scientific knowledge as properly comes under the microscope than all the exhaustive monographs and treatises which are printed and carefully placed in book stores and libraries.

The Future.

After the business of this annual meeting is concluded, let us each determine to do more in the coming months than ever before. We are banded together not for fraternal or charitable purposes, but to aid each other by an interchange of information. It is intercourse of ideas, friction of thought, which will brighten each other's perceptions, and let every one in this little scientific body do his best in the position assigned him by nature or inclination. Let those of us who love the rocks and the plants and animal life make a close study of all the phenomena evinced by nature in their life and death, their growth and reproduction, and give us the fruits of the investigation. We have a broad field, a rich field, and the workers are few. More hours taken from business cares and devoted to the study of the things about us will surely lengthen our days, enrich our minds, and cause our memory to live a year and a day longer.

Very respectfully,

C. MASON KINNE, President.

Election of Officers.

The election of officers for the ensuing year resulted as follows: President, C. Mason Kinne; Vice-President, S. M. Mouser; Recording Secretary, E. J. Wickson; Corresponding Secretary, C. W. Banks; Treasurer, A. M. Hickox.

SOME of the snowbanks on the Central Pacific have been blown up with powder.

Screw and Bolt Cutters.

Mechanical closeness and perfection in workmanship in screw-cutting tools have been demonstrated by Sir Joseph Whitworth, in England, who has, perhaps, advanced this art more than any living person. Take his surface plates, clean and dry, place them one upon the other, and the upper one will appear to float on a thin

on top and bottom, leaving three-quarters. Whitworth's is a sixth, leaving two-thirds of pitch line. The necessity for a general uniform standard is so generally conceded, the National Machinery Co., in constructing their bolt cutter dies, have given this subject considerable attention. The position to place the cutter in has been carefully studied out, and their machines are constructed with great care.

The main feature of a bolt cutter undoubtedly

NATIONAL BOLT CUTTER.

stratum of air. Expel this and you can raise the lower plate by lifting on the upper one. His standard ganges, when left together a short time, lose this air cushion, and have to be driven out. This same scientific mechanic has given great attention to screw threads, and we owe

is the head or die chuck. The National head or lathe vice has to recommend it strength, rapidity in charging dies, solidity of dies, ease in stripping or taking apart, adaptability to different kinds of machines, and adaptability in connection with the lathe vice to lathes, giving

NATIONAL HEAD AND LATHE VISE.

the scientific system of the present day principally to him. He demonstrated that the angle of 55 degrees was the strongest, and the round top and bottom the best form of thread, and it has consequently been adopted by the English government and people, and by many others elsewhere.

In consequence of the difficulty of any ordinary machinist finding this angle, and the

small machinists a cheap and handy bolt cutter. One of the engravings on this page shows a section of the National head. It is the only moveable, adjustable case die head in the market, this feature being patented. The cutters in the case die are plain pieces of steel, cut off on the anvil and placed in the case ready for hobbing, and capable of being well worn out, as there is an adjustable screw on the back of the case.

One of the engravings represents also the No. 3 National bolt cutter, specially adapted for machine shops, railroad shops, etc. It will cut from $\frac{3}{8}$ to $1\frac{1}{2}$ inches. Different sizes of these cutters are made which will cut from three-sixteenths to four inches. This No. 3 weighs, with countershaft, 1,300 pounds. Messrs. Parke & Lacy, of this city, are agents for this coast for these tools.

A NEW PROTOCOCCUS.—At a recent meeting of the Microscopical Society, Dr. H. W. Harkness, honorary member, addressed the society concerning his recent achievements in scientific discovery and classification. He exhibited specimens of four new genera and thirty species of fungi—some parasitic on the eucalyptus tree. He also gave a full description and exhibited specimens of a new protococcus. This species was found by him in the Fresno big tree grove attached to the decaying trunk of a *sequoia gigantea*. This is much larger than any other species of its genus, is ruby red in color, and is invested with a byaline vitreous envelope. The Doctor exhibited not only the perfect plant, but also the different stages of its growth, and the display was examined with much interest.

Our Home Industries.

Meeting of the Manufacturers' Association.

A general meeting of the Manufacturers' Association of California was held at the Patent room of the Mechanics' Institute on Thursday, the 21st inst., President A. S. Hallidie in the chair. Among those present were I. Hecht, of Buckingham & Hecht; Mr. Larkin, of Larkin & Co.; P. Duodon, boiler maker; F. C. Clark; Byron Jackson, of the Agricultural Works; Mr. Schmidt, of the Schmidt Lithograph and Label Co.; J. H. Small, machinist; A. Haraszthy and H. Epstein, of Haraszthy & Co.; John Roach, instrument maker; S. P. Taylor, paper manufacturer; H. Phelps and W. S. Phelps, of Phelps Bros.; Mr. Peckham, of the San Jose Woolen Mills; Mr. Starbird, of Starbird & Goldstein; Abner Doblo, iron and steel; James Spiers, Fulton Iron Works; H. L. Davis and A. S. Hallidie, of California Wire Works; W. T. Garratt, brass foundry; Wm. Harney, of Golden Gate Woolen Mills; E. G. Denniston, San Francisco Electro-plating Works; Mr. Evans, of Thompson & Evans; Lewis H. Sharp, attorney for the Board of Directors; W. H. Holmes, carriage manufacturer; L. B. Benchley, of Pacific Rolling Mills; R. H. Savage and R. Savage, of Empire Foundry; Mr. Campbell, of California Bellows Manufacturing Co.; S. M. Smith, of Cutting Packing Co.

The first business considered was an amendment to the by-laws offered by Mr. Harney at the Directors' meeting of Jan. 11th, being an amendment to Section 13. The old section was stricken out and the following substituted: "All persons or firms engaged in the manufacturing business within the State of California are eligible to become members of this association."

The reason of the adoption of this is that it was found that many manufacturers have to import some articles necessary for their work. Under the old rule many manufacturing firms, such as Holbrook, Merrill & Co. and J. C. Johnson & Co., were shut out from the association because of they also imported either raw material or some manufactured goods. The new rule widens the field of membership materially.

The Executive Committee made a report on the subject of coast defenses previously referred to them, and presented the following memorial to Congress, which was adopted, and the Secretary directed to forward it duly signed:

MANUFACTURERS' ASSOCIATION OF THE
STATE OF CALIFORNIA.
SAN FRANCISCO, February 21, 1884.

To the Honorable Senate and House of Representatives in Congress assembled:

WHEREAS, Our navy and fortifications are inadequate for the protection of the Pacific and Atlantic coasts, and would be almost useless against the aggression of a foreign foe, with a coast line of thousands of miles bordering on both oceans, everywhere exposed to the attack of a naval force; with fortifications armed only with smooth-bore guns; with prosperous and growing cities utterly defenseless against any power possessed of a few first-class, modern war vessels, this country has for years done nothing comparatively for the national defense afloat; it would, therefore, result that in the event of a maritime war, the same would be at the mercy of the enemy.

WHEREAS, The Chamber of Commerce of San Francisco has memorialized Congress, urging the prompt increase of the United States Navy, by the addition thereto of modern ships armed with effective ordinance. Like sentiments are set forth in the report of the First Advisory Board of November 7, 1881, composed of officers of the United States Navy, of recognized ability.

WHEREAS, The said memorial of the Chamber of Commerce, together with the said report of the First Advisory Board, fully expresses the views of the Manufacturers' Association of the State of California. Therefore, be it

Resolved, That the Manufacturers' Association of the State of California, at its general meeting, held in the city of San Francisco, this 21st day of February, 1884, fully indorses the said memorial of the Chamber of Commerce and the recommendations set forth in said report of the First Advisory Board on said matters, and hereby instructs the Board of Directors of this association to forward to Congress, through the California delegation, copies of the same, with an energetic approval of the policy therein advocated, and urge our Representatives in Congress to do what they can to further the construction of vessels and improvement of fortifications for the protection of our coasts.

President A. S. Hallidie read an address, which is appended to this report.

At the conclusion of the address the President invited the gentlemen present to express their views upon the subjects most vital to the Association. In response to this Mr. Sidney M. Smith offered some very pertinent and useful suggestions, which were attentively listened to. Mr. Smith is President of the Cutting Packing Co., and he spoke of the lack of practical encouragement given to our local manufacturers, and the lack of local pride in our home products. A woolen manufacturer had told him that in order to dispose of his cloths his company had been obliged to put a foreign mark on them. Another drawback was that men of mediocre means starting in business had not the favor of the banks extended to them.

Mr. Harney did not entirely agree with Mr. Smith on the latter proposition.

Judge Peckham, of the San Jose Woolen Mills, made a few remarks. Col. R. H. Savage, the foundryman, then made some remarks on the serious question of employment and labor of subordinates, and the methods of effecting

(CONTINUED ON PAGE 160.)

Reissue Patents.

The United States Circuit Court on Powder Patents.

Judge Lorenzo Sawyer, of the United States Circuit Court, has rendered the following oral opinion in the case of the Giant Powder Company vs. the Safety Nitro Powder Company:

In the case of the Giant Powder Company vs. the Safety Nitro Powder Company, a motion for leave to file an amended plea, setting up several distinct defences, has been argued in connection with the argument as to the sufficiency of the plea already filed. The Giant Powder Company was the owner of the original patent, number 78,317. This patent was surrendered and reissued as patent 5,619. Afterwards, for the purpose of correcting a clerical error, patent number 5,619 was surrendered and reissued as patent number 5,799. A suit upon this last patent was decided by Mr. Justice Field in this court, in which it was held that the reissue was broader in its scope than the original invention, as described in the patent, the original patent, number 78,317, being for a combination of nitroglycerine with some non-explosive absorbent material, while the reissue embraced explosive as well as in explosive absorbents; and Mr. Justice Field held that in that particular the reissue was broader than the original patented invention, and for that reason void. (Giant Powder Co. vs. Cal. Vigorite P. Co., 6 Sawyer, 509.) This being so, patent 5,799 was surrendered and reissued again in patent number 10,267; and in patent number 10,267 both the specification and the claim are identical with those of the original patent number 78,317, which had before been surrendered and reissued in the patents heretofore mentioned.

These facts are set up in the plea, and it is claimed that patent No. 10,267 is void, it being identical with the original surrendered patent number 78,317. That patent was surrendered as being inoperative, and, as a reissue can only be had where the patent is inoperative, it is claimed that the original patent must have been held to be wholly inoperative. I think counsel are mistaken in the proposition.

A Patent may be Inoperative.

In my judgment, when it is inoperative in part, I do not think it must be absolutely inoperative in its entirety. If it is inoperative so far as not to cover all that the party is entitled to claim, and what he is entitled to claim appears in the specification, it being inoperative to that extent, I think it would be inoperative within the meaning of the provisions of the statute, and entitle the party to a reissue. It does not necessarily follow that patent number 78,317 was wholly inoperative, or void, or useless. I am not aware that it has ever been held to be utterly invalid in all its parts.

The question of fraud in procuring the reissue in my opinion does not arise on this plea, because the question as to whether a mistake has been innocently made in not covering by the patent all that the party was entitled to cover, the question whether there is a fraud in the surrender and application for a reissue is for the officers of the patent office alone to decide, and their determination is conclusive in a collateral proceeding. This court can only examine and pass upon what appears upon the face of the patent, and see whether there is anything to indicate its invalidity, or render it void upon its face. All questions of fact behind the patent are to be examined, heard and conclusively determined by the Commissioner of Patents. This principle has been affirmed over and over again by the Supreme Court.

I do not think the fact that the patent was reissued in the identical

Terms of the Original Patent

Number 78,317, renders it void. The specifications of the patent last surrendered were amended by omitting the objectionable parts. Patents are constantly reissued for portions of the specifications and claims in the identical language of the original patent. Each claim in its nature substantially and in effect covers a distinct and separate invention and is an independent patent in substance and effect. It might be the subject of an independent patent; and if in any reissue, so far as the patents are identical, those claims are valid in the reissued patent having another or additional valid claim, or a modified claim, or some other change in the specifications. I do not perceive why they would not be valid in a patent limited to them alone. If they can all stand together, I do not see why a reissued patent, covering the identical claims by themselves, may not stand and be valid.

Patents may be Reissued in Divisions.

It is not necessary that all claims in the reissue should be included in one patent. They are often issued in divisions, and I suppose that a patent might be reissued in divisions in the identical language as to some of the claims, the changes being included in another and separate division or patent; that is to say, all claims or inventions which are fully covered and operative, may be reissued by themselves in one division in the identical language of the original surrendered patent; and all other claims or the amendments to the specifications, and covering the invention shown by the amended specifications in another division or patent. I do not see why a part of the original claims may not be reissued in one division in

identically the same language as in the original patent and the rest in another. If this can be done without affecting the validity of the reissues, and a party finds that he has made a mistake and surrendered a valid patent and obtained a void reissue, I do not perceive why he may not fall back upon his old patent and have it reissued on a newly-amended specification embracing that portion which is valid. If parts which are identical are valid in connection with other parts in a reissue, I do not perceive why they should not be valid in a reissue containing no additional matter.

Now, in this particular class of cases it is quite extensively claimed by the bar, I think, that the Supreme and some of the Circuit courts have made something of a departure in some of their

Late Decisions Upon Reissues.

Including the reissue in question. Mr. Justice Field held patent 5,799 to be void, while several of the Circuit Judges at the East held it to be valid. Where courts make a mistake it may very properly be conceded that a party may very well make an honest mistake himself. On the argument of the plea my attention has been called for the first time to the case of Gage vs. Herring, 107 U. S., 646, in which I think the principle involved in the plea is distinctly determined. The court says: "The invalidity of the new claim in the reissue does not, indeed, impair the validity of the original claim, which is repeated and separately stated in the reissue of patent. Under the provisions of the patent act, whenever, through inadvertence, accident or mistake, and without any willful default or intent to defraud or mislead the public, a patentee in his specification has claimed more than that of which he was the original and first inventor or discoverer, his patent is valid for all that part which is truly and justly his own, provided the same is a material and substantial part of the thing patented, and definitely distinguishable from the parts claimed without right; and the patentee, upon reasonably recording in the Patent Office a disclaimer in writing of the parts which he did not invent, or to which he has no valid claim, may maintain a suit upon that part which he is entitled to hold, although in a suit brought before the disclaimer he cannot recover costs. Rev. Stat. Sec. 4,917, 4,922; O'Reilly vs. Morse, 15 Hon., 62, 120, 121; Vance vs. Campbell, above cited. A reissued patent is within the letter and the spirit of these provisions."

The Plea Overruled.

If a reissued patent is within the letter and spirit of these provisions, as stated, and "the invalidity of the new claim in the reissue does not, indeed, impair the validity of the original claim, which is repeated and separately stated in the reissued patent," it is not apparent to my comprehension why a second reissue, embracing the valid claim alone of the original patent, would not be valid. I cannot, therefore, say that the patent number 10,267 is void by reason of anything asserted in the plea, upon the grounds set forth. The plea must, therefore, be overruled.

With reference to the filing of the proposed so-called amended plea, I think it is not within the reasonable discretion of the court to allow it to be filed at this late day. In view of the circumstances of this case, as they appeared before this court in the various stages of the proceedings, I think it would be an abuse of its discretion to allow the plea to be filed if it were otherwise a proper plea. In fact, the proposed amended plea sets up all the defences that can be made to a patent, and it would involve the trial of the whole case with the exception of the single question of infringement.

The object of a plea, where there is some certain single issue, requiring but little evidence, that will dispose of the whole case if sustained, is to try that issue without putting the parties to the expense of the trial of the case at large, and pleas are limited to a single defence or issue, unless by permission of the court the defendants are allowed to plead double. If the court allows this so-called amended plea to be filed, it would allow parties to try all the issues in the case with the exception of the one issue as to infringement, and it would be necessary to try the whole case on the merits by piecemeal. Besides, it comes too late.

Leave to File Denied.

After this plea was originally filed it was stipulation that it stand for an answer, so far as it was available as a defence. An answer and replications were filed, and the parties commenced taking testimony. In the course of taking the testimony the attorney for the defendant ascertained the importance of having the case decided on his plea, provided it was good, and thought he was at a disadvantage in his then position. He therefore moved upon affidavits to be relieved from the stipulation, taking the plea for an answer. He claimed, among other things, to have misunderstood the practice of the court. After argument, the court, thinking there might be something in the plea, as this exact point had never been decided, so far as it was aware, and, if good, it would save the expense of a trial, relieved the party from the stipulation and allowed the plea to be set down for argument. I did not think the exact question had ever been presented before, and when the argument was made upon the stipulation I had not seen the case of Gage vs. Herring supra which I think decides the principle. I thought there was, perhaps, something in the plea. At all events I thought it was worthy of being carefully considered, for

if the plea is good and the patent absolutely void upon its face, I saw no occasion for putting the parties to a great expense of going to a trial of all the issues in the case. I, therefore, set aside the stipulation, and allowed the defendant to withdraw its answer in the case and set the plea down for a hearing. It was set down for a hearing, and continued from time to time, until finally it came up for argument, counsel from Philadelphia coming out to argue the case on the validity of the plea. When the plea was called for argument, it was found that there had been a change of attorneys, and an application was made by the substituted attorney at the moment for leave to file the proposed so-called amended plea, which presents all the issues in the case, with the exception of the one issue of infringement. I think, under the circumstances, it would be improper, and would be an abuse of discretion to allow this so-called amended plea to be filed at this late day.

Leave to file the proposed amended plea is therefore denied.

Building Stone on the Pacific Coast.

Stone suitable for building and similar uses is abundant in all the Pacific States and Territories. Besides mountains of granite and immense beds of sandstone, there occurs in many parts of the country a species of steatite well adapted for building purposes, being light, fireproof, very durable, and easily quarried and dressed. Much use is made of this stone in the localities in which it abounds, more especially in sections of the distant interior where lumber is scarce. Neither stone nor brick is much employed for building in these Western regions, lumber being almost everywhere cheap, and climate and convenience favoring its extensive use. Even in the large cities more than three-fourths of the structures of every kind consist of wood; many of them, however, have brick or stone foundations.

Granite.

Large quantities of granite are used in San Francisco, and some of the other large towns, for curbing the sidewalks and street crossings. This stone is extensively quarried at Folsom and Natoma, in Placer county, California, and at Rocklin and Penryn, situated on the Central Pacific railroad, 22 and 28 miles, respectively, from the city of Sacramento. The granite at these places is of excellent quality, that obtained at Rocklin and Penryn being considered especially good. As the deposits here are very extensive and the rock splits evenly, it is possible to break out blocks of large dimensions, some more than 100 feet long, 50 feet wide, and 10 thick having been quarried out and afterwards broken up into smaller pieces.

The Penryn granite works are some 28 miles east from Sacramento, on the line of the Central Pacific railroad. The first of the several quarries from which the stone is procured was opened in 1864 by the present owner, Mr. G. Griffith, whose establishment is the most complete on the coast. His quarries cover some 650 acres at Penryn and Rocklin, the latter point being six or eight miles distant from the former in a due westerly direction. The cutting and polishing works, located near Penryn, and the principal quarries, are extensive. They consist of various buildings and sheds, filled with machinery employed in cutting and polishing the granite. Here 200 men find constant employment, and the force is frequently much greater. The chief superiority and predominating excellence of Penryn granite consist in the fact that it does not change color by exposure, and that it contains no iron. These advantages give to the Penryn granite superiority when used for monuments, tombstones, or when placed in any position where it will be exposed to the elements. The predominating shades of Penryn granite are blue, gray and black, the last named very much resembling the celebrated black granite found in Egypt, and exceedingly beautiful when highly polished.

Granite quarries are worked at a great many other places in California and elsewhere on the coast.

Marble.

Carbonate of lime in nearly all its forms is abundant on the Pacific coast and in the adjacent Territories, especially as limestone. Marbles in great quantity and in every variety are found in California, the following localities being noted for their fine beds.

Near the town of Columbia, Tuolumne county, where the deposit is of great thickness: masses weighing as much as 600 tons have been blasted out, and single blocks weighing 13,000 pounds have been quarried and dressed. For sawing the stone into slabs and other required forms a water-power mill has been put up at the quarry, from which a good deal of marble has since been taken out and sold, the most of it having been used for building purposes in San Francisco. In color this marble is much diversified, some portions being an unclouded white, while others are tinted with a blue or gray, or a blending of hues of many kinds. It is all fine-grained and extremely hard.

Four miles from the town of Snism, Solano county, where the stone in its rough state has exactly the appearance of rosin, it occurs in heavy beds, blocks measuring 800 or 900 cubic feet having been broken out here. A great deal of marble has been taken from this quarry, the unique tints of the material and its fine grain recommending it for many ornamental uses.

On the McCloud river, near Copper City,

Shasta county, a pure white marble is found, fit for all kinds of delicate work, even for statuary. Being in a remote and sparsely settled region, not much has been done with this bed, though it is said to be very extensive.

At Indian Diggings, El Dorado county; above Downieville, in Sierra county; at Susanville, in Lassen county; and in Placer county near the line of the Central Pacific railroad, occur heavy beds of marble of almost every degree of color and fineness, though none of them have been extensively worked. The deposit at Indian Diggings, opened in 1857, the first ever worked in the State, is of the clouded variety, and has been much employed for monuments and like purposes. In this bed, which is over 100 feet thick, there occurs a grotto nearly 700 feet long and from 20 to 80 feet high.

While there has always been a great demand for marble in California, only the more common kinds obtained from the quarries opened in the State have been largely used, the finer varieties having been imported from Italy. Much of the stone in California is of excellent quality, being a pure white or beautifully variegated, susceptible of the highest polish. It is probable that none equal to the Carrara has yet been met with in the State, but from the quality of some already found near the surface, it is thought that marble equal to the best foreign will be obtained when the deposits come to be worked to greater depths. In addition to the kinds already mentioned, there are handsome specimens of the Cipolin, white with shadings and streaks of green, and the Porton or Genesee yellow; also, what is termed Ruin marble, a yellowish stone with broken brownish lines resembling the ruins of fortifications, castles and other artificial structures.

What has tended to prevent the larger use of the domestic product has been the cost of transportation, which from almost any of the quarries to San Francisco has been greater than from Italy to that point. Through the construction of railroads into the interior the transportation of marble is likely to soon be so cheapened that the principal supply will thereafter be obtained from home sources.

It does not appear that much, if any, marble has as yet been found in the State of Nevada, nor is this stone so abundant in any other part of the Pacific coast as in California. Enough of the carbonate of lime occurs everywhere, however, in other forms to make all the lime required for local purposes, Oregon alone forming an exception.

Sandstone.

A handsome fine-grained sandstone of a greenish gray color is quarried on Angel island in the bay of San Francisco. A brown sandstone obtained near Haywood's, Alameda county, California, is much used in the cemeteries as bases for monuments, constructing vaults, etc. A bed of sandstone of a pinkish color, streaked with wavy lines of brown and purple, occurs near the Merced river, in Mariposa county, which, being very beautiful and durable, would be likely to come into large use were the locality more accessible.

Slate.

While slate is very common stone on the Pacific coast, the fissile variety suitable for roofing has been found only in a few localities; one of these being near Copperopolis, Calaveras county, California, where a stone of a very good quality is found in abundance. A bed of similar slate was opened over 20 years ago in Amador county, California, and worked for a short time, when the enterprise was abandoned, there being little demand for it when gotten out, asphaltum, tin and shingles continuing as before to be preferred for roofing purposes.

"Trachyte."

In various parts of the western mining region an igneous rock, generally known as "trachyte," is found. It is usually of a pinkish-gray color, and affords convenient and most desirable stone for building purposes, being soft when first taken from the quarry, but gradually indurating on exposure to the atmosphere. This hardening property, however, is sometimes claimed on slight grounds. The stone is durable and resists a high degree of heat.

A FLOATING FIELD OF PUMICE STONE.—The steamship *Bohndell Castle*, which arrived today from London, reports having passed through an immense field of pumice stone extending from latitude 8° south and longitude 80° east to latitude 16° and longitude 100° east. The pumice stone varied in color from grey to dark red, and there was for a long time no getting away from it. Its appearance is supposed to be attributable to the recent volcanic disturbances in the Indian Archipelago.—*South Australian Observer*, 29th Dec., 1883.

USE OF LOW STEEL.—Builders of machinery and machine tools are rapidly substituting low steel for refined iron in the parts of machines subjected to strain, and yet requiring stiffness. Low steel is extensively used in drop forging, and for many objects is preferred to Norway or Swedish iron. It will bear as soft heating, leaves cleaner lines, and is superior in stiffness, although it is exceedingly tough and fibrous.

ONE PATENT WORTH \$25,000,000.—The value of the telephone patent is enormous, and we very much doubt if it could now be purchased for \$25,000,000. It is probably by far the most valuable single patent which has ever been issued.—*Electrician*.

A Notable Literary Workshop.

Dictionary Making Letters of Prominent Men Valuable Autographs.

The work of compiling the editions of Webster's Unabridged Dictionary goes on quietly from year to year, as it has gone on for years before. The last edition of this work was brought out in 1879, and, as in the past, editions have been brought out only once in twenty years; it will be a number of years yet before another edition of this voluminous work will be given to the public. And thus our city rules the world in one respect, for from her as a center emanates in every direction the decrees which govern good English the world over. We who live in the city never stop to think what a notable interest we foster till some stranger comes to town, who, instead of asking us to direct him to the United States armory, or some other well-known point of interest, asks first: "Where do they make dictionaries?" One of the members of the firm which has the work in hand went through the letter book of prominent men, and showed a reporter at some length the

Autograph Letters

Of many notable persons, some of whom have already passed into history. Probably no business firm in the country possesses an equally valuable and choice collection; and, to a person interested in such matters and in studying the characters of some of the men who penned them, they form a most interesting subject and study. Letters from Governors, College Presidents and that ilk are common enough. A letter and envelope, each bordered with the deepest of mourning, from the President's office, signifies the time when it was sent, and the deep mourning into which the nation was thrown two years ago at this time. A letter from the young King of Siam, Chulalongkorn, dated at the Grand Palace, Bangkok, and written by his Private Secretary, states that he shall always keep the invaluable book upon his desk. The Secretary has a sweet little name, by the way. It is Dwanudaywongse, and he omitted to state what the King called him for short. The letter was quite finely worded and penned. The elephantine proportions of David Davis would not for a moment be suspected from his letter; while Ralph Waldo Emerson wrote a charming little letter, so neat and modest, on note paper of delicate size, the whole so characteristic of the man. Letters from Longfellow and Whittier, Holmes, Howells, James T. Fields, Bancroft, the historian, Rutherford B. Hayes, Evans and Viceroy Said, of Egypt, are only a few of the more notable ones. The firm is also in receipt of a large number of

Curious and Amusing.

And in some cases cranky letters, from individuals all over the world. A Burlington (N. J.) Quaker has a very characteristic way of writing his postal cards. Before and after the date he places Scripture references, and follows with a short sermon, and the hope that "we may be kept from rum, tobacco, opium, tea, coffee, drugs, salt, pepper, lard and all condiments, and swine's meat, theaters, etc." He then proceeds to drive as sharp a bargain as his conscience will allow. A western editor wrote that "he might just as well try to keep house without a wife, as to run a paper without a Webster's Dictionary." Another South African trader wanted to trade monkey skins and oil for Webster's Unabridged, and thought he could do quite a business. The advertisement during the winter of Webster's Unabridged as a holiday gift seems to have sadly misled some unsophisticated mortals, with a faith that is really childlike, and one of them writes: "Will you please send me your holiday gift, Webster's Unabridged Dictionary, for my birthday?" Another one wrote that he "had seen their advertisement of a holiday gift of Webster's Unabridged, and if they sent it to any one he hoped they would remember him." In a little cabinet is the original manuscript—the copy sheets returned from the hands of the printers with the handwriting of the various scholars who have contributed to the perfection of the work—Dr. Mahn, of Berlin, the author of its etymologies, of specialists who have suggested the definitions of technical words, and of the editors who have revised and boiled down both. The dictionary was first published by Dr. Noah Webster, in 1828.—*Springfield (Mass.) Union.*

A BONANZA OF SNOW.—Mount Davidson is now a grand bonanza of snow. This snow the winds, waltzing about the top of the mountains, pick up and shower down on the just and unjust alike. At times this snow is hurled down into the town by shovels. Though the snow down in the city is moist, that on the mountain is still dry and frozen. With a gale blowing, though the sky be cloudless, the snow often comes down over the town faster than when the heavens are overcast and every cloud is snowing its best.—*Virginia Enterprise.*

COEUR D'ALENE GOLD.—All the gold found at Coeur d'Alene is coarse and unworn, with few particles of quartz attached, and seemingly but little water-washed. Most of it has been found in crevices and between the layers of the rim of the bedrock, known as rim-rock. The bedrock is of the hardest kind, commonly known as a kind of slate. It is very rough, full of seams, in layers of an angle of about 45 degrees. At the middle of the creeks it is from one to five feet to bed-rock.—*Idaho World.*

USEFUL INFORMATION.

Tempering Glass.

A recent work, *Le Verre et le Cristal*, by M. J. Henrivaux, Assistant Director to the glass factories of Saint Gobain, Paris, is full of facts as interesting to the general reader as to the specialists. This is what it tells us of tempering glass:

The operation of tempering consists in immersing the glass when heated to redness, in a bath of a given temperature. At Choisy-le-Roi this branch of the industry is carried on to a very large extent, and the experience obtained there indicates the following details of practice: Water is entirely unsuitable for this purpose, and only perfectly pure grease or oils give a good result. A mixture of three fourths of linseed oil and one-fourth grease is very satisfactory, but it must contain no impurities, and improves in quality with age and use. The temperature required ranges between 150 degrees and 300 degrees Cent.; glycerine is also well adapted for the purpose. The oil is kept at the required temperature in cylindrical iron vessels, which can be moved conveniently, and the objects are placed in light iron wire baskets immersed in the oil. After being brought to the required heat and plunged in the bath, the latter and its contents are removed on suitable trucks to a cooling room, where after four or five hours the temperature falls to about 40 degrees. The glass objects are then removed, and kept in a stove at a temperature of 70 degrees Cent. for about two hours, by which time all the oil clinging to them has run off. They are then immersed successively in a bath of water saturated with caustic soda, and heated to 60 degrees, in a bath of water at 50 degrees, and lastly in another water bath of air temperature. The actual cost of tempering appears to be .025 franc for drizzling glasses; .030 franc for glass chimneys; .050 franc for lamp globes. Careful experiments have been made on the increased resistance to strain of glass that has been tempered. Briefly, these experiments show that the elasticity of tempered is double that of ordinary glass; that its resistance to fracture under a load is 2.5 times greater, and for doubly tempered glass 3.10 times. Polished tempered glass is 3.57 times, and rough glass 5.33 times stronger than the corresponding glass untempered. M. Henrivaux points out that the changes produced by tempering are purely physical. The operation changes the molecular structure of the glass, it becomes less dense, and the broken fragments have no sharp angles.

PRESERVING HARNESS.—The first point to be observed is to keep the leather soft and pliable. This can be done only by keeping it well charged with oil and grease. Water is a destroyer of each of these, but mud and saline moisture from the animal are even more destructive. Mud in drying absorbs the grease and opens the pores of the leather, making it ready prey to water, while the salty character of the perspiration from the animals injures the leather, stitching the mounting. It therefore follows that to preserve a harness the straps should be washed and oiled at intervals as required. To do this effectually, the straps should be unbuckled and detached, then wash with warm soft water and brown soap, and hang by a slow fire, or in the sun, until nearly dry, then coated with a mixture of meat's-foot-oil and tallow and allowed to remain in a warm room for several hours, and when perfectly dry rub thoroughly with a woolen rag. The rubbing is important, as it, in addition to removing the surplus oil and grease, tends to close pores and give a finish to the leather. In hanging harness care should be taken to allow all the straps to hang their full length. Light is essential to the care of leather, and when the harness closet is dark the door should be left open at least half the time during the day. All closets should be well lighted. To clean plated mountings, use a chamois with a little tripoli or rotten stone; but they should be scoured as little as possible.—*Harness Journal.*

A NEW FIRE EXTINGUISHER.—At a recent test of the hand-grenade fire extinguisher, a wooden box about seven feet high was set up in an open lot, and after being thoroughly saturated with tar and kerosene oil was set on fire. When the box was all aflame and the boards burned about half through, the exhibitor threw two of the grenades into the box. The flames instantly ceased and every vestige of fire, even to the smallest coal disappeared when two more were broken, the whole experiment using four grenades, costing at the price charged for them about \$2. The grenades are glass bottles holding about a pint, or half-pint, of liquid, and when broken they give off a gas in which it is chemically impossible for combustion to take place. They are designed, more particularly, for use in dwellings, factories, and on ship-board, where any small fires may be instantly extinguished without calling on the fire department. The fluid is perfectly harmless to the clothing, the hands, or in fact anything with which it comes in contact.

CANNONS OF SILK AND STEEL.—The "leather" guns of old—barrels of leather, bound with iron hoops—are to find an imitation in cannons of silk and steel. A German inventor proposes to

wrap a steel tube with silk until a diameter is attained corresponding with the ballistic power which is required for the cannon. For any given diameter, silk possesses a tenacity as great as that of the best tempered steel, and has the advantage of a superior elasticity. After the tube has been made, it is centered upon a lathe which turns with a great angular velocity. Above and parallel with the tube are arranged a number of spools of silk, which cover the surface in the form of a helix, by means of guides, without leaving any space between the threads. When the desired thickness has been obtained, the silk is coated with gutta-percha or hardened caoutchouc, in order to preserve it from air and dampness. The silk being a bad conductor of heat, the gun can be fired very often without getting hot, and it is stated that it can be more easily managed, since its weight is only one-third as great as if it were all of steel.

VEGETABLE SILK.—A German technical journal gives some details as to a vegetable substance, somewhat resembling silk, to which attention has lately been drawn by its having been exhibited in Greece. It is stated that this substance is a silky-haired portion of a tree-like shrub, which came originally from America, but is found in Syria and the south of Europe (*Asclepias Syriac*), of the family of Asclepiades. It is also known as the Syrian silk plant. The substance in question is used for stuffing very soft cushions. When mixed with silk and wool the Syrian silk is said to be used in different tissues. The milky juice of the plant is poisonous, and the tough stalks can be used in the same manner as the corresponding portions of the hemp plant. An English exchange, which has seen a specimen of this fiber, says: "It is certainly very beautiful, soft to the touch, and very silky in appearance. Whether it is likely to be used largely for manufactures is quite another matter, upon which no off-hand opinion would be worth much."

TO MEASURE FOR BELTING.—To find the length and course of a belt, apply a tape-line or string to the pulleys where the belt goes, and then measure the length of the string by a two-foot rule, which a mechanic should always have at hand; and when such measure cannot be made, make a drawing, full size or to scale, and step dividers around the course of the belt. By means of such drawings, the places where the belt passes floors and the like can also be found. These methods are more trustworthy and more convenient than any system of calculations, however tabulated, formulated, or prepared.—*Copper on Belting.*

ARTIFICIAL MARBLE.—A process of producing artificial marble and rendering it fire proof and water-proof has been patented by Mr. Richard Guelton, of Brighton, Eng. The fabrication is made by means of cements, gypsum, or alum, applied to polished surfaces or placed in moulds, fibres being applied to the surfaces to form the veins. An enamel is obtained by laying on one or more coats of varnish, exposing the article to heat after each coat, and by polishing the varnished surface with pumice stone and finally with tripoli.

GOOD HEALTH.

Photography in Hospitals.

Most of the French hospitals have now a photographic studio attached for photographing the sick persons at different times. The rapid dry-plate process is employed, and Professor Charcot, of the Salpêtrière, has devised an electrically operated camera which is very useful in taking a series of views in rapid succession. Certain classes of patients are photographed on their entry into the hospital and at regular intervals after. In cases of hysteria, for example, it is interesting to note the original contractions and compare them with succeeding ones. The photographs are placed in an album for study of the disease, and for comparison with others taken from other patients. In this way the leading features of the disease will be recognized. The new printing processes also enable these photographs to be copied and distributed to other hospitals and medical men.

Micro-photography, or the photographing of microscopic objects, is also a valuable branch of hospital work, which is becoming better recognized every day. The apparatus of Professor Charcot consists of a camera with a movable aluminum shutter controlled by an electromagnet and clock-work. A key and battery sends an electric current through the magnet at the will of the operator and, working the shutter, exposes an objective to the object. The photographer controls the apparatus by hand, and with his finger on the key, watches the patient until the desired moment arrives, then he presses his finger and exposes the plate for the instant required to take the likeness. When a regular series of views in rapid succession are required, the hand key is replaced by an insulating barrel set round with metal contact pieces, like a commutator, and these pieces make contact with a contact spring as the barrel revolves by clock-work. These metallic pieces are made of a triangular form, so that when a short exposure is required the spring is

placed so as to rub over them towards their apices, and when a longer exposure is required it is caused to rub over them near the bases. The metronome, or automatic mercury current interrupter of M. Gaide, is also applicable to this camera as an automatic key. *London Engineering.*

COPPER IN THE SYSTEM.—MM. Houles and Pietra-Santa, who have studied the matter in the copper-working districts of France, recently made a communication to the French Academy of Sciences, on the action of metallic copper on the human system when breathed in the form of dust in the foundries. They state that in a workshop where yellow copper in great quantities is turned and the air is thick with copper dust, the workmen experience no ill effects from breathing the latter, though the same dust mixed with food sometimes gives rise to slight gastro-intestinal trouble and general malaise. At Tarn (Durfort), a colony of copper-workers, living twelve hours a day in an atmosphere impregnated with copper oxide and iron oxide, or red copper dust, do not suffer from it. There appears to be no special malady due to copper inhalation; and on the other hand, any immunity from typhoid fever or cholera has not been observed, though the people are in some instances yellow in the skin and eyes with copper taken into the system.

MEDICAL VALUE OF LEMONS.—Most people know the benefit of lemonade before breakfast, but few know that it is more than doubled by taking another at night also. The way to get the better of the bilious system without blue pills or quinine is to take the juice of one, two or three lemons, as appetite carves, in as much ice water as makes it pleasant to drink without sugar, before going to bed. In the morning, on rising, at least half an hour before breakfast, take the juice of one lemon in a goblet of water. This will clear the system of humor and bile with efficiency, without any of the weakening effect of calomel or congress water. People should not irritate the stomach by eating lemons clear, the powerful acid of the juice, which is always most corrosive, invariably produces inflammation after awhile; but properly diluted so that it does not burn or draw the throat, it does its medical work without harm, and when the stomach is clear of food, has abundant opportunity to work over the system thoroughly.—*Medical Journal.*

CREMATION IN AMERICA.—The President of the United States Cremation Society says that there are 5,000 persons in this country pledged to have their bodies burned. There is as yet only one crematory, that at Washington, Pa., but plans are drawn for another, and the Society is raising the money to build it. Fifteen thousand dollars have been subscribed. The building will, besides the furnace, contain a room for the resuscitation of persons who would otherwise be burned or buried alive; another for the keeping of bodies by refrigeration until the arrival of distant mourners, who might wish to take part in funeral ceremonies, and a third in which any desired rite may be held.—*N. Y. Sun.*

HOW TO TREAT A SPRAIN.—The treatment should be applied immediately after the accident occurs, or as soon thereafter as possible—the sooner the better. The neglect of this precaution has frequently resulted in the loss of the use of a limb for months or years. If taken in hand promptly, nothing is easier than the cure of a simple sprain. Hot water is a panacea for sprains and bruises. The limb is to be placed in the water as hot as can be borne for a quarter of an hour, when the pain will have gradually disappeared.

CORSETS FOR GIRLS.—At the recent Sanitary Exhibition in England there was exhibited an unusually large number of corsets for young girls. The London *Sanitary Record*, in commenting on this, remarks that "no straight, healthy, well formed girl should ever wear one of these articles. If older persons see fit to do so in later life they may, but to put them on to the growing girls can be called by no other name than a crime." This is forcible and true, and yet how many mothers will heed it?

REMOVAL OF FRECKLES.—The careful application of a small piece of the ointment of the oleate of copper at night upon retiring will usually remove the freckles. The oleate of copper ointment should be prepared by dissolving one drachm of the salt of oleate of copper in sufficient oleo palmitic acid to make a soft ointment.—*Shoemaker.*

SHORT DRESSES FOR CHILDREN.—One of the New York school teachers writes that the very short dresses which little girls wear causes more sickness than all the badly plumbed school-houses in the city. The society with a long name should attend to its business.

THE PHYSICAL CAUSE OF YAWNING.—Yawning is supposed to arise from a reflex action of the nerves, caused by weariness, and is kindred to many other kinds of involuntary motions, that are probably derived from the nerve centers.

SODA FOR BURNS.—The chemical reason why bicarbonate of soda relieves a burn is probably due to the neutralizing action of the alkali on the acid products of decomposition arising from the burn.

Our Home Industries.

(CONTINUED FROM PAGE 157.)

proper and kind relations between employer and employee. His impromptu remarks were practical and philanthropic, extending over fifteen minutes, and were full of valuable suggestions respecting the discipline and duty to be observed by all interested.

Mr. L. B. Benchley, President of the Pacific Rolling Mills, addressed the Association, discussing the several questions which had been mentioned with business like and intelligent ability and experience.

Mr. Arpad Haraszthy then broached the labor question from the view of the farmer and wine-grower. He also made some statements upon the use of California wines under foreign names, and briefly sketched the progress and production of wine in this State, giving the amount produced and exported. His remarks exhibited comprehensive knowledge of this important subject. Mr. Schmidt, the lithographer also made some pertinent remarks.

Col. Richard Savage volunteered some experiences respecting patronage of home manufactures and products.

Mr. Spiers followed with some very proper remarks respecting schooling of boys to trades and the duty of manufacturers and employers in vouching them and seeking to correct the present restriction of trades union, in the restrictive system of trades unions, in regard to apprenticeships, by encouraging technical schools and the manufacture of specialties.

Mr. John Roach, the optical instrument maker, related some humorous incidents of his experiences with the custom house.

Mr. Hallidie then reviewed the condition of manufactures in this State, and the promise afforded by the extending population of the adjacent States and Territories, closing with a deserved tribute the results accomplished for the association by Mr. J. H. Gilmore, the late Secretary.

PRESIDENT HALLIDIE'S ADDRESS.

To the Members of the Manufacturers' Association of California—GENTLEMEN: If California intends to keep abreast of other States of the Union in the race for success she must keep her people industrious. Industry is essential to prosperity and happiness. No nation can have reasonable prosperity and contentment and be idle; idleness begets laziness, laziness sin and crime.

California began her career with great mental and physical activity that was absorbed into the pioneer life of mining and trading. Great desire for wealth spurred her citizens on to great efforts in the direction of its accumulation, and with occasional and vivid instances of success, but the majority was, as it must always be, disappointed.

Wealth is a relative term, as poverty is; the nation most blessed is the one which possesses neither; but wealth, especially great wealth, can only belong to a few, and where there are a few very wealthy citizens there also must be very many poor ones.

The happiest nation is the one whose citizens can successfully compete with human misfortunes for a life of modest comfort, and can, by reasonable toil and industry, keep the wolf from the door while respecting the rights of humanity and the will of God.

California as a Manufacturing State.

Until recently California has not been classed as a manufacturing State. Human life has been active in it, and it has done great things in a startling way, and is fond of boasting about them, but downright steady industry has been to her a comparative stranger.

Speculation has been rife and whatever of success it has met with it has always been at the expense of the many, and through it the little of the poor has gone to swell the plenty of the rich.

In city and country it was the same; the industries were few and limited; the seeker, after employment, was driven from pillar to post and post to pillar, until necessity and circumstances made him a tramp, and if he had any ambition left he took the first opportunity to leave the State; and thus it is that other States with infinitely fewer natural resources and much harsher climates have passed us in the race of life in the number and quality of its population.

No wonder! For where lands are not monopolized, and cost little where Spanish grants exist not and farms are small and industries diversified, there will you find gravitate a desirable population, whose life is industrious and habits frugal. The very

Climate of California smiles on industry. And extends a hearty greeting of invitation which industry would long ago have accepted if the people of the State had only half encouraged her. But no! They had to be whipped into it like a disobedient child. The lesson of the past 4 or 5 years certainly has been as a

chastisement for the people of this land, which it is to be hoped will not be forgotten.

California has not gained much in population during the last decade as compared with many other States and Territories, for while she has gained during that period 54% she has been surpassed in percentage of population gained during the same period by Arkansas, Colorado, Minnesota, Nebraska, Oregon, Texas, Arizona, Dakota, Idaho, Montana, Utah, Washington, and Wyoming, and has been almost equalled by Florida, Michigan and South Carolina.

The princely State of California with its inexhaustible natural resources, its genial climate and its splendid location, with its 100 million acres of land, has, during the past 10 years, gained but 305,000 inhabitants, or less than one-third of a soul per acre, or but 34 persons per day! And why is this? The answer is simply there having been no assured profitable employment for new comers, we had no new comers.

Immigration societies may strain every nerve to induce immigration; transportation companies may reduce the price of fare; journalists may write up the advantages of the country, but all to no account unless

Profitable Employment

Can be given to those who venture to come here, and unless profitable employment can be given to such it is wrong to induce them to come.

How have such cities as Chicago, St. Louis, Pittsburgh, Cleveland, Newark, Jersey and Providence built themselves up? By stock deals, speculation, apathy or idleness? No! But by using well what nature has placed at their command, and by nurturing industry and their industries, their manufactures, their little shops, their mechanics and workmen, and protecting their local manufacturers and producers by patronizing and encouraging them, and thus keeping the people busy and content to remain with them and their money at home.

Now it is just this we must do here in California, in San Francisco. We must help our industries in a tangible and efficient way, and see that our shops are kept busy; that work is provided for our mechanics; that the blacksmith, the foundryman, the shoemaker, and the farmer are made content, and that all those economic industries that go to make up the manhood, the independence, the intelligence and the happiness of a community prosper and increase.

When we remember that in 1850, San Francisco had a larger population than Chicago, and that to-day the population of Chicago is nearly double that of San Francisco, and that the manufactures of Chicago turn out nearly three times the value of products, we are struck with the anomaly of the fact, and are apt to think that there has been something wrong in our way of managing affairs. It is true.

We Should Protect those Industries

That have sprung up among us, and encourage others to found new ones. It is only by these means we can give employment to those who seek it, or can encourage families to settle and remain among us.

We must see to it that goods made in California have the preference, everything else being equal; that taxes and imports on home manufactures be lessened, and facilities for doing business be increased.

That California should receive her fair share of government work.

That easy transportation facilities be extended to home manufactures.

That legislators should be elected who are friendly to the development of home industries.

That statistics should be obtained and information imparted affecting the healthy growth of existing and the founding of future industrial enterprises, and that a sound, strong and aggressive policy should be inaugurated and maintained in the interest of our material and economic home industries.

All this can be done by a small amount of necessary but effective co-operation in the general cause, and it is for this purpose we have organized an association that will be able to protect and encourage home manufactures.

By these means we will build up and strengthen the State.

We Will Raise and Manufacture

What we consume, and export the surplus to other countries not so hasty by nature, instead of huying abroad and expending that money elsewhere, which should be devoted to keeping the wolf from the door of our own citizens.

It is by these means we will engraft habits of industry on our people, crush out lawlessness and hoodlumism, abet virtue and diminish crime.

When we consider that a merchant importer can handle millions of dollars worth of goods with the help of a few clerks, and that the ordinary labor of one man, of one mechanic, produces, say, \$4 to \$5 per day, who is of the greater value to the community, the importer who buys from abroad and sells his goods with the aid of one or two clerks, or the manufacturer who builds in his shops an equivalent amount in value and gives employment to 300 men of family, doubles the value of raw material, and places 1,500 souls above want? Through this

Association of California Manufacturers There will be a legitimate encouragement given to home industry it has never had before in this State—a practical and definite protection thrown around it, it has heretofore lacked, giving it strength and vigor and independence.

Emulation and competition as between the

manufacturers of this State will be open and free, but we will insist that as manufacturers we must be met on fair ground, and everything else being equal, have the preference.

Heretofore we have been powerless to protect the interests of the many thousands of hands engaged in manufacturing and producing, and the intention is to make this association sufficiently powerful and tied together by identity of interests of the employer and the employed, and embracing every branch of manufacturing interest that it will command respect and attention. Its main object is

To Develop the Manufacturing Interests

Of California, and to do this it must protect those interests; it will stand and prosper on the broad ground that the welfare of the industrial classes is the best interest of the State, and situated as we are, so far from the main centers of population of our common country, we must and ought to depend upon our own resources, which we propose to cultivate and develop as far as practical, independent of and in competition with the producers and manufacturers of the Eastern states and of foreign nations.

We propose to do our best to prevent excessive taxation, directly or indirectly, on industry—to prevent ignorant and dangerous legislation affecting the interest of the mechanic, the workingman and the manufacturer to demand a fair distribution of government work on this coast, to impede the importation of all articles that can be profitably and properly made here, to collect and impart information to members affecting their interests, to use our best offices to open up new avenues of trade in our own country and abroad, and by all fair and honorable means in our power to make the manufacturing and industrial interests of the State successful and profitable, and to this end we invite every manufacturer in the State to join us, and we ask the good will and co-operation of every honest and industrious man and woman in the State. That California should take the foremost

Rank Among the Manufacturing States

Of the Union seems to me to be destined. Her position gives her the command of almost the entire Pacific coast of America, and of the islands and continents to the west of her. The climate of San Francisco and of numerous other cities in the State is such that her citizens can work comfortably every day in the year, and put in full time; the various lines of railroad center towards her golden gates, while her harbor is unsurpassed in capacity and safety, and is fed by rivers running far up into the interior of the State; her factories need neither warming in winter or cooling in summer, the winter mean in the city being 51°, and the summer 60°, while the mean temperature for a number of years in the month of January gave an

average of 49°. I may be pardoned if I submit

Some Statistics

Which may be dry, but good, as good wine is dry, hearing on the manufactures of the United States—some cities in the United States, and of California and San Francisco in particular—and I would here remark that the official returns of California in 1860 were so unreliable that I have omitted them.

First, I would draw your attention to the "added or industrial values" from manufacturing, found by deducting the value of the material used in manufacturing from the value of the manufactured products, which were as follows:

Year.	For the U. S.	For Cal.
1850.....	\$468,992,704	\$1,061,368
1860.....	\$533,245,351	\$1,006,197
1870.....	1,009,855,715	3,770,000
1880.....	2,118,208,760	31,243,363
1880.....	1,972,756,422	43,611,264

The industrial values in the United States from 1850 to 1880 has increased 4½ times, and those of California 3½ times.

The amount of capital invested in manufacturing was as follows:

Year.	In the U. S.	In Cal.
1850.....	\$533,245,351	\$1,006,197
1860.....	1,009,855,715	3,770,000
1870.....	2,118,208,760	31,243,363
1880.....	2,750,272,000	61,243,784

Showing an increase from 1850 to 1880 in the United States 5.23 times; in California, 60.8 times.

The number of hands employed were as follows:

Year.	In the U. S.	In Cal.
1850.....	957,069	3,964
1860.....	1,311,244
1870.....	2,053,906	25,392
1880.....	2,732,625	42,960

An increase from 1850 to 1880 in the United States of 2.86 times, in California of 10.84 times.

The wages paid were as follows:

Year.	In the U. S.	In Cal.
1850.....	\$236,755,464	\$2,717,110
1860.....	378,878,966	377,000
1870.....	775,884,243	13,136,732
1880.....	947,953,798	21,065,905

And the average amount paid to each hand (including women and children), was as follows:

Year.	In the U. S.	In Cal.
1850.....	\$247.37	\$685.45
1870.....	377.00	517.35
1880.....	346.90	495.46

This last table shows that the average wages paid in California was in 1850 2.37 times the average paid in the United States, while in 1870 it had fallen to 1.37 times, and in 1880 it had risen to 1.42 times.

The following table, which I have arranged from the census of 1880, by placing the relative ranks of each of twenty cities in the United States in the order as shown in the table, is of considerable interest, and should be inspected by those desirous of studying the relative values of the cities:

MANUFACTURING INTERESTS IN VARIOUS CITIES COMPARED, AND SHOWING RELATIVE RANK UNDER EACH HEAD.

Rank in Population.	Name of City	Rank.	Number of Establishments.	Rank.	Capital Invested.	Rank.	Hands Employed.	Rank.	Wages Paid.	Rank.	Value of Products.	Rank.	Value of Material.	Rank.	Added or Industrial Value.	Rank.
1	New York.....	11,339	1	\$118,306,356	2	227,352	1	\$37,030,021	1	\$427,926,437	1	\$288,491,691	1	\$184,454,746	1	
2	Philadelphia.....	8,567	2	157,143,357	1	185,527	2	64,265,966	2	324,944,935	2	199,155,477	2	125,187,458	2	
3	Brooklyn.....	5,201	3	61,646,749	4	47,587	3	22,437,457	3	177,225,142	3	129,085,061	4	48,137,051	3	
4	Chicago.....	3,519	6	68,833,885	3	79,414	3	34,653,462	3	249,022,948	3	179,269,610	3	69,813,268	3

20	Providence.....	1,205	11	27,177,008	11	22,891	12	9,494,110	12	42,807,512	15	22,794,237	16	19,805,285	11	

San Francisco's Rank.

From the foregoing, the city of San Francisco occupies the following rank and position:

Population.	Number of Establishments.	Capital.	Hands Employed.	Wages Paid.	Value of Products.	Value of Material.	Added or Industrial Value.
9	8	10	11	10	9	9	10

The local assessor's reports, to be of any value at all, should show the actual condition of the industrial interests in San Francisco is not sufficiently reliable to be of any use. The industrial condition of the State and city it is expected will be clearly and correctly shown by the tables and statistics that will be prepared by this Association.

Mr. J. R. Dodge, the statistician of the U. S. Bureau of Agriculture has divided the States and Territories of the Union into four divisions or groups, based on the percentage of population engaged in agriculture, as follows:

First group having.....	30	and less.
Second group having over.....	30	and less than 50.
Third group having over.....	50	and less than 70.
Fourth group having over.....	70

And he finds as follows for the year 1882:

If the foregoing statistics are correct, it very clearly shows the vast increase in the value of land product per head and the amount of wages paid due to the diversification of industry and introduction of manufacturing in those States included in the first and second groups.

The growth of the manufacturing interests in the United States is very remarkable—for when we look back to the year 1860, we find that the value added to raw material by the labor and skill of the mechanics and laborers employed in manufacturing was \$354,000,000, and that twenty years from that date, this added value was increased to \$1,973,000,000—we are struck with surprise, and look to some other cause than that of increase of population, for while during that period the population of

(CONTINUED ON PAGE 166.)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ZEILE.—*Ledger*, Feb. 23: The Zeile is one of the few mines in the county that pay off every month with clockwork regularity. Some idea of the value of this mine in contributing to the prosperity of Jackson may be gathered when we state that nearly 120 names were on the pay-roll last month, and the sum disbursed was over \$9,000. Whilst the ore met with in this mine is low-grade—so low in fact that without the most economic management it could not be worked profitably—yet in the number of men employed it has scarcely an equal in the county. It is really a big mine in everything except the actual yield of gold per ton. During the summer months the pay-roll sometimes runs up over \$15,000 a month. The ore-bodies is of vast extent, and the amount put through the mill daily averages at least three tons to the stamp—or 120 tons every 24 hours.

MIDDLE BAR TUNNEL.—The big tunnel is now in between 600 and 700 ft. The breakage of the air-compressor shaft brought both drills to a standstill for several days this week. Everything is now in running order again, however. The face of the tunnel is in the hardest kind of rock, and progress is necessarily slow. It is believed that this hard strata will soon be passed, and that it will be succeeded by ledge matter.

MISCELLANEOUS.—Amador county can boast of the heaviest gold producing mine in California. The Plymouth Con. is far in advance of all competitors. In seven months from June last, when the consolidation of the Pacific and Empire was effected, it has paid \$350,000 in dividends alone. The Standard of Bodie comes next with 13 dividends for the entire year, aggregating \$325,000. The owners of the St. Julian had about 50 or 60 pounds of their richest ore pounded in a hand mortar on Monday last. It yielded 22 ounces of gold and fine rock and sulphurets mixed. When smelted it is expected to yield from 18 to 20 ounces of pure gold. The refuse will no doubt yield several ounces more. At the mine they are getting together a quantity of rock for the purpose of having a crushing at the Kelly mill at an early date. The Gove Company has started work on the south or old shaft. The work consists of simply repairing it to the water level. It is reported that work will commence in earnest in spring.

THE ST. JULIEN.—Amador *Dispatch*, Feb. 23: The proprietors of the St. Julien mine have purchased the small one stamp quartz mill lately used at the Tripp mine and are having it removed. It will probably be ready for operation during the latter part of the coming week. During the meantime the St. Julien still continues to produce very rich rock as usual.

THE MAHONEY.—We understand that everything has been arranged for the transfer of the Mahoney mine at Sutter creek, and that work will be resumed in the mine as soon as possible.

Butte.

THE SPRING VALLEY MINE.—Butte *Record*, Feb. 24: We notice a change has been made in the superintendency of the Spring Valley mine at Cherokee, Mr. G. P. Williams retiring, and the Secretary of the company, Louis Glass, taking the position of Supt. Mr. Glass has almost been reared in the mine, having been connected with it as boy and man for a quarter of a century, and for the past ten or twelve years has been the resident secretary of the company. While perfectly familiar with the working details of the mine, and of the means necessary to operate it successfully, Mr. Glass is well known to the people of Butte county, and to all who are likely to be damaged by the debris from the mine, and can, if any man can, while working the claim successfully, and to the satisfaction of the stockholders, deal satisfactorily with those with whose interests the working of the mine may conflict. A recent statement by Mr. Glass, showing the amount taken from the claim, and where it had been expended, appeared in the *Record*. That statement showed conclusively that the greater proportion of the millions taken from the mine had been expended in Butte county, and must have been, therefore, an important factor in the progress and prosperity of the county. We believe Mr. Glass, from his long familiarity with the mine, will be enabled to so conduct it as to render it profitable to the stockholders, without damage to those who reside in the valley below, and to continue it an inexhaustible bank which shall continue to contribute its millions to the prosperity of Butte.

Calaveras.

MINING IN TOWN.—Calaveras *Chronicle*, Feb. 23: John Peek, Amile Pellaton and Will Hutchinson prospected the ground at the foot of the lane leading to the schoolhouse, and finding good encouragement, they set sluices and commenced pitting the dirt through the boxes last Wednesday. The first half day's washing "showed up" very well.

INTEREST PURCHASED.—Mr. Joseph O'Neil recently sold his quarter-interest in the "Green Mountain" gravel claim in the Chili Gulch, to Arseen Berthel.

El Dorado.

BERRY DEVELOPED.—*Mountain Democrat*, Feb. 23: Because but occasional mention is made of our mining industries, it by no means follows that they are at a standstill. The Havillah, at Nashville, is rapidly being developed into one of the very best mines in the State, and now gives employment to about 30 men. With energetic and intelligent management, it could be made to yield a fabulous amount during the next five years. O. P. Hart owns a claim adjoining, which, from prospects, appears to be equally as reliable. At the Springfield, sinking continues, and in the course of a few months the mill will be started up on ore that will give a net profit of from \$6,000 to \$10,000 per month. The Grand Victory has been steadily in operation all winter, running from twenty to thirty stamps, and in a short time the whole fifty will be in motion. The ore is low grade, but there is an immense ledge of it, and by close economy, yields a fair profit. The Pleasant Valley, which has yielded fairly for several months past, is now being sunk upon to a greater depth. In close proximity to this city, but two miles are now in full operation with mill pro-

cess, and are both gravel mines—the Green Mountain and Elf—both having ten stamps. The Rosecrans, near Garden Valley, with its ten-stamp mill, has been in constant operation for several months, and the results are highly satisfactory. The Gopher-Boulder mine, which was closed down only a year ago for want of means to thoroughly open it, and which gives every promise of a rich mine, has been purchased by an Eastern company, and work will soon be resumed. At Slate Mountain, Dan Moncton is opening a mine that gives every promise of future success, and as he has plenty of capital back of him to fully develop it, we have every confidence in its final success. The Blair brothers are pushing their prospecting operations near Sportman's Hall, and are confident of ultimate success. If their theory proves correct, they will yet open up the richest and most extensive mine ever opened in the county. In Mountain and Consumes townships the outlook is very bright for the future, while at present the Mt. Pleasant continues to yield up its regular quota of from \$12,000 to \$15,000 per month, and the Crystal is paying handsomely, while a number of other properties are in course of development with most flattering prospects. On the North Side several mines are being worked that are remunerative, and a large number are being prospected; and as a whole, the outlook is unusually promising for that divide during the coming spring and summer, as it does, indeed, throughout the county. It will be seen from the above that our mining interests are by no means at a standstill, but with capital for development, our paying mines could be more than doubled within a twelvemonth. Besides the mines mentioned, a hundred or more claims are being worked from which therevenue is by no means inconsiderable.

Inyo.

DISAPPOINTED.—*Inyo Independent*, Feb. 20: The owners of the old dynamite mine, at Pine Mountain, had got three months' supplies, mining utensils, etc., ready to start the night before the big snow, which slammed the door in their faces, as it were, and shut them out for a week or more. This old mine has been laying around loose for the past nine years. An old shaft 70 ft deep shows good ore, and the 30 level, running south shows a large body of galena ore, which samples at the Elina furnace 56 ounces silver and 60 per cent lead. These old things will all be taken in; it's only a question of time.

FROM COTTONWOOD.—P. A. Chalfant arrived yesterday evening from Cottonwood creek, Deep Springs Mining district, where he has been engaged during the past four weeks in the preliminary work for the erection of the Greenly mill. This work has been progressed quite satisfactorily, notwithstanding the extremely unfavorable weather of the past three weeks. A force of from six to nine men have been employed upon the water ditch, which is now about complete. The two intervening ranges of mountains to be crossed in coming from Cottonwood to the river are covered nearly two ft deep with snow, just compact enough to make traveling for either man or beast laborious in the extreme. This fact may cause some delay in getting in needed supplies, therefore in the completion of the mill, though Mr. Chalfant thinks it can be got in operation early in April if not sooner.

ORE SHIPMENTS.—A. W. Eibeshutz shipped three cars of ore from the Brown Monster, last Thursday, consigned to Shelby & Co., S. F. Phil Cartier shipped ten tons from mines in Mazourka canyon to Elina, Wednesday.

SACRAMENTO MINE.—A cleanup of ore crushed from this mine, situated about nine miles east of Bishop creek, was made last Thursday, resulting in the neat find of 64 pounds of gold bullion; estimated value, between \$5,000 and \$6,000.

INDIANA MINE.—The new lessees of the Indiana mine, Swansea district, under Joseph Williams, as manager, are starting to take out ore from a very promising strata, the ore assaying on an average 400 ounces in silver and 28 per cent in lead per ton.

THE DEFIANCE.—The latest reports received here from the Defiance mine, Darwin, are to the effect that the recent strike in that property is improving in size and richness as the work of development progresses.

SWANSEA FURNACE.—The Swansea furnace, we are informed, closed down Thursday night. For what cause or for how long we are not informed.

FROM CERRO GORDO.—*Independent*, Feb. 26: Reports from Cerro Gordo just in, are that snow there in places is from 10 to 15 ft deep. Operations have been retarded on that account since the storm, but will be resumed at an early day—at least on the Ygnacio. The ore body in this mine is daily showing better and better.

Mono.

STANDARD CON.—Bodie *Free Press*, Feb. 20: During the week there were extracted and shipped to the mills 1,395 tons of ore; 838 ounces of bullion were received, and \$13,817.97 shipped to the company. Good progress is being made in timbering the north drift on the 1000 level, Upraise No. 2 is up 155 ft, showing the vein 4½ ft wide. The winze from south drift No. 2, 385-ft level, has been sunk 8 ft; total depth, 73 ft. The vein in the bottom is 4 ft wide. The stopes are looking well.

BODIE CON.—Bodie Con. showed its vitality yesterday by steadily rising from 77½ in the morning—at which figure there were some transactions—to 99½ as the closing evening quotation. This, too, in spite of the big bear, who reported so positively last Saturday that the ore had pinched out.

BULWER CON.—West crosscut No. 3 from south drift, 500-foot level, has been advanced during the week 12 ft; total length, 95 ft. The ground is hard.

Nevada.

WILL BE WORKED.—*Foot-hill Tidings*, Feb. 23: It will be gratifying to our readers to learn that Messrs. W. B. Bourn and A. W. Stoddart are meeting with success in their efforts to raise money for the purpose of starting the North Star mine. The gentlemen surely deserve success, for they are energetic and enterprising, and the opinion of every one here, and especially of those who know anything of the mine, is that it is a good mine and can be successfully worked. In the canvass the gentlemen had \$7,000 subscribed the first day. It speaks well for the future prosperity of this mine when not a single dissenting opinion is expressed as to its merits, and all seemed favorably impressed as to its value, and the probability of a speedy resumption of dividends

when the mine is got into good working shape. When the North Star was shut down it was paying considerably over expenses, and the matter of closing down the mine has always been a matter of wonder to those who were acquainted with its merits. When once the North Star starts work, it will be an incentive for other important enterprises to start up.

MCCORMICK'S MINE.—*Nevada Transcript*, Feb. 26: H. McCormick's mine on Gold Flat, in which a remarkably rich deposit of ore was struck a few days ago, has been troubled more or less of late by a rush of water, and operations have been suspended until another pump can be placed. The owner has been working there about six months, and is down 97 ft on the incline. He has had three crushings made at Martin & Michell's mill—the first paying \$18; the second, \$21; and the third, \$34. The pumping and hoisting have been done by water-power.

Placer.

THE ALTA DRIFT MINE.—*Cor. Placer Herald*, Feb. 22: Upon my return to Alta, I find that the Alta Gravel mine is still driving ahead day and night with three shifts, under the superintendency of W. E. Otis. They are now under ground about 200 ft from the shaft, in a southeasterly direction, and are making magnificent developments, as they are advancing closer towards the channel, with a continual improvement in their prospect as they go. But time and labor have demonstrated that they are possessed of a gravel deposit of great extent and of a high grade in quality. They are now operating on a line 800 ft to the northeast from the place where a rich strike was made ten years ago by the old defunct Ada Bell Co., and in a position transversely with the same channel. There are two placene river channels extending easterly from this place, main tributaries to Dutch Flat. About four or five miles of each of those lie within the rich auriferous belt, and will eventually be worked by drifting, as they are deeply buried under sand and lava, and can only be made available by the drifting process.

Plumas.

GREEN MOUNTAIN.—*Greenville Bulletin*, Feb. 23: During the past week there has been a good deal of talk about the recent developments in the Green Mountain mine, and some of the statements are a little too rosy. The long and tedious work of driving the tunnel to the Blake chimney, and the failure of the water supply that caused the mills to be stopped early in the fall, led to some embarrassment, and caused a good deal of anxiety, and when the chimney was reached at last, the relief was so great that it is possible somebody may have "slopped over" a little. Since the chimney was reached the vein has been opened fully, and is found to be 30 ft wide; a good deal of the ore prospects fairly, but how much gold it will actually yield can be determined only by milling. This ore body alone contains enough to keep the new mill busy for a long time. The almost ceaseless storm of the past month has piled up snow enough to ensure a full water supply, though two or three weeks may pass before any of it is available; but when the water shall be once let into the ditch, then no further hindrance to milling work need be feared till another winter shall come around. If this ore body in the Green Mountain mine shall come near what is hoped for in richness, then, possibly, the management might be determined to add steam power, to be used if water should fail. Aside from any interest felt here from the mine itself, this development in the Green Mountain is a matter of general congratulation. It fully establishes as fact, what has always been the general belief, that the veins in the range would improve rather than reverse, as depth is gained. This is certain to lead to great activity in mining during the coming season. Along the range are many ledges on which locations have been made, but on which the owners have never done more than the necessary assessment work; all were waiting to see how the Green Mountain would turn out. Not all of these claims, but certainly a good many of them, will now be worked vigorously, and it is hardly too much to say that the whole mountain side will be swarming with men during the coming summer, all busy burrowing into new stores of wealth.

Sierra.

LATEST REPORT FROM THE COLUMBO MINE.—*Sierra Tribune*, Feb. 23: F. S. Fisher and Philip Deidesheimer gave the following notes concerning the Columbo mine to a reporter last week: The late cold weather has slackened the water supply at the mill somewhat and necessitated the hanging up of one five-stamp battery. The other fifteen stamps have been kept running pretty regularly. The slight trouble that was experienced with the wire-cable at the start is now wholly obviated. A new wood-chute, leading to the mill, was completed last week, and works in a very satisfactory manner. Work is going steadily ahead in both the upper and lower tunnels. A new ledge was recently encountered about 460 ft from the mouth of the upper tunnel. At the point tapped the vein measures three ft in width and assays something over \$15 per ton.

THE MARGUERITE MINE.—The outlook for this property was never better than at present. The work of opening up the fourth level is progressing favorably and a fine body of ore is being developed. The Company have expended in the neighborhood of \$40,000 lately in making improvements and purchasing machinery. A portion of the machinery is now at Truckee and will be shipped to the mine as soon as the condition of the roads will permit. The hands at the mine were paid off in full this week. Supt. Myers is exerting himself to place the mine on a dividend paying basis, and he will probably succeed whenever the improvements now under headway are completed.

STOPPED.—*Mountain Messenger*, Feb. 23: The Marguerite mine has temporarily stopped work owing to inability to keep the shaft clear of water with the present machinery. Fifteen stamps have been crushing at the Colombo. The new ledge recently discovered, has a width of three ft, and the ore assays fifteen dollars a ton. A wood chute was lately completed. The Marguerite employees were paid the other day. Work is favorably progressing at the mine. The recent improvements and new machinery has cost about \$40,000.

BALD MT. EXTENSION.—Last Sunday the Bald Mt. Extension Co. cleaned up, in their small dump, over 105 ounces, 16½ pennyweights, \$1,668.57, averaging \$3.92 per carload—50 carloads. The recent freezing spell so effectually checked the water flow, that little washing could be done; but with the present warm weather the prospect is fair that

the 3,000 or more carloads of rich gravel accumulated in the large dump, will be sluiced out and cleaned up ere the close of this month, affording a handsome dividend for February. The main tunnel is being steadily pushed through the lava flow, and, as near as can be ascertained, must now be in 350 ft or more, beyond which is now a settled question will be found the extension of the pay lead.

STRUCK GRAVEL.—The owners of the Ballarat Mining Company have found gravel in their tunnel, at a distance of a little over three hundred ft from the dump. This claim is located up the ridge from the old Cold Canyon diggings, and is, doubtless on the same channel. At last accounts the gravel had not come down to the bottom of the tunnel, but the owners are confident that they are low enough. The gravel is all quartz and coarse. The owners have a large claim, covering the channel for a long distance. The claim will not be opened out and ready for work for several months, but from all indications it will prove as rich as ever were those below. The owners are A. McIntyre, M. McFarlane, John McDonald and others whose names we do not know.

Shasta.

OUTLOOK FLATTERING.—*Cor. Trinity Journal*, Feb. 23: The miners' outlook for old Shasta county is indeed flattering. The gold yield from both placer and quartz mines, will undoubtedly be very large, and both these industries are at present being pushed forward vigorously. It pleases your correspondent very much to see this storm, for it will insure both Trinity and Shasta counties a prosperous year. The present outlook is certainly encouraging. Without a doubt the long-laid Clear creek ditch will soon be in operation again. Mr. Truett is bere with that object in view. If satisfactory terms can be made whereby to start the ditch in operation again, it will be done immediately and will be of vast benefit to this county. A very rich discovery of an immense body of silver ore was, a short time ago, made by a man named Stovell, between the head of Spring creek and Flat creek. The finder has very appropriately named his rich find the "Grab," on account of an attempt being made to jump it. It is currently reported that the "Grab" is much richer than the famous Iron Mountain mine.

Siskiyou.

MINING PROSPECTS.—*Yreka Union*, Feb. 23: The miners in all parts of the county are jubilant over the fair prospects ahead, and all the leading mines throughout the county will be vigorously worked this season, and undeveloped sections will be thoroughly prospected. The railroad tunneling north has attracted many of our practical miners the past two years, and now that railroad work has been suspended, they have returned and the majority of them will engage in mining. More prospecting will be done this season than there has been in any one season in the past ten years, and it is quite probable that some foreign capital will be enlisted for that purpose. The mines on the Klamath have yielded large profits to their owners the past few years and they will be operated on a larger scale than ever before, and will undoubtedly pay an increased dividend in proportion to the additional amount of capital and labor expended. Untold wealth remains buried in the bed of McAdams creek and its tributaries, and capital invested in that section will almost double itself in a comparatively short time, while the lodes on Indian creek will prove a source of great profit to their respective owners, with excellent chances of new and richer discoveries being made. At Callahan and in the Salmon section—both rich mining districts—work will be energetically inaugurated in all the placer and quartz mines, and will produce a large revenue. Everything considered, the outlook is exceedingly bright, and will bring us into recognition as one of the leading mining districts in the State.

Trinity.

MORE GOOD STORM.—*Trinity Journal*, Feb. 23: The past week has added 3.11 inches to the water-fall of the season, much of it being snow—16 inches of the latter falling on Tuesday. During February, 3.56 inches of water has fallen at this place, making the total fall for the season to date, 22.13 inches. Cold nights have kept the water back, and up to this time miners have had but a limited supply. With warmer weather which must come soon, the flood-gates will be opened and water supplied in abundance. The opinion is freely expressed that mining in Weaver Basin will continue until July at earliest, while many predict there will be water for sluicing until August 1st. A good mining season is now certain, and plentiful spring rains will make it even better than now appears. Trinity is all right.

Tuolumne.

CHISPAS.—*Tuolumne Independent*: During the recent heavy rains the boys have found a great many chispas and fine gold on the Big Nugget ground, adjoining the Divoll Bonanza claim. These are the two richest pocket claims yet discovered in California. Capt. Colby, the owner of the Nugget mine, is getting ready to sink in the Divoll and will make extensive development. The engine and hoisting works are being repaired for that purpose.

THE MILL and works of the Toledo mine are being moved on the Willetta, on the Tuolumne, just below Jacksonville. The mill was built some two years ago by the Clement Bros., of San Francisco, and for reasons unexplained the mine has never been worked to any extent worth note. Messrs. W. G. Long and Joe Hampton, in removing the mill, found everything in excellent order—even to the mortar blocks.

SEVERAL RICH POCKET mining strikes have been made in our country during the past six weeks, but with a perversity most galling to an enterprising editor, the fortunate strikers refuse to let it be known to an interested public what was the amount received from mother earth. Secretiveness is good—very good—but who does it benefit in this case?

NEVADA.

Washoe District.

UNION CON.—*Virginia Enterprise*, Feb. 23: The east crosscut started on the 3100 level, at a point 85 ft south of the joint Sierra Nevada shaft, is out some 15 ft. As yet there is not much change in the appearance of the material passed through. The strong current of air rushing through the main drift on the 3100 level, is fast cooling off all parts of the mine. The east crosscut must soon cut some of the

ore streaks found in the station at the winze and in the joint Sierra Nevada crosscut, which was run out east a distance of 28 ft from the station.

CON, VIRGINIA.—Have about completed the work of excavating a station at the bottom of joint California winze No. 2, on the 2900 level. From this station a drift will be run to connect with the main south lateral drift. The distance to be run is about 200 ft. When this connection is made active prospecting will be resumed. The material on the 2900 level, at all points, is of a favorable character.

ALTA.—The ground in the face of the east crosscut on the 2150 level is blasting better than it did last week, and pretty fair headway is now being made. The west drift on the same level is in ground that works well, and some stringers of ore of low grade are now being cut. The pumps are working well and smoothly. They handle the water without any trouble, running at but six strokes per minute.

SIERRA NEVADA.—The northeast drift on the 3100 level is still in vein material, with some quartz. Some work remains to be done on the 2900 level in order to regulate the ventilation before crosscutting is commenced. Already the mine is being rapidly cooled by the strong current of air that passes through the main drift on the 3100 level.

GOULD AND CURRY.—The joint Best and Belcher winze down from the 2300 has reached the 2700 level. A station is being excavated at the 2700 level. At this point it is very hot, owing to the dripping in of hot water from the soft ground above.

YELLOW JACKET.—Now that the mills on the river are able to run all their stamps, a full force of men has been put to work in the mine, and a prosperous season has doubtless been entered upon. With the present ample head of water there is no danger of the wheels being stopped by frost.

SAVAGE.—Good headway is making in the north drift on the 2600 level. The ground ahead is wholly unexplored, as is much that lies above and on all sides.

BELCHER.—The mills on the Carson river are running to their full capacity, and a full force of men is employed in the mine. No more trouble at the mills is anticipated this season, unless from lack of water in case of a flood in the river.

COMBINATION SHAFT.—Sinking is progressing well. The shaft will now soon reach the 2800 level, at which point a station will be excavated, and a drift started west to connect with the Hale and Norcross on that level.

HALE AND NORCROSS.—A sump of ample depth has been completed, and a working station is being cut out at the 2800 level. The material encountered favorable character.

MEXICAN.—The repairs which have been making at the several levels from the 2500 down to the 3100 level are now about completed, and active prospecting will be resumed in a few days.

IMPERIAL.—The west drift is now in the region of the old upper levels, and explorations will be in order. The drift opens a road for the Alpha and Exchequer, as well as the Imperial.

ANDES.—The drifts are going ahead as usual, and are cutting into quartz of a favorable appearance. About the usual amount of low grade ore is being extracted.

BEST AND BELCHER.—The joint Gould and Curry winze below the 2500 has now reached the 2700 level, where a station is being cut out. The material is birdseye porphyry.

CROWN POINT.—Are again at work with a full force of miners. The mills on the Carson river, are all thawed out and running right along.

Columbus District.

MOUNT DIABLO.—*True fissure*, Feb. 23: There are no developments of note to report from the mine this week. A winze has been started from the west drift on the third level and is now down 34 ft. It shows some low grade ore in the bottom. Winze No. 5 is down 68 ft and shows a little ore of good grade. The north and south crosscuts are being driven on the intermediate between the second and third levels, but show nothing of value. The main east drift on the second level has been stopped, after being extended 106 ft, and a south crosscut has been started some 50 ft from the face. This crosscut shows spots of good ore.

COLUMBUS CON.—The work of sinking the main shaft has been discontinued. It has attained a depth of 355 ft, making a sufficient space in the mine to prospect for several months to come. The third and fourth levels are totally unexplored. After the fourth level station is completed a crosscut will be started towards the ledge. The third level connection has been made and as soon as proper arrangements have been made, such as laying a car track and cleaning out the north end of the drift, the work of extracting ore will be resumed.

RIDGE.—Richard Creer and Fred Corhill are the owners of a prospect bearing this name. It is located at the western end of Candelaria hill and a little above the head of the canyon in which has been run the upper tunnel of the Vanderbilt company. A tunnel has been run about 30 ft and has cut through several seams of ore yielding good assays. The work in the winze, and thus far at the station, has been of a development is progressing favorably.

Eureka District.

EUREKA TUNNEL.—*Eureka Sentinel*, Feb. 23: There are considerable good ore and screenings awaiting shipment at the Eureka tunnel, but the snow in the canyon is too deep to think of taking the teams up to remove it. In the mine the prospect is exceedingly good, but the capital necessary to do the required dead work is wanting. Foreman Maxwell is doing as well as can be expected with his small force of men. He has made a connection from the north drift that was run a long time ago from the 60-foot point in the vertical winze from the south winze to the north Addison chamber. Here is where the principal prospecting is being done and where the best developments are being made. Ore is being extracted from an exceedingly good-looking vein of yellow carbonate, making downward at an angle of about 55 degrees, the thickness of which, at present, is about two ft. A short distance from this is another vein in course of development, the ore lying rather flat and looking like an exceedingly good prospect. Out of all this ore there come some very rich

chloride and black metal, similar to heavy rich ore formerly taken from the Addison chamber. Very little prospecting is being done in the bottom levels, but the character of the ground and the indications are sufficient to justify the use of capital for development.

Grantsville District.

NOT ABANDONED.—*Grantsville Bonanza*, Feb. 23: Grantsville has been under a cloud for over two years, and tempest tossed, but none of its mines are abandoned nor are they likely to be. There will be a resumption of mining operations on an extensive scale as soon as things are arranged to suit the parties owning the leading mines in the village. When the Alexander Mining Co. closed down there was ore enough exposed in the mines to run the 40-stamp mill for years. The mines of Grantsville contain immense bodies of low grade ores, and they only need to be properly handled to produce enough pay rock to keep 200 stamps pounding steadily; then, instead of Grantsville being almost the deserted village that it is, hundreds of men would find employment delving in its hills. Unfortunately we cannot force prosperity. The few people that have remained with Grantsville have unbounded faith in the mines, for they know that with proper management handsome returns in the shape of silver bricks would be the gratifying results.

Lewis District.

SHIPPING ORE TO UTAH.—*Salt Lake Tribune*, Feb. 23: J. P. Courter, who had charge of several mines at Little Cottonwood, from 1877 to 1878, is in town, and is registered at the Metropolitan. Mr. Courter is an old Nevada miner, having been located there almost constantly since 1863. He is now established at Lewis, Nevada, having in charge the Eagle, Star Grove and Highland mines at that point, which are owned by an Eastern company. He is now here to make permanent arrangements for the shipment of ore from those mines to this city. Shipments have been made from Lewis since December last, but an agent had to be sent with each shipment. Mr. Courter desires to avoid the necessity of sending an agent with every consignment, and will, therefore, secure a regular consignee here, to whom all ore can be regularly sent.

Mount Cory District.

REDUCTION WORKS.—*Esmeralda Herald*, Feb. 23: The Mount Cory reduction works are now completed, and running smoothly. The machinery, leaching vats, and everything connected with the mill is in fine running order, and is a success as far as the limited time of trial has allowed of investigating its operations. About 1,000 tons of ore is on the dump, and the ore teams are hauling as fast as the inclemency of the weather and deep snow will permit. It is hoped and expected that it will be a thorough success for the company, and also for this part of the country.

ARIZONA.

MOHAVE Co.—*Miner*, Feb. 20: Our miners don't worry now whether the quartz mills in this county run or not. The Atlantic & Pacific railroad has made them independent of the mills. The millmen will have to knuckle down to the miners now that the boot is on the other foot. There are two mills running in Mohave at the present time, not counting the sampling mill at Kingman which can get away with more ore than a 40 stamp mill and which is kept running all the time. Louis Davidson has bought out Robert D'Yhr's interest in the Oro Fino mine for \$450. Louis will be a millionaire yet.

JUBILANT.—*Arizona Miner*, Feb. 26: The late almost unprecedented storms of rain and snow have made placer miners jubilant. The hydraulic diggings on lower Lynx Creek, under the superintendency of W. H. Jones, are turning out an abundance of yellow wealth, and we hear that more than a hundred prospectors are working the gravel beds of the famous "Rich M'n" or Antelope Hill, in Weaver district and that a great deal of gold is being found in them. Although the late storms have been a serious drawback to some mining enterprises causing them to shut down temporarily on account of blockaded roads and the difficulties of transportation, yet upon the whole the people have cause to congratulate themselves on the prospects of the coming season. We hear that the roads to the United Verde mines are badly damaged, which will necessitate the temporary shutting down of the smelter on account of insufficiency of coke. The damage is of a temporary nature, however, and will not materially affect the most productive mining enterprise in the territory. Very little is being done with the mines in the Hassayampa mountains and on Turkey Creek on account of snow.

COLORADO.

THESEVEN-THIRTY MINE.—*Georgetown Courier*, Feb. 20: The work of development is being actively pushed on this mine, between 60 and 70 men being employed. Twelve drifts are being run—seven on the east side of the gulch, and five on the west. Of these, the tunnel levels, 180, 240, 310 and 375 feet, all on the east side, show fine seams of ore. The 310 and 375-ft levels east are being run on contract and the ore held in reserve. Sinking the main shaft will not be resumed until more powerful hoisting machinery is erected. Arrangements have been made by the owner, with a company of twelve miners, to push the No. 1 level east continuously during a couple of years, the owner allowing them an extra year in which to extract ore from the stopes so opened, which are 100 ft high. After the work of driving this drift has been paid, the owners take one-fourth of all the mineral produced, and the remaining three-fourths go to the miners. This plan of association has been in vogue in Cornwall, where it is called "Tributing." In some parts of this country the same plan has been adopted and seems to work well. No advance for wages is required from the owner of the property, and a stimulus is given to the miner, estimated to produce one-third more work, by a direct interest in the proceeds of his labor. Pomeroy & Co., lessees on the Dunderberg, recently encountered a six-inch streak of good mineral on the 3d level of the mine. Ten tons of ore has been taken out in two weeks, which runs 200 ozs. silver per ton. Larson, Salene & Co., who took a lease on the Tishomingo lode last week, started up work this week. They are at present engaged in cleaning out the shaft preparatory to sinking and putting up buildings. Levels are being run east and west at a depth of 260 ft in the

Old Settler mine, near Idaho. The ore streak averages from 12 to 18 inches wide, and has maintained its width well so far as the levels have been driven. The Welch, on Leavenworth mountain, has lately been leased to Messrs. Neville & Gilmer, who propose to push the thing ahead as fast as good muscle and their means can do it. Good muscle wins when good grit backs it. Mr. John M. S. Egan, Supt. of the Pay Rock mine, returned from New York last week, and went to Denver on Monday with the inventor of the Huson Tramway. He goes to make arrangements for placing a tramway from the Pay Rock mine to the mill. A party of sub-lessees on the Mendota made a strike last week, over which they are much elated. They commenced sinking a shaft a short time ago, then having six inches of mineral. Last week, at a depth of 32 ft, the vein widened out to about four ft of solid galena. Indications are good for the running of a prospect tunnel into Griffith mountain, to cut the Sonora and Griffith lodes. After it strikes these lodes it will probably be continued into the mountain. The mouth of the tunnel is to be immediately east of Bullock & Strickler's barn.

IDAHO.

MINERAL DISTRICT.—*Weiser Ledger*, Feb. 18: Mr. Burton, who is engaged with Mr. Heagerty in the location and construction of the quartz mill at mineral district, was here on Tuesday, returning to his work on the following day. We are informed by him that the mill will probably be erected at the mouth of Dennett creek, near Snake river. A strong force of men are at work on the road up the creek, but the ground is hard and frost-bitten, and progress slow. A townsite will likely be laid out there, and another has been surveyed near the principal mines. We hear of several business houses soon to be established there. Mr. M. Duffy, one of the owners of the Black Hawk, spent several days here this week. That district has been well represented here of late by Messrs. Flowers, Holcomb, Smith and others. Indications point to lively times among the mines next spring.

COEUR D'ALENE.—*Oregonian*, Feb. 23: A. F. Parker, editor and proprietor of the *Coeur d'Alene Eagle*, at Eagle City, in the Coeur d'Alene mines, is in Portland on business; and knowing that he had spent four months in the mines and was well qualified to form a correct opinion of the resources of that section of the northwest, we obtained the following interesting data in the course of an extended interview: No trail has ever been laid out from any point east of the Coeur d'Alene range of mountains, and the only way to come in from the east is by the way of the Mullan road, and that, like the road over Jordan, is a hard road to travel. Spokane Falls is also making a grand attempt to capture the trade of the mines under pretence that it is the nearest accessible point, but the facts are not so. Fort Coeur d'Alene is the only accessible base of supplies; and Rathdrum, twelve miles distant, is its nearest railroad point, while Spokane Falls is thirty miles distant. From Fort Coeur d'Alene, travelers can either take the Mullan road to the old Mission—distance thirty miles—or they can take the steamers to the same place—distance, sixty-two miles. From Fort Coeur d'Alene to the old Mission by water is a very pleasant trip, and is made without danger, as the waters are so deep that no bottom can be seen for the entire distance. From the Mission, which is really the key to the mines, travelers have another choice of routes. They can either take the Mullan road to Evolution—distance, twenty-one miles—thence over the mountain trail, twenty-two miles to Eagle City, or they may take the route up the north fork to the mouth of Eagle creek, either by boat or trail—distance, forty-five miles. The bulk of the travel to and from the mines has always taken this route, as it is open and passable when the alleged trails to the eastward are blockaded by snow. In short, the mines can only be safely reached from the westward. As to the mines, the permanency of the camp is established beyond a doubt, for enough money was taken out last year from the claims then opened to justify the development of the deeper portions of the creek bottoms, which will require the expenditure of more or less capital and labor to work successfully. But while the extent and richness of the camp have been satisfactorily demonstrated, the claims are not so enormously rich as to justify such a stampede as promises to flock thither this coming season. Of the quartz interests but little is known further than that undeniable rich surface prospects have been discovered, and these discoveries were made so late in the season that sufficient work has not been done to prove whether they are likely to be permanent or not. It is mainly a base metal or galena camp, although what is known as the "mother lode of Pritchard creek" assays very high in gold, and carries largely of black sulphurets. This lode crosses Pritchard creek half a mile above the famous "Widow" claim, and is owned by Harris, Clark and King, and is very favorably situated for working. A great deal of unnecessary exaggeration has been told about the richness of the placer diggings and of the amount of gold already taken out, but a careful estimate of the total production of gold so far will not exceed \$20,000. For the prospector the Coeur d'Alene country offers a most inviting field. Under the generic title of Coeur d'Alene, is included all that region whose main streams are the Coeur d'Alene, the St. Joe, St. Mary's, St. Regis and Pen d'Oreille, with their countless tributaries. Still farther southward and adjoining this promising field for exploration are the northern tributaries of the Clearwater, which are equally inviting and undeveloped. The district in which the mines are situated lies between the north and south forks of the Coeur d'Alene river, and this region, which is the "camp" proper, embraces an area of sixty miles by thirty miles, while outside of this the country is practically a *terra incognita*.

MONTANA.

THE BELL SMELTER.—*Inter-Mountain*, Feb. 23: The Bell smelter, after lying idle for several months pending the sinking of the new shaft and the development of the new ledge from the 400-foot station, resumed operations on last Saturday, and is now making a smooth and successful run. About 600 tons of ore are now at the works, which amount is now being increased daily. It is of fair grade, averaging from 15 to 22 per cent copper and 25 ounces in silver, and is susceptible of profitable

reduction. Under the management of Walter J. King, the smelter will make a creditable run, and regular matte shipments will be made.

THE MOULTON.—*Inter-Mountain*: The condition of the Moulton mine and mill, as well as the financial affairs of the company, are particularly gratifying. It will be remembered that one Bowers, a member of the syndicate which agreed to sink the shaft and erect the mill, did not live up to the contract in regard to the shaft and started up the mill at least six months before the condition of the mine justified so doing, and for no other reason than to get his percentage out of the sale of the mill machinery. The result of this sharp practice was that the mine not being sufficiently developed to supply the required amount of good ore, the mill was often run at a positive loss. To have closed it down would have been disastrous. By active, economical and skillful management, however, the mine gradually gained on the mill, and last fall it became possible to begin the payment of the company's indebtedness. The good work has since continued. With Patrick Clark underground, J. K. Clark to look after the mill and W. A. Clark to supervise the entire enterprise, operations were conducted with such success that the outstanding obligations were met as rapidly as possible and to-day the Moulton company does not owe a cent, has an abundance of good ore in the mine, and is accumulating a surplus.

DRUM LUMMON.—*Cor. Inter-Mountain*, Feb. 23: In the Drum Lummon now everything is in full blast. The huge compressor machinery is in motion, and in all parts of the mine striking hammers and hand drills have been discarded, and compressed air takes the place of muscle. The lower tunnel is rapidly approaching the lode, and not only the inhabitants of this camp, but the Territory at large—and especially ye stockholders—are waiting with almost bated breath to see what the lower tunnel will develop. Should the tunnel strike it one-half as good as above, many there are who will be "fixed," but should fate decree otherwise, hay rope will be in demand in this gulch to tie up much-worn blankets, and "the Coeur d'Alenes or bust" will be the cry. Yet there is enough developed ore in the Drum Lummon to keep thirty stamps busy for several years. It is hoped that the Empire—one of the rich spurs of the Drum Lummon—will change hands this spring, then two big companies will be operating here, to be followed in the near future by more. The pan and settler process for saving fine gold at Gloster has proven a success, and has demonstrated that there are many mines in this region that can be made to pay handsomely by using the same method of reduction.

NOTES.—The Gagnon shaft, upon which sinking was recently resumed from the 500-foot station, has reached a depth of 600 ft, and a crosscut to tap the ledge is now being driven southward from the foot wall. The Liquidator shaft has reached the 300-foot station, and the ledge is now being crosscut.

OREGON.

NOTES.—*Jacksonville Times*: More rain is wanted by the miners, and soon, too. The Cayote creek mines are being worked with a full head of water. Miners in Josephine county have plenty of water and are busily at work. Considerable mining is going on in the Grave creek district, where water is abundant. Simmons, Ennis & Co. have water in their big ditch near Waldo. Work is progressing satisfactorily there. The late storms have enabled many of the miners in these parts to do more or less work; but more rain is necessary for advantageous operations. Wimer & Co. were compelled to shut down their mine near Waldo for a few days last week, owing to the extreme cold weather, but are busily at work again. A large amount of snow lies at the head of the Sterling company's ditch, which will afford quite a run. Supt. Ennis informs us that operations have not been commenced as yet. The Yreka creek mining enterprise having proved a failure after being prosecuted several years, the machinery, tools, etc., are being sold. The diggings can doubtless be purchased cheap, also.

UTAH.

A REVIEW.—*Salt Lake Tribune*, Feb. 23: The tremendous storms have made unprecedented difficulties in the canyons and movement of ore is much restricted. The receipts of bullion and ore in Salt Lake City for the week ending February 20th, inclusive, were \$114,191.47, of which \$109,431.47 was bullion, and \$4,760 ore. This is more than double the receipts of the week previous, but undoubtedly part of this week's returns belong to those of the week before. The shipments from this city for the week ending February 16th, inclusive, were 41 cars of bullion, sent east, 1,029,572 pounds. The Horn Silver shipped during the week, 11 cars of bullion, \$33,000; bringing its total for the year to date, \$276,000. The quarterly dividend announced for February 15th, was duly paid, being the 12th, amounting to 75 cents per share, or \$300,000. Total dividends to that date, \$3,000,000. During the year 1883, the dividends \$1,100,000, and there were sold in New York, 95,592 shares of Horn Silver stock, ranging in price from \$4.60, the lowest, to \$8.63, the highest. The opening price for the year 1883 was \$6.50; the closing, \$6.25. The Ontario product for the week was 21 cars, amounting to \$35,917.94. The ninety-first dividend of the Ontario, amounting to 50 cents per share, or \$75,000, was paid in New York on the 31st ultimo. Total of ninety-one dividends, \$5,225,000. During the twelve months of 1883 there were 10,043 shares of Ontario stock sold in New York, at prices ranging from \$18.00 to \$35.50. The opening price for that year was \$35.50; the closing, \$29.25. Total dividends for 1883, four of \$75,000 each, \$300,000. The Hanauer smelter report for the week shows a product of 21 cars, \$40,514. The Stormont having shut down, there is now no production at Silver Reef. This shutting down is but temporary, however, caused by the high water, and the Stormont will soon resume. The Christy is yet closed down. Capt. Lubbock, in charge of its operations, passed through Salt Lake this week on his way to San Francisco. He reports that his company has large reserves of medium grade ore that will pay, and their prospecting has developed some very encouraging bodies of high grade ore. They will resume active production about June 1st, on a more favorable basis than ever before, the miners having freely consented to such a reduction of their pay as will materially assist the company in making both ends meet.

Mining Share Market.

There is very little life in the stock market, but more attention is given to the Bodie stocks than any others. On the Constock, however, at the old bonanza mines California and Consolidated Virginia—they are fast getting their ground in shape to resume prospecting operations. It has been so long since any prospecting was done in these mines, that all will be glad to see that kind of work resumed.

The Hale and Norcross folks are now about ready to explore their 2800 level and the ground on the levels above where prospecting operations were discontinued on account of water. There is much ground between the 2600 and 2800 levels that was hardly passed through which may now be thoroughly examined. At the Savage they are now in a position to thoroughly explore a large area of ground on the 2600 level.

At Gold Hill all is now going on prosperously at the leading mines. The mills on the Carson river are now running to their full capacity, and full forces of men have been put to work in the mines. It is not likely that the mills will be again frozen up this season. The only thing now liable to stop them is a flood. Should there be a flood in the Carson river, the water might so back up on the wheels as to prevent them from running. The delay from this cause, however, would be very short, as the water in the river would run down in a few hours.

Bullion Shipments.

Ontario, Feb. 20th, \$23,254; Hanauer, Feb. 22d, \$9,800; Crescent, Feb. 22d, \$3,500; Horn Silver, Feb. 22d, \$6,000; Ontario, Feb. 22d, \$9,624; Hanauer, Feb. 24th, \$4,800; Horn Silver, Feb. 24th, \$6,000; Ontario, Feb. 24th, \$4,368; Syndicate, Feb. 23d, \$6,995; Bonanza King, Feb. 25th, \$9,707; Navajo, Feb. 24th, \$5,000; Bodie, Feb. 20th, \$32,682; Standard, Feb. 23d, \$13,817; Bonanza King, Feb. 26th, \$9,195.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARRO G. HOAG—California.
B. W. CROWELL—Nevada.
L. M. LEMAY—San Bernardino and San Diego counties.
J. J. BARRELL—Sacramento county.
C. E. CURTIS—Kern and Fresno counties.
C. S. DENNIS—San Mateo county.
A. C. KNOX—Chama, Yuba and Yolo counties.
F. M. THOMAS—Fresno county.
ED. MACK—Santa Clara county.

Lost Papers.

If any subscriber fails to receive this paper promptly, after making due inquiries at the Postoffice, he is urgently requested to notify this office by letter, that we may send the missing papers, and, if possible, guard against further irregularities.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walked with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNAL.

New Book on Assaying Gold & Silver Ores.

BY C. H. AARON.

For Practical Workers. \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, "renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 1/2 pages, with illustrations, well bound in cloth. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market Street, San Francisco.

N. B. This is Part I of three volumes on assaying by

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

[ESTABLISHED, 1809.]

A. LUCKHARDT.

B. SALAZAR.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.
C. A. LUCKHARDT & CO.,

Mining Engineers and Metallurgists.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials,
MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG-
GISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17
California St., San Francisco.

We would call the attention of Assayers, Chemists,
Mining Companies, Milling Companies, Prospectors, etc.,
to our full stock of Balances, Furnaces, Muffles, Crucibles,
Scorifiers, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast, we feel
confident from our experience we can well suit the de-
mand for these goods, both as to quality and price. Our
New Illustrated Catalogue, with prices, will be sent on
application.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes,
will be sent free upon application. Agents for the Patent
Plantago Crucible Co., London, England.

National beat Rand.....	139	" "

IMPROVED FORM

—OF—

HYDRAULIC GIANT

We call the attention of those using or interested in Hydraulic Mining Machinery to the
above cut of an improved form of Hydraulic Giant, in which it will be observed that the De-
flector and heavy weighting rear part are abolished and a lever attachment, working with a
ratchet and pawl substituted, by which the pipeman, standing in the rear of the machine, has,
without danger of "bucking," full control of the direction and effect of the stream. In an action
in the U. S. Circuit Court, entitled F. H. Fisher and Joshua Hendy vs. Richard Hoskins et al.
of the Marysville Foundry, a permanent injunction has recently been ordered against all persons
manufacturing or using any form of Hydraulic Machine having the equivalents of the above.
All of the usual sizes are manufactured (under an exclusive right) and for sale at reduced
prices by JOSHUA HENDY, at the

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE
ever invented for the service of Prospectors and
others requiring the use of a Horse Power, possessing all
the requirements of a first-class hoist and affording means
for the continuous operation of a Pump or Blower without
interfering with a hoisting apparatus.

It is made entirely of Iron; no piece weighs
over 250 pounds. At the ordinary speed of a horse a
1,000-pound bucket of ore may be raised 120 feet per
minute. The hoisting drum is under the complete control
of the man at the shaft, and is capable of carrying 500
feet of five-eighths steel rope. The cost of erection is
slight, as two men in half a day can easily put it in place
ready for work.

While this power is more particularly for mining pur-
poses, it is equally adapted to all other uses where animal
power is required. SEND FOR CIRCULAR.

MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

CHICAGO FRASER & CHALMERS. ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns.

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Statefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Statefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. Baby Hoists for Prospecting, 4 H. P. to 6 H. P.

Wire Rope, Safety Cages and any Size and Forms of Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail. HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. Of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

McCaskell's Patent Car Wheels and Axles—Best in Use.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

Our Home Industries.

(CONCLUDED FROM PAGE 160.)

the country increased 59 per cent, the added or industrial value of manufactured goods increased 130 per cent.

The Tariff.

It was on March 2, 1861, that the Morrill Tariff Bill became a law, going into effect 1st of April, same year; this bill cannot therefore be said, in any sense, to have been a war measure, but it was the beginning of the policy of charging import duties on foreign-made goods, to create a revenue and to protect home manufacturing. Imperfect as that tariff bill was, as all such tariff bills must necessarily be, the effect has been to call into active life innumerable industries, and to give employment to such a vast army of skilled workmen, with the result of such great wealth and power to the country at large, as is shown by the figures I have read to-night. Some of the industries thus created may be able to stand a partial withdrawal of that protection, but this must be done with the utmost care and caution.

Horticulturists sometimes take certain plants that are raised in a hot-house, and gradually expose them to a lower temperature until they are able to live in the open air, but this is an experiment very often resulting in death to the plant, after a struggling and painful existence during the process of hardening.

Last year the tariff was reduced and readjusted, and many of the industries, notably the iron interest, are suffering to-day from that cause; and now Representative Morrison comes in with an "Act to Reduce Import Duties and War Tariff," by which he proposes to make a general reduction of 20 per cent; the effect of such a sweeping reduction cannot fail to be disastrous. I beg, therefore, to call your attention to the proposed bill, which has already been referred to the Committee on Ways and Means in the House.

I wish only to add that all matters affecting the manufacturing interests of California in particular should be your special care if we expect to keep this State in a prosperous condition. Let us be in earnest in our efforts to provide employment for her mechanics and workmen, at remunerative wages. Let us offer the open hand of fellowship to all who start new or duplicate old industries in this State. We do not propose to be any man's or any firm's champion, but to champion the industrial interests of the State at large, and to do our utmost to build up a prosperous, industrious, law-abiding people in this young, glorious and free State of California.

BY-LAWS

Of the Manufacturers' Association of California.

The following is a complete copy of the By-Laws of the Manufacturers' Association of California, and all amendments, including that adopted at the meeting held last week:

1. The corporate name and title of this Association shall be the Manufacturers' Association of California.
2. The principal place of business of the Association shall be in the City and County of San Francisco, in the State of California.
3. The designs and objects of this Association shall be the fostering, encouraging, developing and protecting of the home industries and the manufacturing interests of the State of California and especially of the members of this Association.
4. The term of existence of this Association shall be fifty years from and after the filing of the Certificate of Incorporation.
5. The affairs of this Association shall be managed by a Board of eleven Directors, who shall be residents of the State of California, and who shall be elected annually, by the members in person voting by ballot on the first Monday in November in each year.
6. Immediately after the result of the election shall have been declared, the Directors shall organize by electing from their members a President, a Vice-President and Treasurer.
7. As soon as organized, the Board of Directors may elect such other officers and employees as the business of the Association may require.
8. The duties of each officer of the Association are such as pertain or attach by law or custom to the office.
9. The Association shall have a seal, the device being a circle with the words "Manufacturers' Association of California," surrounding the words: "Incorporated November 13th, 1883."
10. All vacancies in the Board of Directors occurring between the annual elections, shall be filled by a majority of the remaining members of the Board.
11. The Board of Directors shall at their first meeting and as often thereafter as they may deem it necessary, require and exact from the Secretary and Treasurer, or from any other officer of the Association, when they so decide, bonds for the faithful performance of their duties. The amount of said bonds shall be fixed by them, and lowered or increased at any time as in their judgment they may deem advisable or proper.
12. The members of this Association shall be those who are actually engaged in manufacturing in the State of California.
13. All persons or firms engaged in manufacturing business within the State of California, are eligible to become members of this Association. (Amendment Adopted, February 21, 1884.)
14. Whenever a member ceases to be a manufacturer or identified with manufacturing, his membership shall cease and shall be so declared by the Board of Directors.
15. Persons otherwise eligible may become life members of this Association on complying with Arti-

cle 17, and by the payment of two hundred and fifty dollars. After election shall be exempt from the operations of Articles 12, 13 and 14.

16. The Association may elect honorary members from among those who have been active member of this Association, and who may have retired from business, or from distinguished persons who have been prominently identified with the manufacturing interests of the country, with all the privileges of the Association except the right to vote or hold office.

17. All applicants for membership must sign these By-Laws, pay the fees and dues, and be approved by the Board of Directors before they can be admitted to this Association as members. Two negative votes in the Board of Directors shall be equivalent to a rejection of the applicant.

18. The membership dues shall be as follows: Entrance fee, twenty dollars, payable on admission, and twenty dollars per annum, payable in quarterly installments of five dollars, to be paid in advance on the first day of November, February, May and August of each year.

19. Failure to pay quarterly dues for six months shall entail forfeiture of membership.

20. All entrance fees and life membership subscriptions shall be set aside as a Building Fund, and invested in safe securities, yielding not less than four per cent per annum, until the Association shall have erected and paid for a building adapted to its requirements.

21. The Board of Directors shall meet monthly at such day and hour as it shall determine.

22. There shall be an annual meeting of the Association on the second Monday of November, when the final condition of the Association shall be exhibited; the reports of the officers and address of the President shall be read.

23. Five days' notice by letter through the post-office addressed to each member shall be given of any meeting of the Association.

24. The voluntary absence of any Director from three consecutive regular meetings of the Board, shall be equivalent to a tender of his resignation as a Director.

25. Special Meetings of the Board of Directors or of the Association, may be called at any time by the President.

26. The President shall call a Special Meeting of the Association on the written request of ten members.

27. At all meetings of the Association fifteen members shall constitute a quorum.

28. These By-Laws may be amended by a two-thirds vote of the members present, at a meeting of the Association called for that purpose; notice and copy of the proposed amendments having been mailed to each member and posted in a conspicuous position in the rooms of the Association at least one month previous to such meeting, and it shall be the duty of the Secretary to carry out the provisions of this Article.

The Board of Directors of the association is as follows: A. S. Hallide, President; I. M. Scott, Vice-President; N. W. Spaulding, Treasurer; George C. Hickox, Secretary; W. T. Garratt, A. Haraszthy, Wm. Harney, D. Kerr, S. P. Taylor, A. Tubbs, A. H. Phelps, I. Hecht, Executive Committee—W. T. Garratt, A. H. Phelps, A. Haraszthy, Finance Committee—I. Hecht, D. Kerr, Wm. Harney.

The Board of Directors of the Association have recently appointed as permanent Secretary Mr. George C. Hickox, a gentleman well known in this community as banker, broker and expert business man. Mr. Hickox has an enviable reputation as an energetic, pushing man, who puts his whole soul into any work he undertakes. It is part of his duty to collect statistics and information for the benefit of the manufacturers belonging to the Association, and he will make an energetic canvass and get all the manufacturers to join the organization.

THE GOLD RUN MINING CASE.—The case of California vs. the Gold Run Mining Company, is being argued before the Supreme Court. The action was brought by the Attorney-General of the State in June, 1881, against the Gold Run Mining Company of Placer county, alleging that the defendants and other companies, engaged in hydraulic mining, were filling the Sacramento river, and thereby committing a public nuisance; and also that private property had been destroyed in the past, and would be jeopardized in the future. The defendants denied the allegations in detail, and said that, having acquired their property by purchase from the United States and operated it for a long period of years by the method complained of, they had a sanction from the United States government, and by various statutes and decisions of the Legislature and courts of the State, that it constituted a license. The case was heard before Judge Temple at Sacramento, November 18, 1881, and occupied until March, 1882. On June 12, 1882, Judge Temple rendered his decision, which has been known in this litigation as the "Temple decision." The appeal to the Supreme Court was mutual with the principals in the suit, the miners not being satisfied with the part of the decision relating to the construction of the dam, and the Anti-Debris Association not agreeing with the court in its giving the miners permission to work.

MR. HORATIO C. BURCHARD has been re-appointed Director of U. S. Mints. This appointment signifies an end of the dispute as to affairs in the Mint at San Francisco, which arose over the disagreements between Burchard and Superintendent Charles H. Burton.

THERE will be railroad connection with the City of Mexico in about three weeks.

PATENTS AND INVENTIONS.

 3,297.—LABEL—Wells & Church, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REFRIGERATING CAR AND APPARATUS FOR SHIPPING MEAT.—Henry G. Widman, S. F., Cal. No. 293,832. Dated Feb. 19, 1884. This invention relates to a new and useful improvement in transporting or shipping meat from the slaughter-house to the market. The practice has been usually, after slaughtering the animals, to quarter them and pack them into cars. This practice was designed to overcome the undesirable features of transporting live animals; but to the present practice of transporting "quarters" there are also objections, principally lying in the appearance of the meat upon arriving at its destination. When quartered but he flanks shrink and spoil in shape, and the meat does not look clean and healthy as when first slaughtered. Again, it needs handling, and when packed is apt to heat. Mr. Widman's invention is designed to overcome these difficulties by enabling him, after slaughtering the animals and dressing them while hanging on the gambrels, to run the carcasses entire into the car, and transport them still in a suspended condition to the market, where they arrive in good condition, just as they were slaughtered. The invention consists therefore in the improvement in shipping meat from the slaughter-house to market, consisting in packing carcasses entire in the car. It further consists in the means which enable the inventor to accomplish this result to the best advantage—namely, in getting as many as possible into the car, thus utilizing its full capacity, and in doing this without handling the meat.

PORTABLE RAILWAY FOR LOGGING PURPOSES.—John Dolbeer, S. F. No. 293,853. Dated Feb. 19, 1884. This improved construction of railways consists of stringers with transverse timbers framed into them to hold them together, and having rails bolted to them to form complete sections in straight lines and curves, and their ends so formed that any of the sections may be abutted and secured together to form a continuous line of railway with regular or reversed curves at any desired points. This railway is specially designed to be used in rough, mountainous and wooded land where it is desirable to get out logs for milling purposes. In such localities it is customary to build roads over which the logs may be hauled upon wagons and trucks; or what are known as skid-roads are built by laying logs transversely at intervals of four to eight feet, so that the log can be drawn across these fixed skids. Both of these roads are comparatively expensive for the short time they are needed, and new ones must be built whenever the timber in any locality is exhausted. This new railway is formed in solid sections with all necessary curves, suitable to be laid on the ground, with only the work of partial leveling and without any gravel or complete filling or grading so that logging engines and cars

may be run over it into any locality, and when the timber is exhausted, the sections may be taken up by a derrick upon a car and transported to another point and re-laid complete.

CAR COUPLING.—John Martin, Knights Ferry, Stanislaus Co., Cal. No. 293,899. Dated Feb. 19, 1884. This is an improvement in that class of car couplings in which swinging latches on each draw-head are adapted to fall into engagement with the ends or beads of the coupling pin. The invention consists in a peculiarly constructed draw-head chamber, in a staple secured to the under side of the gravitating latch, adapted to receive and throw out the coupling pin when necessary, and in the means for raising the latches from above or on the side to uncouple the cars. The object of the invention is to provide a simple and effective automatic car coupling which shall be able to readily uncouple itself in case of accident, or be easily uncoupled by design.

FRUIT CUTTER AND PITTER.—Chas. Allison, S. F. No. 293,841. Dated Feb. 19, 1884. This invention consists in opposing V-shaped knives, inclosing a space for the reception of the fruit, and adapted to cut the meat to the pit, a thimble or band in the angle of each cutting edge for retaining the pit, and a flexible line for wrapping around each half of the fruit and cutting it from the pit. The machine, while applicable, for any kind of fruit having pits or stones, is particularly designed for use in preparing peaches, and more especially "clingstones," in which the meat adheres to the stone so tenaciously that it is difficult to release it.

The Lien Lands.

WASHINGTON, February 26th.—The Lien Land bill was reached in regular order on the calendar of the Senate to-day, and, after a debate of a few minutes, was amended and passed. The bill recently introduced by Senator Miller was not considered, and the substitute for Senator Farley's bill, introduced December 18, 1881, was passed in its place. The substitute was originally prepared by Senator Van Wyck, and was reported to the Senate on March 21, 1882. Senator Plumb, of Kansas, pressed it to-day as a substitute for the Miller-Glasscock bill. As passed by the Senate to-day, the bill reads as follows:

That an Act entitled "an Act to provide for the survey of public lands in California, the granting of pre-emption rights therein and other purposes," approved March 3, 1853, was intended to give to the State of California the right to select for school purposes other lands in lieu of such sixteenth and thirty-sixth sections as may have been or shall be found to be mineral lands, provided that such indemnity selections shall be made under the limitations contained in said Act from surveyed public lands of the United States in the State of California, subject to entry under the general laws, and not mineral nor occupied by actual settlers, nor reserved for any purpose, nor appropriated under any law of the United States.

The bill was sent to the House this afternoon. It will be considered by the Public Lands Committee before the House will act on it.

News in Brief.

SACRAMENTO has four hundred saloons.

THE Harper High License law of Chicago has been declared constitutional by the Supreme Court of that State.

THE Governor of Michigan gives petitions for pardons full publicity before he takes any other action in regard to them.

ORDERS have been received at Mare Island Navy Yard to fit out the schooner Ounalaska for further explorations of Alaska.

THE widow of A. T. Stewart sold the Stewart building on Broadway and Chamber street, New York, to Judge Hilton, for \$2,100,000.

THE British House of Lords has passed the bill for the better prevention of the introduction of foot and mouth disease by foreign cattle.

THERE are indications that Congress will refuse to make appropriations for printing \$1 and \$2 greenbacks. This course will be for the purpose of forcing silver dollars into circulation.

THE Visalia Delta estimates that 30,000 acres of virgin soil will this year be sown to grain in the country irrigated by the Seventy-six canal, which will yield at a low calculation, 300,000 sacks of wheat.

COL. A. ANDREWS, of this city, has been appointed by President Arthur as Representative for California at the World's Industrial and Cotton Exposition, to open in New Orleans in December next.

SARCENT is the object of much sympathy on the part of members of the German Chamber of Deputies and other persons of note, who express disapproval of the attacks made upon him by the conservative press.

THE Fire Underwriters of the Pacific coast have resolved not to grant, in any policy they may hereafter issue, permission for keeping fireworks, fire-crackers or explosive bombs in any place where they accept insurance.

A LONDON dispatch says: The wine merchants are badly off, owing to the decrease in the consumption of all wines except claret and champagne, but the whisky trade flourishes. A Scotch train the other day consisted of 24 cars laden entirely with whisky.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

ASSESSMENT NOTICE.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador county, near Drytown, California.

NOTICE is hereby given, that at a meeting of the Directors, held on the 29th day of January, 1884, an assessment (No. 44) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 12th day of March, 1884, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 10th day of April, 1884, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHBY, Secretary.

OFFICE—No. 402 Front Street, Room 8, San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

San Francisco, February 2, 1884.

At a meeting of the Board of Directors of the above named company held this day, Dividend No. 64, of twenty-five cents (25c.) per share, was declared, payable on TUESDAY, February 12, 1884, at the office in this city, or at the Farmers' Loan and Trust Company, in New York.

WILLIAM WILLIS, Secretary.

OFFICE—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, Cal.

GIANT POWDER

MANUFACTURED UNDER ALFRED NOBLE'S Original and only valid Patents for NITRO-GLYCERINE. RING Powders, which has been and still is of such immense advantages to the Miner, Railroad Man and the Engineer. All other Nitro-Glycerine Compounds are simply imitations and adulterations of the Original Giant Powder. The Giant Powder Company manufacture three grades of Powder, which are the Safest and Strongest High Explosives in the market. The Original Nitro-Glycerine Compound, GIANT POWDER or DYNAMITE, is acknowledged by all the great chemists of the world as unapproached by any other compound. The Giant Powder Company have acquired the exclusive right to manufacture "NOBLE'S EXPLOSIVE GELATINE," which contains 96 per cent. of Nitro-Glycerine. It is still stronger than Dynamite, and even safer in handling. This explosive was used in constructing the Mont Cenis Tunnel. THE JUDSON POWDER is a black Powder owned and manufactured by the Giant Powder Company; it is from three to five times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it Breaks More Ground, Pulverizes Better, and Saves Time and Money. The only difficulty heretofore experienced by some consumers of this Powder has been that it required more time to get it to the bottom of a deep borehole. This has now been entirely overcome, and our JUDSON IMPROVED is now as dry as the ordinary Blasting Powder and runs as freely.

Triple, Quadruple and Quintuple Caps and all grades of Fuse for Sale.

Economy in space and fuel. Safety at high
pressures. Freedom from scaling. Equally
adapted for power and heating purposes.
Especially adapted for mills, factories, hotels,
stores or any place where safety is a necessity.
Will work well with muddy water and any kind
of fuel.

TESTIMONIALS.

ST. LOUIS, Mo., Sept. 25, 1883

Messrs. Adolphus Meyer & Co. GENTLEMEN:
We cheerfully certify that the "Heine Patent
Safety Boiler" put up by you in our establish-
ment has proved very satisfactory in its working.
The chief points of excellence in the "Heine
Safety Boiler" are its economy in fuel and space,
freedom from scaling, aptitude for power and
heating purposes, working equally well with clear
and muddy water. We warmly recommend it to
all using steam machinery. Yours truly,

ANHEUSER BUSCH BREWING ASSN.

OFFICE OF Supt. of Royal Railways,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer. In reply to
your inquiry of September 24, we respectfully in-
form you that the three boilers built under your
patents, under steam since September 25, 1881, at the Alex-
ander Platz Depot, as well as the two at Friedrich Strasse
Depot, under steam since September 22, 1882, have given
good satisfaction, requiring no repairs whatsoever to date.
The internal cleaning of the boiler was always accomplished

with ease on account of the convenient arrangement of the
tube caps, the adhesion of scales being fully prevented
thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted

on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is now and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That is this understood and appreciated is evidenced by the number of patents issued through their Scientific Patent Agency (S. P.) from week to week and year to year.

Abandonment of Mining Claims.

Not long since some miners who made application to the U. S. Land Office for a patent on a certain mine had their application rejected because they did not "furnish positive and complete proof of the abandonment of a lode." It seems that the original location certificate, in giving the boundaries of their lode, said "the boundaries of this lode include a portion of the surface of an abandoned lode known as the Sampson." In answer to a request made to the Commissioner of the Land Office, by the miners, as to why he required this proof of abandonment, the Commissioner states that "it has long been the practice of this office, where entry of a mining claim is based upon a relocation of an alleged abandoned mineral claim, to require full, positive and complete proof in regard to abandonment of the prior location."

Section 2325 of the Revised Statutes prescribes the manner in which a patent may be obtained "for any land claimed and located for valuable deposits." After setting forth minutely the acts necessary to be done, the section closes with this language: "If no adverse claim shall have been filed with the Register and Receiver of the proper land office at the expiration of the sixty days of publication, it shall be assumed that the applicant is entitled to a patent, upon the payment to the proper officer of five dollars per acre, and that no adverse claim exists; and thereafter no objection from third parties to the issuance of a patent shall be heard, except it be shown that the applicant has failed to comply with the terms of this chapter." No adverse claim was filed in this case. The matter was appealed, and the Secretary of the Interior says there is no provision of the Statute which requires the proof called for by the land office. A claimant of the Sampson Lode could not be heard to require such proof, nor could any third parties object "to the issuance of a patent" without it. The question of abandonment would be a very proper one to try in the court under the provisions of section 2326, if an adverse claim was made.

The Secretary uses the following forcible language in his letter to the Commissioner of the land office, reversing the first decision: "The practice of your office in this respect seems to go beyond the law, and requires proof in a manner not contemplated by the statute. The claimant of the Sampson Lode, if there be any such claimant, had full opportunity to test the fact of abandonment, if he desired to do so, by filing an adverse claim for that part of the surface embraced in the boundaries of the Edith. If he failed to make the claim, I do not think it proper for your office to put the applicants for patent to the trouble and expense of proving an abandonment which they alleged in their notice of location, and which should be held to be admitted by failure to file an adverse claim; and especially should this be so under a statute which declares that if no adverse claim is filed "it shall be assumed * * * that no adverse claim exists."

MONTREAL claims to have made about \$1,000,000 by her ice-carnival.

Mine Timbers.

No systematic attempts have been made in this country to prevent the rapid decay of mine timber by preservative or water-proofing material applied to the lumber before it is placed underground, but in England, Germany and France such experiments have been made with very satisfactory results.

The life of new timbers varies between extremely wide limits. In some of the mines of Continental Europe timber is still standing in a good state of preservation, apparently unchanged since it was placed in position one or two centuries ago, and in some of the anthracite mines of Pennsylvania timber thirty years old is still in a fair state of preservation, but this is the exception, not the rule. As a rule, the life of mine timber in anthracite regions is limited to a few years at least, and at some collieries the average life of timber has been estimated at less than one year.

Several causes contribute to hasten the decay

THE SKINNER & WOOD STATIONARY ENGINE.

of timber in anthracite collieries, prominent among which are warm, damp air, dripping water, running or standing acid water, the presence of air containing gases, and the changes from wet to dry condition of the mines following corresponding changes in the weather.

Academy of Science.

A regular meeting of the Academy was held on Monday evening last, President Davidson in the chair. Among the donations to the museum were samples of mud, dust and pumice which fell on the deck of the ship *Charles Ball*, which was within eleven miles of the volcanic island of Krakatoa at the time of its terrific eruption, last August. Mr. Ball presented some pieces of a hard substance, like rock which had been extracted from the jaw of a horse. Dr. Pebl read a paper on "Sexual Evolution in Botany." Mr. Robert E. C. Stearns spoke of the variations of molluscan forms, exhibited when extensive distribution is brought into consideration. The President read papers by C. B. Hill and Charles Buckwalter, describing a transit of the fourth satellite of Jupiter.

Mr. WHITE, agent of the Atchison, Topeka and Santa Fe railroad, states that the Mexican Central railroad will probably be opened by the 15th inst., and that there will then be a continuous line through to the City of Mexico.

An Improved Stationary Engine.

The accompanying engraving shows the Skinner & Wood stationary engine. It is complete, with automatic stop governor, pump and heater, and requires no lining up. The aim has been to make them easy to manage, strong and durable. It will be seen that they differ in principle from the ordinary type of engines or box-frame pattern, inasmuch as the frame supporting the working part of the engine is placed in a direct line with the center of the cylinder and crank shaft (known as the straight line principle), and is but another adaptation of the well known "Corliss" girder frame, which has been found to be the best form to successfully withstand the great force exerted on pistons of automatic engines; in using a center crank the makers are enabled to employ this principle to still greater advantage by making the frame double, and giving two bearings to resist the strain instead of putting it all on one, as in the case of the side crank engine. In this way they obtain

increased efficiency, and build an engine which is self-contained; really requiring no bed, though one is used merely to give a better foundation and to provide a receptacle for the drip. This frame is best adapted also to the requirements of strength.

The difference between the Skinner & Wood frame and the box frame in point of strength can be illustrated by the experiment of trying to pull a stick in two ends, or of breaking it over the knee; in other words, the metal is put where it will do the most good.

Center-crank engines have advantages over the side-connected engines, as they require less expensive foundations; can be placed in position and put in operation by anyone; while with the latter, the services of a skilled mechanic are needed to put the shaft in line and to keep it there, as the out-board pillow-block is placed on a separate foundation, and any setting or shifting will throw shaft out of line; again, with the style illustrated, no care need be taken to order "right or left hand engines," as the engine can be belted from either or both sides of the shaft as desired. These engines are in use at the elevators of Minnesota, Dakota, Iowa and Nebraska; in the cotton gins and small mills of Texas, and at planing mills, machine shops, printing offices, etc., throughout the United States. The Stearns Manufacturing Co., whose branch house on this coast is at 21 and 23 Main street, in this city, are

New Technical Society.

Several attempts have been made in this city to form a society of mining engineers, but they have been unsuccessful. It has been attempted also to maintain one composed of mechanical engineers, but this, too, failed. We have here scientific, microscopical and geographical societies, and a manufacturers' association for attending to the business wants of manufacturers, but there is no society such as exists in almost every large city for the interchange of ideas among engineers. That there is room for one here admits of no doubt, but so far, as has been stated, the scope of those proposed has been too limited to achieve success. One is now being formed which will embrace military, mechanical, mining, gas, electrical, sanitary engineers, architects, assayers, metallurgists, chemists and manufacturers.

The objects of this society will be the professional improvement of its members, the encouragement of social intercourse among men of practical science, the advancement of the technical profession in all its branches, and the establishment of a central point of reference and union for its members. Among the means to attain these ends shall be periodical meetings of the society, where questions concerning the entire profession will be discussed and acted upon. The special interests of the separate branches will be taken care of by a club, embracing only members of that particular branch, which club, however, will always remain a subordinate section of the general society. The proceedings will be published. It is believed that a society as above outlined will tend to give the members of the profession the standing they deserve. A committee is now drafting a constitution and by-

laws, which will be submitted to a general meeting for discussion and adoption, to be called as soon as the committee has finished its work. Time and place of such meeting will be duly announced. The call for the formation of the society has been signed by the following gentlemen: Geo. F. Allardt, C. E.; H. C. Behr, Mech. E.; Ross Browne, M. & C. E.; Aug. J. Bowie, Jr., M. E.; A. Craven, C. E.; R. Fennor, Mech. E.; San Francisco Gas-light Co.; J. Hagemaier, Mech. E.; A. D. Hodges, Jr., M. E.; Ch. F. Hoffman, M. & C. E.; J. E. Henkenins, C. E.; U. S. Surveyor-General's Office: Fr. H. Jensen, Chemist G. P. Co.; M. Manson, C. E., Chief Engineer Harbor Commission; George Parly, patent lawyer; W. Schroll, architect; Geo. J. Specht, C. E.; F. Von Leicht, C. E.; H. P. Vincent, C. E.; and L. E. Wyneken, architect.

The report of the officers of the Mechanics' Institute on the eighteenth industrial exhibition held in this city last fall has been issued. It contains the programme and review of the opening exercises, a list of premiums awarded and the reports of the various committees, besides other data interesting to exhibitors and others. The management states that a few of the diplomas are as yet uncalled for, and persons to whom they were awarded are requested to call at or send their address to the Institute Library on Post street.

CORRESPONDENCE.

We admit, unenclosed, opinions of correspondents. Eds.

White River Mines.

EDITORS PRESS:—The continuous and heavy downpour of rain for the past few weeks has greatly retarded mining operations in this camp, but nobody is grumbling, the rain being welcome to all.

The Bald Mountain Company is still pushing with two shifts the west level of its mine. From mouth of tunnel to vein is 1,600 feet. From end of tunnel to the end of west level at present is about 850 feet. Since cutting through the Doc. George chute, which this tunnel was specially intended to develop, this level has revealed only barren ground. This long, narrow, crooked level, skimming along under the grass roots, is very well calculated both to deplete its owners' pockets and to give the camp a black eye. If Messrs. Cook & Doyle care to succeed in this mining venture they will go back to the chute, cut through, and go down on it.

Mr. Spier, on the Old Grizzly mine, has suspended work, pending the expected arrival of his partner, who resides in San Francisco. He thinks he will shortly resume work, putting on two shifts.

It is understood here that some moneyed party is negotiating with Mr. Frank Cunningham for the purchase of some of his mines which are situated in the Slate range. As Mr. Cunningham is the owner of several large, well defined ledges, which prospect well, we hope he may induce capital to take hold of them—the more the better.

Mr. G. W. Brown, of San Francisco, has been here for the last two weeks trying to get the work of developing his mines started. Despite the inclemency of the weather he has a half dozen men employed, getting things in shape to put on a large force. Mr. Brown has purchased the Stancel and Redfield mines, and proposes to put down a shaft on the Redfield five or six hundred feet. The Redfield is a large vein of what we here call low grade ore—from \$12 to \$15 per ton—but increasing in size and richness as depth is attained. Mr. Brown intends to take it out by the roots.

Mr. D. B. James, acting in the interests of San Francisco parties, has for the past six or seven weeks had from six to ten men employed in re-opening the old Josephine mine, and in constructing a wagon road from the mines to the mill on the river. The Josephine is in a slate formation, which very much resembles that in which the Hite ledge occurs in Mariposa county, and although its workings have reached only the shallow depth of one hundred feet, the ore was so marvelously rich that it has produced nearly a quarter of a million dollars. Like many other good producing mines when worked in this camp, the Josephine has lain idle a long time, but now that its rest is broken it will be heard from again. I examined this mine to-day and found everything in good working shape. At the bottom of the main shaft the walls are filled with solid quartz, exactly five feet thick—a big ledge for this camp. From the bottom of the shaft a level has been started west and is now out thirty feet. From the shaft to the end of this level the ledge gradually decreases to about fifteen inches in width, but with indications of thickening again. The quartz in the big bulge will pay about \$15 per ton. At the end of the thirty foot level it will pay \$30 per ton—free gold. In addition to this free gold, the whole of this vast body of ore is a glittering mass of rich sulphurets. There is already enough on the dump, which, when milled will pay all the expense of reopening the mine to this State.

So my news items have related only to organized companies. There are many mines here owned by individuals, and worked in a small way with very good results, but as this communication is already sufficiently lengthy I must defer particular mention of them until another week.

H. J. KELLER.

White River, Tulare Co., Cal. Feb. 26th.

GOLD-SAVING MACHINE.—James H. Campbell, of San Francisco, and Joseph R. K. Irwin, of Portland, Oregon, arrived here Monday, bringing a machine with which they claim excellent results can be attained in saving the fine gold that ordinarily runs off into the streams with the tailings from quartz mines. They have set up the machine at the mill of the Merrifield mine, and are now engaged in demonstrating its efficiency.—*Nevada Transcript*.

AN ORE-REDUCING CONTRACT.—The Battle Mountain Messenger understands that a contract is about completed between the Dahlgren Mining Company, of Lewis, and D. P. Pierce, to reduce 200,000 tons of ore from the Dahlgren mine. Mr. Pierce, the Messenger says, has leased the Highland Chief 40-stamp mill to crush the ore, and will put it in running order by March 1st.

DUN GLEN.—G. McMillan, Superintendent of the Laug Syue mine, at Dun Glen, reports the mine and mill running steadily and producing bullion in paying quantities. It has been hard work to keep the mill going and the roads open during the recent bad weather.

Experiments on American Woods.

The following paper was read by Prof. S. P. Sharples, of Boston, Mass., before the American Institute of Mining Engineers:

Under the act providing for the taking of the tenth census, the Superintendent was authorized to appoint experts to inquire into special industries. Under this act Professor Charles Sargent was appointed to gather statistics in relation to the forest industries.

As chief of the Department of Forestry of the tenth census he has been busily engaged in this work since the fall of 1869. Soon after his appointment he became convinced that it would be desirable to make an examination of the fuel value of the various woods of the United States, and this work was placed in my hands.

At the same time I made the suggestion that while we had the opportunity it would be well to test also the strength of these woods. The suggestion was adopted, and Professor Sargent at once set his agents to work in various parts of the country to collect specimens of all the trees growing in their localities, employing, as a rule, botanists who were familiar with the flora of the region in which they were at work. The result of this work was the collection of over thirteen hundred specimens of wood, comprising over four hundred species and varieties, nearly one hundred of which had not before been described as trees existing in the United States.

The Ash and Specific Gravity

Of every specimen in this collection has been determined in most cases in duplicate. About 2,600 ash and 2,800 specific gravities having been determined, about 325 species were further tested for transverse strength and resistance to crushing. In this series about 1,800 specimens were tested. As each of these was tested in three different ways, it made in all about 3,900 tests. The specific gravity of each specimen in this last series was also determined, thus making in all about 10,600 tests that were made on the specimens. Many of these tests, however, included not only a single test, but often a series of tests that required at least ten entries on the final report, as I shall explain further in this paper.

In addition to the tests already spoken of, 70 tests were of the carbon and hydrogen in a number of specimens.

These tests have already, so far as the results of the ash and specific gravity of the dry wood is concerned, been published in *Forestry Bulletin* No. 22. The carbon and hydrogen determinations are to be found in *Bulletin* No. 18, while the tannin in the bark of a few of the most promising trees is found in *Bulletin* No. 24.

A *Bulletin* shortly to be published is to give the deflections under various loads of the woods tested in this manner, and the weight under which they failed, together with the force necessary to crush in the direction of the fiber pieces, whose length was equal to eight diameters. In addition to the tables published in the *Bulletins*, the final report will give the force necessary to indent the wood.

This series of tests is felt to be incomplete in many ways, and with the experience that has been gained in the work could doubtless be improved. A brief description of the methods used may be of interest.

Each specimen as soon as received was given a number, and this number has been constantly repeated in all the work done on that specimen; it is designated in the reports as the office number, and wherever met with always refers to the same tree.

After numbering, the sticks were at once sawed into bars five centimeters square. These pieces were then seasoned by air-drying. During the first winter they were kept in a room warmed by a stove to about 70° F. After that they were removed to a timber loft at Watertown Arsenal, where they were kept until they were dressed for the final tests.

Two Blocks of Fifteen Centimeters

In length were taken from each specimen and dried rapidly with steam heat until they had lost most of their moisture. From these pieces, blocks of exactly 11 centimeters in length and about 35 millimeters square were dressed out. These were then placed in an oven which was maintained at a constant temperature of 100 until the blocks were perfectly dry. After they had ceased to lose weight, they were carefully measured with a micrometer caliper and then weighed. From the measurement and weight it was easy to calculate the specific gravity.

The ends removed from these blocks were used for determining the ash. They weighed from 10 to 20 grams and thus gave quite appreciable amounts of ashes. The ash was determined by drying the wood in the same manner as the specific gravity blocks, then carefully burning in a platinum dish in a muffle-furnace heated by gas. The heat was so regulated as to burn the ash perfectly white without melting it. In most cases the ash was left in the exact shape that it occupied in the wood. It was judged best to report the ash exactly as found, and not to attempt to make any correction, on account of carbon dioxide that might have been lost from the calcic carbonate present. From these results, the

Approximate Fuel-Value

Was calculated, assuming that equal weights of

all woods have the same fuel-value. This value is supposed to be given more correctly by taking as the weight of the wood, not the specific gravity, but the weight of a cubic decimeter, minus the ash contained in it. The ash evidently adds nothing to the fuel-value, while it does add to the weight. This assumption, which is the one which is generally made, is not strictly true, but it is near enough for all practical purposes. It is founded on experiments made by Count Rumford and Marcus Bull.

The carbon and hydrogen determinations were made by burning fine sawdust in a platinum boat in a current of oxygen and collecting the products in the usual way. These analyses were calculated on the dry wood. The determinations may be conveniently divided into two classes—those of the coniferous woods and the non-coniferous.

The Coniferous Woods

Examined, with two exceptions, gave larger amounts of carbon than the hard woods. These two exceptions were the common white cedar or *arbor vitæ* of the north, and the black spruce or *pecca alba*, neither of which would be selected as valuable fuel. The average composition of twenty-nine specimens of coniferous woods examined was: Carbon 53.21; hydrogen, 6.45; ash, .32; specific gravity, .5624. Fuel-value by weight, 4488.3; by volume, 2524.2.

For the non-coniferous woods the average results were: Carbon 49.53; hydrogen, 6.33; ash, .66; specific gravity, .6951. Fuel values by weight, 3993.9; by volume, 2776.1. These latter values agree very closely with those given in the books, as the results of the analyses of European woods. It is rather singular that with the exception of fir, no coniferous woods have been reported on in Europe.

Forty-one determinations of non-coniferous woods were made. After the long sticks of wood have become thoroughly seasoned, they were dressed out to the exact size of four centimeters square, and were sawed as near as possible to the length of 11 decimeters. They were then tested on the Watertown machine. In testing, the stick was placed in a perpendicular position resting on supports that were exactly one meter apart. The force was then applied at the center of the length by means of an iron bearing, which had a length a little greater than the width of the stick and a radius of 12.5 millimeters. The weights were slowly applied, 50 kilograms at a time, after each weight was added, the weights were removed and the set read; the weights were again applied, the reading again taken at 200 kilograms, and then at every 50 kilograms until the stick was broken, the breaking weight being noted. In making the report, the coefficient of elasticity for the weights, 50 and 100 have been calculated; also the modulus of rupture.

So far I can only give the most general results in regard to these tests. In the first place we have not been able to establish any general law in regard to the direction in which a stick is the strongest, that is, parallel or perpendicular to the annual rings.

The Results Have Shown,

However, that it is by no means necessary to break two sticks to show which is the strongest, provided they are of the same kind of wood. The weak stick will show the largest deflections from the start. The strongest stick found was a specimen of locust, but following closely after it were specimens of hickory and Southern pine. Ash was found to stand well up to a certain point, and then it gave way suddenly and without warning, generally shattering badly. The California redwood was another that shattered very much. White oak was found to be inferior in strength to several other oaks and to Southern pine, the average breaking weight of 40 specimens being 386 kilograms, while the average breaking weight of 8 specimens of *quercus prinoides* or the cow oak of the South was 528 kilograms.

The average of 27 specimens of *pinus australis* was 490 kilograms. The average of 36 specimens of the Douglas fir from the Pacific coast was 374 kilograms, and of 6 specimens of the Western larch was 323 kilograms.

Thirteen specimens of white pine (*pinus strobus*) gave 274 kilograms.

Eleven specimens of beech gave an average of 454 kilograms.

Sixteen specimens of *carya sulcata* averaged 464 kilograms.

Twenty specimens of *carya alba* averaged 512 kilograms.

Twenty-four specimens of white ash averaged 378 kilograms.

Eight specimens of locust averaged 543 kilograms.

The next series of tests which were made consisted in taking specimens of the same size, square as before, and 32 centimeters long, and compressing them in the direction of their fibers. Here again both locust and Southern pine stood up well.

Nine specimens of locust stood an average weight of 11,206 kilograms.

Five specimens of Western larch stood an average of 10,660 kilograms.

Thirty-five specimens of white oak stood an average of 8,183 kilograms.

Twenty-four specimens of *pinus australis* stood an average of 10,498 kilograms. The third series of tests was to find the force necessary to

Indent the Wood

At right angles to the grain. These tests are not finished yet, and I have made no examina-

tion of the results. They are made on blocks four centimeters square and sixteen centimeters long, the bearing of such a size that it makes an impression on the block which extends from side to side of the block and is of the same length; or, in other words, is four centimeters square.

In closing this paper I wish to express my thanks to Col. Laidley for valuable suggestions made during the progress of the work, and to Mr. Howard for the able manner in which he has executed the tests. These tests have been made at the joint expense of the War Department and the Census Bureau, the machine having been put at our service by order of the Secretary of War.

The tests will all probably be published in the annual report of the testing machine, calculated in feet and pounds.

The Mount Cory Mine and Mill.

Two years ago the Mount Cory Mining District was scarcely heard of outside of Esmeralda county. It contained a number of good claims, but no mines developed sufficient to attract much attention. The prospectors knew it was a good camp, but had no means with which to prove their assertions, and, owing to the refractory character of the ore, they could not then realize anything from the proceeds of their claims. It was, in fact, what many other camps are now—a rich but unimproved district, awaiting the coming of men who had money to invest and faith and energy to pursue their plans to a successful completion. The Walker Lake *Bulletin* has a very extended description of the Mount Cory mine, from which we take the following:

The mine, situated at the head of Big Squaw canyon, is in a granite belt, through which a well defined porphyry dyke extends, varying in width from 80 to 260 feet. The ore bodies at present being worked are found in this porphyry, the veins, two in number, being from 18 inches to 10 feet wide. The rich ore bodies in these veins extend on some of the levels for a distance of 260 feet.

Notwithstanding the difficulties encountered in overcoming natural obstacles in one of the most rugged mountain ranges in the State, the development proceeded rapidly, and now the mine is worked at a depth of 560 feet, and has five levels, opened at intervals of about 100 feet. There are about 5,560 feet of drifts and crosscuts and 1,015 feet of winzes. From tunnel "E," the lowest tunnel, a large two-compartment winze is being sunk which is down about 100 feet. This winze is distant from the vein about 50 feet, and crosscuts will be run from it at every 100 feet of depth. In tunnel "E" there are three distinct and large ore bodies, and there is every reason to believe that they extend to a great depth under the present workings.

The company, in order to facilitate its operations and to prevent future embarrassments in carrying out its plans, purchased the Nichols ranch, at the mouth of the canyon, with all the water rights, and this was fixed upon as the site of the immense mill, which has just been finished. The owners of the mine also purchased and perfected the title to 4,000 acres of timber land. This gives them an ample supply of fuel and timber for many years, both for mine and mill.

One of the greatest difficulties encountered by Mr. McKenzie in the early stages of his work was the obtaining of supplies at the mine, and in the fall of 1882 he began the construction of a wagon road from the mouth of the canyon. This road, laid out through one of the roughest gorges in the mountains, was an arduous undertaking, but engineering skill and generous outlay of money has made an easy grade and good roadway for business and travel.

In February, 1883, when the road was nearly finished, the wonderful wealth of the mine had become an established fact and the town of Coryville was laid out on the line of the road and about half a mile below the town. This town now contains numerous dwellings and business houses, and a certainty of a brisk and prosperous era is entertained by the residents.

The operations of Mr. McKenzie having shown great quantities of rich but refractory ore, it was thought advisable to erect works by which the reduction could be performed near the mine and the cost of transportation saved.

W. I. Salkeld and W. R. Eckart, the contractors for the construction, ably assisted by their foreman, J. W. Cline, have, by the perfect manner in which they have completed their work, considerably added to their reputation as successful engineers. The mill, now finished and in complete operation, is under the management of Mr. A. Arents, one of the best known workers of precious metals on the coast.

The outlay to the present time has been over \$400,000, of which by far the greater part has been spent in Esmeralda county in labor and improvements. This, with the certainty of future production, will soon require the employment of many men, and gives a solidity to the character of the business outlook of this section which is gratifying to those who have located here with the intention of remaining.

There are now forty-five men employed at the mill and seventy at the mine. In addition to this, other mines are being actively prospected, as the successful working of the Mount Cory ore puts an immediate and definite value on their output.

MECHANICAL PROGRESS.

Heating and Hardening of Steel.

To understand how to properly harden and temper steel tools and other articles, is fully as necessary to the machinist now, when most small tools are kept in stock by dealers, as it was twenty years ago when each shop made its own tools. Lathe and planer cutters, cold chisels, milling cutters, and several other tools and appliances are liable to breakage, and must be redressed at the anvil, refinished, and rehardened and tempered. But many of these tools are ruined in this attempt, and this destruction usually comes in the hardening.

Some mechanics attach much importance to a hardening pickle, but probably failure comes as often by hardening and tempering. An evenly distributed heat of the proper temperature is absolutely requisite to success, and this is not always possible to assure by heating in an open fire. One portion of the article is liable to be overheated; judging of the amount of heat by color, is not always to be trusted; a dark corner or a cloudy day changes the conditions from a light shop and a sunny day sufficiently to make a great and telling difference in the amount of heat induced by sight.

A perfectly reliable method of heating and hardening is by means of the lead bath. It is an easy matter to keep in the shop a crucible or hot iron pot of lead to be used as occasion demands. The article to be heated for hardening will not suffer when in the lead bath, even if not closely watched, as is necessary at the open fire; the melted lead cannot pass to a degree of heat injurious to the steel. But one condition must be strictly observed—the lead must be pure and clean; it is best to buy the mercantile pig for this purpose. A manufacturer of pipe threading and pipe-cutting tools in New England city, desiring to abandon his old-time open fire for the lead bath, melted a lot of old lead pipe, partially corroded, and mixed with it a quantity of type metal. His hardening was a failure until he used pure lead.

In order to harden well, it is necessary to heat the article through and through. If the piece is of unusual thickness, as a tap or reamer of three inches or more in diameter, it is better to drill a hole through it from end to end, so that the heating can be even and the hardening equal. A tap of four inches diameter broke squarely across in the hardening. It was of solid steel. The drill of an inch hole from end to end was practiced, and a large number of the same size taps were hardened without a failure. The surfaces of the fracture of the broken tap showed plainly the evidences of unequal heating and uneven cooling.—*Manufacturer and Builder.*

Massive Machinery.

An interesting description is given, by a correspondent of the *New York Times*, of a mammoth wheel made by the Dickson Manufacturing Company, of Scranton, Penn., for use in the copper mines of the Calumet and Hecla Mining Company, on the borders of Lake Michigan. It is the second wheel of the kind made at the same establishment. The weight of the wheel is 62 tons, and its cost in place will not be less than \$25,000. The titanic wheel, says the correspondent, is a marvel of mechanical ingenuity, strength and skill. The spur-gear in the center is 43 feet in diameter at the pitch line, 42-inch pitch, 12 inch face, the teeth of which have all been milled or cut cycloid, and are mathematically correct. There are 352 of these teeth on each wheel, and its circumference at the pitch-line is 135 feet. On each side of the spur-gear there are 25 double elevating buckets or pockets inverted, making in all 100 buckets, which are stationary on the inside of the periphery of the wheel, and are capable of scooping up at a single revolution nearly 2,000 gallons. The wheel will make four revolutions per minute, lifting 8,000 gallons in that space of time, or 480,000 gallons an hour. The office of this wonderful wheel is to remove the refuse from the copper ore. It will be set in solid masonry, with arches through which the launders used for washing the ore will pour their contents, to be taken up by the buckets already referred to and deposited in outlet launders placed at an elevation of 40 feet, which will afford a sufficient impetus to carry the waste into Lake Michigan.

The enormous amount of refuse now made at this mine covers an acre of ground 1 foot thick every 48 hours. This is a great drawback, and entails heavy cost on the company. The shaft upon which the wheel revolves is 30 inches in diameter, and is made of gun iron. It rests in ponderous pillow blocks having universal bearing. The centers of the wheel are octagonal, and its mighty arms are made of wrought-iron lattice-work. They are pyramidal in shape, and jutting out from a common center present an imposing appearance even in repose. The ends of the arms, which are called the bucket segments, are of cast iron, and the spur segments and buckets are bolted to them. The entire affair is put together with turned bolts driven in reamed holes.

THE ELECTRO-MOTOR.—It may certainly be said that for pumping, sawing, and such like operations of a large country house, an electro-

motor, actuated by the dynamo which lit the house at night, would be cheaper and quite as effective as a steam engine. Sir William Armstrong, at his house near Newcastle, has utilized a waterfall in his grounds to light his house by night and to supply it with power by day. The waterfall is 1,500 yards from the house. It actuates a turbine, which it connects by a belt to a dynamo electric converter, capable of transmitting about five horse power into a current of electricity. The current is conveyed by a suitable conductor to the house where it works forty Swan lamps. In daylight it works a saw-mill. Sir William Semans, at his country seat, near Tunbridge Wells, uses a steam engine, the waste steam of which warms the hot-houses. During the night the primary machines actuate two powerful electric lights, which are employed in forcing the growth of various fruits and plants which live, as it were, in perpetual sunlight—or its equivalent. During daylight one of the machines is used to work a chaff cutter and the other machine at the farm a quarter of a mile away; the other does the pumping of the establishment. At night, of course, they are employed for light.—*Nineteenth Century.*

MACHINERY PROGRESSIVE.—Some manufacturers, says the *Mechanical World*, in fact probably the majority of them, when once they have put down machinery for a given class of operations, consider that they have done everything that is needed, never dreaming that tools and machinery can be, and are constantly being, improved. They are horrified if they are told that it would pay them to pull out a given machine; they appear to have a pride never to have a new machine. The various machines work away from year to year—the smiths' forges, the shafting which was put down at the starting of the works—there they remain, doing good work, perhaps, but not the best work, not the quickest and cheapest work, and therefore the works become old-fashioned; the workmen fall into ruts and become old-fashioned as well as the machinery. A machine should never be allowed to become worn out; it should be replaced by an improved one long before that period arrives.

A NEW ELECTRIC ENGINE.—A small electric engine has lately been on exhibition in New York, having a piston movement, and claimed by the inventor to be the first of that kind which has been manufactured in this country. The engine is supplied from a battery and consists of four electro-magnets, two on each side, with armatures of permanent magnets. While one attracts, another repels, giving the piston movement of the common steam locomotive, and the little engine is similar to this in the remainder of its mechanism. This engine of two horse power, the inventor says, will revolve from 600 to 1,000 times per minute. It cost \$150, and the electricity of a storage battery to run it a day of 12 hours will cost, he estimates, 50 cents. It takes up little space, and can easily be placed under a car. Its inventor also hopes to adapt it to road carriages, and believes that cabs can be run by it for 50 cents a day.

THE USE OF ALUMINUM PROCESS for the decoration of iron and steel, as well as for their protection against rust, is spoken of in the German technical press. The process is intended to take the place of nickeling, tinning and coppering. The coating of aluminum is said to leave the sharpness of outline unimpaired, and to adhere very closely, being applicable to both cast and wrought work. Decoration with gold, silver or vitrifiable pigments is said to be facilitated by this method. It is considered that the high price of aluminum—caused by the expensive processes by which it is made—will not seriously affect the success of this process.

THE USE OF LIGNITE.—In the course of a discussion on artificial fuel before the Hanover branch of the German Society of Engineers, it was stated that experiments made by Herr E. Fisher with lignite containing 60 per cent of water and having a calorific value, when coming from a mine, of from 1,000 to 1,500, have when dry from 3,000 to 3,500. The best temperature for lignite seems to be 450° Celsius, when the aid of steam is introduced. In this way 32 per cent of the weight of the moist lignite is obtained in the form of coke, holding from 6 to 7 per cent of ash and having a calorific value of 7,500, equal to a fair quantity of bituminous coal.

IRON RAILS BECOMING OBSOLETE.—The production of iron rails seems to have ceased substantially, at least in England and this country, and 1883, apparently, is likely to be very near the date of their disappearance. In that year only 25,000 tons of iron rails were exported from Great Britain, out of a total of 770,000, the total being within 8,000 tons of the great quantity annually exported from this country for twelve years or more. In 1878, when the total British rail exports were but 358,750 tons, 30 per cent of the whole were iron rails; last year only 31 per cent of the whole were of iron.

POLISHING VENEER WOOD.—After scraping up veneer, first give a coat of size for stopping up grain, then color or stain, and proceed to polish. It is a great mistake to use too much oil. For all hard woods the polishing is the same, but not for stopping, as size is generally used for dark wood and plaster or chrome for light. Putty-line is a good stain for Honduras mahogany, chestnut and other woods.

SCIENTIFIC PROGRESS.

How Smoke is Formed.

Hundreds of articles have been written, and have been printed in newspapers, and many valuable lectures have been given, on the important subject of smoke and its destructive properties, but I have never met with a clear explanation as to how smoke is formed or what is the cause of smoke forming. In the most important book of the Smoke Abatement Exhibition even, where the highest talent of the day kindly gave valuable time to the subject, not a sentence is given as to how or in what way smoke is formed. I may almost go further, and say that it appears as if learned men do not agree, or have not made up their minds, if in certain cases smoke is formed, or if the smoke so formed is afterwards consumed. I have a circular before me where the test of a boiler is given by a high authority, which states: "The boiler either does not produce or it consumes its own smoke." This will show that there is not yet a clear explanation before the public as to how smoke is formed, and I maintain that cause and effect ought to be properly understood before the necessary care in preventing it can be taken; therefore, a clear and most simple case may be here stated.

It is well known to every one that when fresh coals are placed on a fire in an open fire-grate, smoke arises immediately, and the cause of this smoke is not very far to seek, as it will be easily understood that before the fresh coals were put upon the fire within the grate, the glowing coals radiated their heat and warmed the air above, and thereby enabled the rising gases at once to combine with the warmed air to produce combustion, but when the fresh coals are placed upon the fire the coals absorb the heat and the air above remains cold.

By gases I mean the gases arising from coals whilst on or near a fire; and it may not be known to every one that we do not burn coals, oils, tallow or wood, but only the gases arising therefrom. I can make this clear by the lighting of a candle, which will afford all the information required. By lighting the candle fire is set to the wick, which by its warmth melts a small quantity of the tallow below, and this melted tallow is directly absorbed by the capillary tubes of the wick, and thereby so very finely and thinly distributed that the burning wick has heat enough to be absorbed by the small quantity of dissolved tallow to form the same into gases, and these gases burning, combined with the oxygen in the atmosphere, gives the light of the candle. A similar process is going on in all other materials, but coal contains already about 17 per cent in weight of gases, which liberate themselves as soon as they get a little warm. The smaller the coal the more rapidly will the gases be liberated, so that in many cases only part of the gases are consumed.

To return to the subject, this fact is that the volatile rising gases from the coal cannot combine with the cold air for combustion, still a combination does take place in the following way: The cold air, in the act of combination, absorbs a part of the warmth of the rising gases, which they cannot spare, and therefore must condense, so much so that small particles are formed, which aggregate and are called smoke, and, when collected, produce soot; but so long as these particles and gases are floating they cannot burn or produce combustion, as they are surrounded by a thin film of carbonic acid. It is only when collected and the acid is driven off that they burn rapidly.

I have now shown that cold air is the cause of smoke, which may be greatly reduced by care. In the open fire-grate the existing fire ought to be drawn to the front of the grate, and the fresh coal placed behind or on the back of the fire. The fire in the front will then burn more rapidly, warm the air above, and so prepare the rising gases for combustion. In this way smoke is diminished, as the gases from the coals at the back rise much more slowly than when placed upon the fire and the air partly warmed. The same process may be applied to kitcheners, thereby almost entirely preventing smoke after the first lighting. For stoves and boilers, warm air may be produced for the entire combustion of all gases.—*Cor. London Iron.*

An Interesting Experiment.

The experiment here described, though containing nothing new to those familiar with the principles of acoustics, may be of some interest to a class of our readers who are students of this science, especially as it is something not occurring on such a scale in even the most noted laboratories of the country. We copy from a correspondent of the *Scientific American*:

In illustrating the longitudinal vibrations of rods and tubes, I held firmly in one hand, at about the middle, a large glass tube, and rubbed it back and forth with a wet woollen cloth held in the other hand. The sound produced was quite loud and piercing, and was of itself sufficient to excite the interest of a large class seated before me. So energetic, indeed, was the vibratory motion that I felt rather apprehensive for the safety of the tube. Suddenly a crash came, just below the hand that held it, and the tube for a length of nearly three feet was shivered to many pieces. The fragments were, I suppose, of a mean length of two inches,

and the tendency was to break into rings somewhat approaching the wave-length of the vibrations constituting the sound emitted.

The tube was about 6 feet long, about 2 inches in diameter, and the glass more than an eighth of an inch thick. It will be seen from these dimensions that it was quite a stout pipe, and the effort to break it with the hands, even across some point as a fulcrum, as the knee, would have involved the exertion of a great deal of strength. Yet there was very little muscular strength exerted, and that not directly against the strength of the material. Moreover, the shattering occurred in the half below the hand, and was not of the part rubbed by the cloth.

SOMETHING ABOUT FOG.—The vapor in the atmosphere is nearly or quite transparent, but when, from any cause, the air becomes cooled below the dew point, a portion of its vapor is precipitated in the form of drops of water extremely minute, which affects the transparency of the air and forms fog or cloud, according as it occurs near the surface of the earth or in the upper regions of the atmosphere. When steam rises from a vessel of warm water and mingles with a cold atmosphere, a portion of the vapor is condensed and a mist is formed. This mist is sometimes, but improperly, called vapor. Vapor of water is a gaseous body, while mist is a liquid body. A similar condensation often takes place in nature upon a large scale, and the mist is then called fog. Fogs are most prevalent near the banks of Newfoundland. These fogs occur in every month of the year, but they are most frequent in summer, when the banks are enveloped in fog nearly half the time. The vapor which causes these fogs is furnished by the warm air of the Gulf Stream, which is condensed by the cold air of the banks, the contrast of temperature being here more sudden than is found in any other part of the Atlantic ocean. During July the water on the banks frequently has a temperature of 45 degrees, while within a distance of less than 300 miles the Gulf Stream has a temperature of 78 degrees. The contrast in temperature is almost equally great in January, but fogs are less frequent in winter, because at that period the air is more agitated by storms, which tend to equalize the temperature over different parts of the ocean.

ELECTRIC LIGHT AND NOXIOUS INSECTS.—A European journal relates that a few months since workmen employed upon some constructions on the bank of the river Dnieper, in Central Russia, employed the electric light to enable them to prosecute their labors at night. The brilliant rays of light attracted so many millions of nocturnal moths, beetles and other insects that from time to time it was necessary to stop work and set all hands to destroying the clouds of winged victims that frequently completely obscured the light. This suggested the idea of employing the electric light to destroy nocturnal insects prejudicial to agriculture, and experiments in that direction are to be tried next spring. Not only to insects, but to fish, the light proved fatally attractive. Its rays, directed to the surface of the water, drew together vast quantities of all the fishes found in the Dnieper, and when within the charmed field of illumination they lay crowded together in masses, seemingly blinded and stupefied. The workmen, improving the opportunity, made a notable haul of fish.

CIRCULATION OF SOLAR ENERGY.—M. Duponchel calls attention to a work, printed in January, 1882, in which he stated that the actual facts of science in regard to the nature of light, heat, electricity and magnetism testify to the absolute conservation of the living force which is manifest under divers forms of motion. Many years ago he tried to explain how the compensations could be effected, which are necessary to maintain the energy, and how the heat which is emitted can return to the focus of departure, forming a closed current and a continuous circulation analogous to that which results from the action of the heart upon the movements of the blood. The views which have lately been published by Siemens have induced him to undertake a mathematical discussion of the question and to confirm the results of his theory by facts of observation.—*Rev. Scientific.*

PHOSPHOR-MANGANESE TIN AND COPPER.—An English firm says they have, after a long series of experiments, succeeded in alloying manganese with phosphorus and tin and copper, producing a metal which, for tensile and strength and durability, they think will be superior to any alloy in the market. The phosphor-manganese tin may be used in the same manner and in similar proportions as phosphor tin, though it is better to cast at a little higher temperature, but the result will be found much superior, both as regards hardness and tensile strength.

CONTENTS OF FRESH FALLEN SNOW.—The *Popular Science News* says that a Swiss scientist named Floegel, found in the freshly fallen snow living infusoria and algae, bacilli and micrococci, mites, diatoms, spores of fungi (in immense numbers), also fibers of wood, mouse hairs, pieces of butterfly wings, skin of the larva of insects, cotton fibers, pieces of grass, epidermis, pollen grains, rye and potato flour, grains of quartz, minute pieces of roofing tiles, with bits of iron and coal. Poets must hunt up some other emblem of purity.

Passing Events.

The phenomenal rainfall in the Southern part of this State is attracting great attention. The overflow of streams, washing away of bridges and stoppage of railroad travel is something very unusual in that region. In the central and northern portions of California much rain and snow have fallen. There will be plenty of water this spring, and a prosperous year is assured.

The topic of the hour is the Governor's proclamation calling an extra session of the Legislature. We publish the call in another column. The Coeur d'Alene excitement still continues unabated, and many miners are preparing to leave for the new region as soon as the weather warrants.

ABRAHAM LINCOLN's tomb at Springfield, Ill., is going to ruin. Two of the supporting arches have collapsed, one corner of the monument has settled several inches, and it is estimated that the restoration will cost \$4,000.

A SNOW-SHOER says he saw over 500 dead jack rabbits while crossing from California to Reno. They had starved and frozen to death, and were but a few feet away from their burrows.

SEVERAL rich pocket mining strikes have been made in Tuolumne county during the past six weeks.

Classes of Coals.

The commercial distinction between anthracite, semi-anthracite, semi-bituminous and bituminous coals is largely governed by the geographical location of the mines from which the coal is obtained. These arbitrary commercial distinctions are difficult to break down, even if it were worth while. The following rough generalization may be useful, but its utility is limited by the fact that the coals of each class, as known to the trade, overlap into those above and below it:

In coals known as anthracite the volatile matter is usually less than 7 per cent; semi-anthracite, volatile matter usually less than 10 per cent; semi-bituminous, volatile matter less than 18 per cent; and bituminous, volatile matter less than 18 per cent. The different varieties of semi-bituminous and bituminous coals are thus grouped and described by Professor Rogers.

Semi-bituminous includes semi-bituminous cherry coal and semi-bituminous splint coal. Bituminous includes coking coal, cherry coal and splint coal.

Anthracite coal is characterized by its small percentage of volatile matter, high specific gravity, hardness, nearly metallic luster, rich black color and semi-conchoidal fracture. It ignites with difficulty, produces an intensely hot fire, giving off no smoke, and burns with a very small blue flame of carbonic oxide (produced by incomplete combustion), which disappears after the coal is thoroughly ignited.

Semi-anthracite coal is neither as hard nor as dense as anthracite, its luster not so brilliant; its percentage of volatile matter is greater, and the cleavage planes or "cleats" are much closer the fracture, often approaching the cuboidal. This coal when once ignited burns at first with a flame somewhat resembling that of bituminous coals, but this shortly ceases, and the anthracitic character of the coal becomes at once apparent.

Cherry coal is a deep black, dull or lustrous coal, with a conchoidal fracture, readily breaking up into cuboidal fragments. It ignites easily, making a hot, quick fire with a yellowish flame, and retains its shape until thoroughly consumed. Its specific gravity is much less than anthracite, about 1.30.

Splint coal is of nearly the same specific gravity as cherry coal, which it somewhat resembles. It has a slaty longitudinal and a very uncertain cross-fracture. It is not very easily kindled, and makes a slow, dull fire.

Cherry and splint coal, of both the bituminous and semi-bituminous varieties, usually leave a rather large percentage of ashes.

Cannel coal is remarkable for its dull slaty or resinous luster, its conchoidal or slaty fracture, and its large percentage of volatile hydro-carbon. It burns with a long flame, giving off a large amount of smoke, and usually leaves a very large percentage of ashes.

Caking or coking coal, the most important of the bituminous coals, is readily known by its behavior in the fire. It burns with a long yellow flame, giving off more or less smoke, and creates an intense heat when properly attended. It is usually quite soft, and does not bear handling well. In the fire it melts, fuses, and finally runs together in large masses, which are rendered more or less porous by the evolution of the contained gaseous hydro-carbons. The cleat or cleavage joints (butt and face) usually run nearly at right angles, giving the coal a cubical fracture.

Coals of the hard, dry anthracite class burn without smoke or colored flame (but with a faint blue flame until thoroughly kindled); they have a small, almost colorless and intensely hot flame when thoroughly ignited, but ignition is always slow and difficult.

CALIFORNIA MINING LIFE.—There has just been issued by Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, a little pamphlet by Dr. Henry DeGroot, entitled "Recollections of California Mining Life." It treats of the primitive placer mines and discovery of gold; the pioneers of the pioneers—their fortune and their fate. Many early legends are given. There is a short sketch of General Sutter and one of James Marshall. There are several characteristic engravings made from drawings by artists here in early days. The little pamphlet is sold for 25 cents, and will interest many old Californians and those who like to hear of them. The articles were originally published in the MINING AND SCIENTIFIC PRESS.

Foundry Notes.

The Pacific Iron Works, as usual, are turning out a large amount of mining and other machinery destined to various localities. Among the orders recently filled and now under construction may be mentioned the following: A 60-ton copper plant for the New Jersey and Sonora Copper Co., at Nacasari, in Mexico; a 10-ton copper plant for the Presidio Co., of Chihuahua, Mexico; a 10-ton copper plant for the Dunchess Co., at Battle Mountain, Nevada; two 30-ton copper and lead plants for Australia; one 30-ton copper plant for the Copperosity mines, in Arizona; a heavy set of pumping and hoisting works, for the Washington Mining Co., of Forest Hill, Cal; an 80-horse power hoisting works for the Old Dominion Copper Co., of Globe, Arizona; a 14x36 Wheelock automatic cut-off engine for the Stockton Agricultural Works, and one of the same size for the Judson Manufacturing Co., of Oakland; a 10-stamp gold mill for the Buena Vista mine of Mariposa county; heavy sugar machinery for Mexico; general overhauling and repairs to the Government steamer "General MacPherson." They have also been sending out a number of the Baker horse power mining hoists, which seemed to be in great favor with miners in all parts of the country.

The Fulton Iron Works are building the machinery for three steamers. One of these vessels is to run between the Hawaiian islands. She will be 75 feet long, with 30 feet beam, and a depth of 12 feet 6 inches. Her engines will have 350-horse power, with a 30-inch stroke. The second steamer is for the Coos Bay trade. Her length will be 145 feet, with a beam of 26 feet 6 inches, and a depth of 13 feet. Her engines will be of 225-horse power, with a 20-inch stroke. The third vessel is a steam schooner 120 feet in length, 27½ feet beam and 10 feet deep. The engines will be of 100 horse power, with an 18-inch stroke.

Some 250 men are now cutting wood and burning charcoal for the iron mine at Hotaling, Placer county. They are trying the experiment this year of using "ground pits." The smelting works will be started up in about two months, when the roads are dry enough for transportation. They will have plenty of charcoal on hand to keep steadily at work. The company have thousands of tons of ore out and much more ready for extraction as fast as it can be handled. The product last year was 15,000 tons of iron, worth \$30 a ton, and it is expected to greatly increase that output during the present year.

The Union Iron Works have nearly completed the large pair of boilers for the new ferry boat Tiburon, which is to run between this city and the landing in Raccoon Straits. The machinery for the new boat is not new, but will be put in by the Union Iron Works.

QUICKSILVER.—On page 142 of the PRESS (Feb. 23d), in the article on "Our Mineral Resources," the district of Cerro Gordo should have been credited with an output of \$15,000,000. The sense of the text of the contract between the Rothschilds and Spain is as follows: The product of the Almaden quicksilver mine of Spain is pledged to the English banking house of Rothschilds to secure a loan of \$8,500,000 made in 1870 to the Spanish government, and payable in 30 annuities of 750,000 each. The Spanish government pledged itself to deliver at the mine yearly at least 32,000 flasks, the price to be regulated by the current London rate, but in no event to go below 46 per flask, say 37 96-100 cents per pound, to which is to be added transportation, expense of sale, etc. When the price is between 46 and 48 the surplus over 46 to be equally divided; when over 48 the Rothschilds receive one per cent and the Spanish government two-thirds of the surplus over 48.

THE STATE MINING BUREAU.—The museum of the State Mining Bureau, No. 212 Sutter street, presents many attractive features and goes far towards a representation of the mineral resources of California and the Pacific Coast. It is open daily from ten to three o'clock and is free to all. The number of daily visitors is not as great as one would expect from the interesting nature of the articles on exhibition.

A LARGE number of men en route for the Coeur d'Alene mines have turned back from Rathdrum, Idaho. At that point there are twenty men for every bed.

Manufacture of Woolen Goods.

How They Make Stockings and Under-clothes.

California has long been noted as a wool-producing region, and some of its articles of woolen manufacture have become recognized as the best in the world. Until within a few years, however, no attempt to manufacture lighter articles of apparel has ever been made here. In February, 1881, the California Hosiery Company began operations in Oakland, but was only measurably successful, owing to lack of experience of the management. For this and other causes, a complete reorganization was effected about a year since. The policy of the former managers was changed materially, and the mills started in to work goods that would sell, and as good as could be bought. The new management has succeeded in establishing a first-class reputation for the products.

A recent visit to these mills by a representative of this journal developed many facts of interest. There are about 125 hands employed, 75 per cent of these being girls. There are no Chinese on the pay rolls and never have been. The proprietors recognize the fact that they could have made more money with Mongolian help, but have declined to employ it.

Handling the Wool.

The wool is purchased here, and is cleaned and prepared in the mills. The bags of wool are opened and sorted by hand into four different grades, one man—an expert—performing this operation. Not all the wool of the same fleece, though it be a high grade of wool, is taken. Parts of the fleece, having a coarser fiber, are set aside for certain classes of goods.

Once sorted and separated it is kept separate, of whatever grade, till it comes out from the knitting machine. After being sorted the work is taken to a machine which "dusts" it, removing loose particles of dust and dirt. Then it is placed in a scouring machine. Hot soapy water is placed in a vat, having appliances for passing the wool along through it. This removes the animal grease, and much of the dirt. This process is called scouring. The wool is then dried by hot air, mixed and oiled. For the latter purpose lard oil is sprinkled over it. The wool is then ready for carding.

Carding.

Formerly the wool was fed to the machines by hand. Batches of regular weight were made up and started in, but now a feeding machine does this better and with great accuracy.

This is called Bramwell feed, and it is placed on the first of the carding machines which are called respectively "first breaker," "second breaker" and "finisher." The Bramwell feed automatically weighs out a certain quantity of wool and drops it to the "first breaker" or carding machine. The operation of the carding machines is so well known it is not necessary to describe it in detail. It straightens out the fiber, cleans off any burrs, sticks or lumps, and prepares the wool so it can be made into yarn. It passes from one to the other of these carding machines in a continuous fluffy coil or festoon about one inch or more in diameter, which is called "roving."

In the Oakland mills there are three sets of feeding and carding machines. The roving is wound automatically on reels, and taken to the spinning jennies, where it is spun into yarn. In all this work, only the yarn has been produced so far, and to make a perfect stocking, ready for market, for instance, there are 19 or 20 other processes. As many persons will be interested in this subject, we shall endeavor to describe, as briefly as may be,

How they Make a Stocking.

After the yarn is spun it goes to the winders, and is wound up on spools, ready for the knitting machines. Very few of the processes are simple. Knitting, for instance, is a manifold process. First, the leg of a stocking is knitted, and then, on another machine, the foot. If merino heels and toes are called for, other changes must be made for these, and if for ornamental merino stripes around the leg, still other changes.

In knitting the stocking, the machine knits a continuous cylindrical-shaped web as long as it runs, and it may be a couple of hundred feet in length. A girl cuts the cylindrical piece into lengths according to size of stocking it is to make. In doing this she throws away any of

the defective pieces, of which she makes a rapid examination during the cutting process. These leg pieces are then taken to other machines, which respectively put on the foot, heel and toe. Before doing this the pieces are "raveled," that is, the frayed edges are taken off, so that the little loops of the fabric can be readily put on the machine which fits the foot and heel. The machines for doing this work are marvels of perfect mechanism, but they require skilled labor to operate them. The loops of the fabric are deftly caught onto the hooked needles of the machines by the girls who have them in charge, and missing a single loop will make a defect in the finished fabric. After the heel and toe are closed, then the seaming is done. This means that the two pieces of the foot are closed together along the sides.

Rough mending follows. All the stockings are examined and mended and trimmed. The stockings are then taken to the dye vats, where they are dyed, if the yarn has not been first dyed, which is not usual with stockings. When they come out of the dye they are "hoarded." Thin pieces of board the shape of a leg and foot are prepared in various sizes; over these the stockings are slipped, as on a leg. These boards are then placed in a drying room, and the stockings dry on them. When the stockings are taken off these stretchers or molds they are of the proper shape and size for use. But still the process of preparation for market is not complete.

After being dried they are inspected carefully and the "fine mending" done, so that no imperfections may escape notice. Ladies' stockings particularly must be carefully examined. In buying, the gentle sex examine the goods very accurately, and as a general thing are apt to find any imperfection. When the finished mending is completed the stockings have to be "mated" or put in pairs. Then they must be "tacked," the toes and tops being tacked in pairs. They are then folded, pressed, stamped, labeled and boxed ready for market. The various methods of manipulation are very interesting.

The hosiery made at these mills is made wholly of wool, except the heels and toes, which are made of "merino," some cotton in these portions making the stocking wear better. The word "merino" originally meant the fine wool of the merino sheep, but usage has established this secondary meaning, so no one is deceived by it. While any admixture of cotton diminishes the usefulness of a stocking to the wearer in respect to warmth, it increases it in respect to durability, and enables the maker to put in certain pleasing effects of color in the dyeing. Vegetable and animal fibers require different preparations to take dyes. A knowledge of this fact enables the manufacturer to arrange for varieties of color in the finished fabric when the two substances are woven with the same stocking.

To knit a merino heel or toe into the foot of a woolen stocking, the machine is set to knit a certain number of courses of woolen threads, and, these courses knit, it stops. Then it knits another certain number of courses of merino, and again stops. Then it is taken off the needles. The process of mending, before referred to, may need more explanation. Sometimes, from the imperfect operation of one or more needles of the machine, a stitch or stitches may be dropped, which of course leaves a hole in the fabric.

This has to be mended, not in the ordinary household way with a darning needle, but with a sort of crotchet needle, by which the nimble-fingered young women close up the aperture with a perfect knit stitch that blends undiscernably with the machine stitches. The seaming, by the way, is done outside the factory by families who come and get the goods and return them when completed. Some of this work is also done in the Magdalen Asylum, on this side of the bay.

Other Articles.

In addition to the ladies' and children's hosiery of all kinds, men's half-hose, men's heavy socks, etc., the mills also make first-class underwear for boys, youths and men, ladies and misses. In making an undershirt there are several processes. The body is made on the machine as a continuous cylinder, like the stocking leg. After it is knit it is cut in lengths of suitable size (after marking). Then the holes are cut for the arms and the hollow of the neck is cut, and they are "grafted." The cuffs are "rubbed," the ends being sewed on. When

the arms are in, the shirts are "bearded," that is, put on shaping-boards and dried. The shirts are faced with linen, the button-holes made, and they are stamped, pressed and boxed. All these different processes are carried out by girls.

The various goods are made "on honor" of the very best material. When the stamp says all wool, they are 100 per cent wool. The result is they have plenty of business. Last year the difficulty was in supplying, not in selling goods. They pay out about \$50,000 a year in wages. The company's policy has changed since Mr. John Lee, the President, took hold of it. He is a practical, experienced man, with a knowledge of the details, which has been of great value. Having been for many years one of the most expert wool buyers on the coast, his skill has been of the greatest use to the company. The salesroom is at 31 Sutter street, in San Francisco. The officers are: John Lee, President; V. D. Moody, Francis Blake, Hugh A. Chase, Peter Thompson, Chas. W. Reed and E. T. Flint. Mr. John Williams is Secretary. There is no superintendent, the President and Secretary doing the practical management and attending to all details. A peculiar feature is that the mills do not shut down at noon, but relays of hands keep the work moving all day. The company is now well established in a prosperous and growing career. The mill is of brick, roomy, well lighted and ventilated. The operatives are in cleanly and healthy quarters, and have plenty of room in which to perform their work. The girls all live at home with their parents. The company is about putting in new machinery and extending the works materially.

Big Bend Tunnel.

Work in the Big Bend tunnel at Big Bend, Butte county, in this State, is being driven day and night with three shifts of men working eight hours each. It will be remembered that we described this tunnel scheme in the PRESS, December 17, 1881, when work was commenced. It is the intention to turn the water through the tunnel, so as to work a section of the Feather river where rich diggings exist. Work continues to be energetically pushed. During the past year the company built roads, put up a telephone line, built several wood roads to the timber, bought about 1,000 acres of land, and otherwise put matters in shape. The cost of constructing the tunnel has fallen within the original estimates. Mr. N. A. Harris is the superintendent and Mr. Cribbins the foreman. The president is R. V. Pierce, and secretary Jas. A. Roberts. The head office is in Buffalo, New York. The following is a summary of operations during the fiscal year:

The total number of holes drilled during the year 1883, was	11,124
The total depth of holes drilled was	58,598 ft.
Average depth of drilling	5,267 ft.
Time occupied in drilling	2,558 hrs. 38 min.
Average time per shift, of eight hours	2 hrs. 22 1/2 min.
Actual number of working shifts, of eight hours each	1,077
Number of drills sharpened	15,038
Number of car-loads of rock extracted	33,592
Average number of car-loads per shift	31.19
Number of pounds of No. 1 blast powder used	32,115
Number of pounds of No. 2 blast powder used	8,035
Average number of pounds of No. 1, per running foot	9.167
Average number of pounds of No. 2, per running foot	2.293
Total progress made in 1883	3,503 ft.
Average progress, per month	291.0 ft.
Average progress per day (359 days)	9.757 ft.
Average progress per shift of eight hours	3.252 ft.
Greatest distance made in July	375 ft.
Least distance made in August	175 ft.

For the first seven months of the year the tunnel was driven through a blue slate formation, which was good drilling and blasting ground; for the last five months it was driven through an exceedingly hard variety of rock, work at times being very seriously delayed by a strong flow of water.

PATRICK CAMPBELL, who controls the Golden Gate Hydraulic Mining Company, of Smartsville, was, on Monday, fined \$500 by Judge Keyser, of the Yuba county Superior Court for contempt of court in violating an injunction issued in the debris suit brought by Yuba county against the company. Campbell for a long time evaded service of papers and operated the mine in defiance of the injunction.

MR. SAMUEL J. HENDY was elected one of the Trustees of the Mechanics' Institute at the recent election. Mr. Hendy is an energetic young mechanic, strongly indorsed by his fellow workmen and others. His name has already been placed in an enviable position among mechanics and manufacturers by an older member of the family, and we trust the patronymic will now gain additional luster.

Industrial Notes.

The machinery for the proposed cotton mill at Oakland has been shipped from Liverpool and will be here within a few months.

Preparations for the new glass works at Oakland are going ahead. The ground on the marsh near the rail works has been leveled preparatory to drainage. The foundations of the buildings will soon be laid.

The prison labor contract system is about to be investigated by the Labor Bureau Commissioner. Furniture and harness manufacturers are those especially affected by the present system.

The jute mills at Oakland are running over time, and have 350 men at work. The jute works at the States Prison are lying idle for some reason.

The proposed woolen mill enterprise at Galt has been given up for the present.

The Los Gatos Fruit Packing Company last season employed some ninety hands.

The Oakland Nail Works put a number of new hands at work on Monday, in place of those who struck a short time since. Although more disturbance was expected none occurred.

On Monday last nearly thirty of the leading cigar manufacturers of this city, representing a capital of several millions of dollars, closed their doors upon over 3,000 of their Chinese laborers. This course was adopted in pursuance of an agreement entered into between them as members of the Pacific Coast Cigar Manufacturers' Association. This association is held together by fines and penalties so binding that any infringement of their rules would be ruinous to the signers. Its organization was due to the fact that the Chinese cigar makers have formed trades unions, and by a series of strikes in different factories, and by openly disrespectful conduct to their superiors have made life intolerable to their employers. It became a question who was to be the boss—the capitalists or the heathen Chinese. For some time past the leading manufacturers have been anxious to supplant Chinese labor with that of white girls and boys, as being more reliable. The manufacturers propose to send to New York for white cigar makers, and keep them altogether, shutting out the Chinese entirely.

At Turner's ship-building yard, near Benicia, there are several vessels in process of construction, one of them an auxiliary steam schooner for northern waters.

Local builders are working on several new yachts. John Purvis, of Oakland, has nearly completed a 40-foot schooner, which has just been sparred and rigged. Wm. Stone has on the stocks a 40-foot schooner, which is completed but has never been launched. He has a 40-foot yawl also which is nearly done. This vessel is quite narrow, according to the types in ordinary use here, and is also pretty deep; she will carry a center-board, however. She will soon be ready for launching. He has partly completed a 47-foot schooner, which will be used for pleasure purposes. Stone's yard is now quite a busy place. In addition to the yacht builders' work, the boat builders are busy. Griffin is working on a fine new lapstreak harge, which is to go to Stockton for a new club. Vice is at work on ships' boats. Twobig has work ahead of him, and Robertson is building a wherry. Farmer, of Oakland, has just finished a finely-built lapstreak yawl boat, and is now repairing the Fleetwing.

The cannery at Collinsville is working thirty-three Chinamen, making cans for the coming season. It is said they intend making between 1,500,000 and 2,000,000 cans.

The Oakland Woolen Mills is having made a new set of boilers, and is making arrangements to have a brick stack built, the plans for which have been drawn. A lot of new machinery is on the way from the East for these new mills, which will add to their capacity.

ALLEGED GOLD DISCOVERIES.—An Albuquerque, New Mexico, dispatch announces new and rich discoveries of gold and copper are reported from Hell canyon, eighteen miles from this city, and a rush to the Sandias is likely to be the outcome of these discoveries. The Sandias are known to have been worked hundreds of years ago by the natives, some old-time shafts with the rude, notched log ladders being still in existence. Many mining claims have been located in this range by our citizens, but the lead in which this rich find is reported is the only one on which work has not yet been done.

Bodie.

FROM OUR TRAVELING CORRESPONDENT.

Bodie as a district has its advantages that are worthy of special mention. Its geological formation is very favorable for genuine mineral veins of permanent character, the country rock being mainly a porphyritic dyke. The external shaping of ground where nearly all the mines are situated is such that neither the scientist nor his partner, the practical operating miner, could easily suggest any change of shaping that would be accepted by others as any improvement, or more convenient, for the mining and milling machineries.

The altitude is great, insuring them some advantages in deep mining, and though more elevated than the top of Mount Davidson, yet it has its railroad for wood and lumber supplies passing along above all these principal mines and mills, bringing ample supplies of very good wood and lumber from vicinity of Mono lake, about 30 miles distant. This railroad is now considered a valuable adjunct and security for the town's indispensable wants, and will still more benefit it when it passes on a little farther to connect with the Carson and Colorado railroad at Benton, and thereby enable passengers and freight to go by continuous rail from San Francisco to Bodie and to or near to all the long line of mining districts that reach nearly to the Colorado river.

The Railroad.

The Carson and Colorado railroad is proving to be a great benediction to a large scope of country that, for lack of such advantages, would long have remained unimproved. This road, when completed to Colorado river, will allow the tourist to see the Sierras on the Central Pacific railroad; then, by the Carson and Colorado railroad, from Reno pass through a very pleasant grazing, mining and agricultural country, giving ample opportunity to see Nevada's deepest mines, and perhaps as perfect and efficient mills and hoisting machinery as has ever been erected in any country.

The terminus of this road, at Colorado river, will introduce the tourist to some of nature's grandest scenery. The Grand Canyon of the Colorado above the Needles is a grand climax of stupendous grandeur. The Atlantic and Pacific railroad, that connects at Needles with the Southern Pacific, conducts the visitor to Peach Springs Station, within eighteen miles of the Grand Canyon, where Young & Co. have ample accommodations to make the trip one of comfort and enjoyment, for the 18 miles staging is in a canyon toll road, and one of constant descent and affording many interesting views. This new route through Arizona on the 35th parallel is one that has great inducements for students and pleasure seekers who are crossing the continent. But to return to Bodie. The little staging now required to get there after leaving the town of Hawthorne is not a hardship worth mentioning, even in this very snowy winter, for Cluggage carefully boxes you up in tight coaches, and piles you up with blankets and fur robes, till you feel semi-tropic; and if the snow is too deep for wheels, you are transferred to a sled, and pass on up into the upper clouds where the Pacific coast fogs are all beautifully crystallized, and stored up in vast snow supplies for summer use.

After each installment of these crystals, here called snow, the toll road man goes over the route with a supply of willow brush, and plants them in the snow, as a guide to the driver, just where he must drive to keep over the old tracks far below him.

These guide services are much appreciated. So Mr. Cluggage pays the road company \$3,600 a year toll for their making the road, and thus showing where to hunt for it when lost. It would be an omission too great to overlook the well-equipped foundry and machine works of Messrs. Wells & Co., now engaged on machinery for a new quartz mill, and supplying the various wants and repairs on the works and mills now running. They are prepared to cast and finish very heavy pieces, saving much time, and also utilizing the metal that is already in the camp.

Bodie is Favored

In having a very intelligent population of perhaps 1,000 (though they claim 1,800). The fact that they support a morning and also an evening daily is proof enough of their intelligence, and much evidence that the papers are each live papers, and some would draw a strong inference that the editors and proprietors themselves have much faith that Bodie is not either dead nor about to die, but is to be a brilliant-producing camp yet for years to come. Families remain and endure the winter snows, because they have good schools. The School Superintendent of Mono county, Miss Naomi Angel, of Silver City, Nev., is in charge of one department of the city school, where she is highly esteemed as an able educator.

So I will now leave Bodie in the angelic sphere and go down, down, down, to the warm city of Hawthorne, at the head of Walker lake.

B. W. CROWELL.

CONSUL LAMBERT, of San Blas, has written to warn American laborers that they will not better their condition, but accomplish the direct reverse, by leaving the United States for Mexico, trusting to find employment there.

Smelting Notes from Chihuahua, Mexico.

At a recent meeting of the American Institute of Mining Engineers, Mr. W. Lawrence Austin, of Santa Barbara, Mexico, read the following "Smelting Notes." In the southwest corner of the State of Chihuahua, hidden up in the foothills of the Sierra Madre, lies Santa Barbara, a small collection of adobe dwellings, which claims for itself a history dating back to the middle of the sixteenth century. For many years the mining and reduction of ores have occupied the attention of the inhabitants of this region, but of late interest in these pursuits appears, from some cause, to be lagging. Like every other respectable old ruin, it is haunted by traditions of past glories, and is interesting to the engineer from an archaeological point of view, even if the millions represented to be hidden in its mines do not present to his technical vision the allurements others see. Occasionally the discovery of a pocket of rich ore in the vicinity awakens it from its venerable dreams, and it was such an occurrence that led the writer recently to intrude on its seclusion.

This district was of mature growth, and is lasting in its old age, differing somewhat in this respect from our Western regions. Where the American will move on in search of better things, the Mexican crouches among the ruins. The decadence of the industry here may be traced to several causes, among which are the exhaustion of the docile surface ores; the primitive methods of reduction, which do not admit of operations on an extended scale—in other words, the economical reduction of the ore; and lastly, the lack of systematic development of the mines themselves, which prevents the extraction of these low-grade ores when connected with any serious expense.

The Appearance of the Veins

Is imposing. Huge quartzose ledges, carrying zinc-blende, galena, and the various pyrites as impregnations and seams, cut through the country rock for miles, their jagged outcroppings occupying a prominent place in the landscape. They present some features which might cause the metallurgist to reflect before embarking in any scheme for their reduction. Zinc blende predominates; iron ores are wanting, if we except the pyrites; the local supply of fuel is limited to a certain amount, too small for ambitious designs; the gangue is quartz pure and simple, and the average assay shows a very low grade of ore. Such objections may have been among the reasons why so many of these mines have lain idle these many years; so that now, upon inquiry as to who made the enormous excavations, a shrug of the shoulders, and the response "los antiguos," are all that can be elicited.

Some of the descendants of these mystic beings, more ambitious than their fellows, earn a livelihood by hand-sorting, or concentrating the better portion of what their ancestors left behind, preferring this to starvation; but we did hear a bilious party remark, that had they selected the latter alternative, it would have been the nobler of the two.

The Concentration

Is carried on in what is termed a planilla; that is, a man goes to the brook, or rather to a point where the brook pokes its head up through the waste of the river bed—for, in the dry season, the current is usually bidden from view—levels off a space four feet by four feet on the bank, and paves it with flat stones, giving the whole a slight inclination toward the water. He then surrounds three sides with a wall of other flat stones, set on edge, about twelve inches high, places his fine ore in the upper end, stands off in the stream and bails the water on to the afore-said mineral, throwing it in such a way as to cause the whole mass to be lifted by it. The lighter particles are borne away by the returning current, while those of sufficient gravity remain behind. In this simple apparatus the desired separation of the quartzose matter is effected quite sufficiently for smelting purposes, although there is naturally a considerable loss of the valuable minerals. The greater part of the ore smelted is hand-sorted only, obtained by following the best streaks of mineral in the mines, and selecting therefrom again the most valuable portion.

At present there are twelve blast furnaces in operation in Santa Barbara, each of one ton capacity, but eleven of these are running on ores brought from outlying mines or other districts, and yield, in their concentrated form, 36 ounces to 66 ounces per ton. A smelter of considerable experience in this district assured me, that ores containing less than 40 ounces to the ton cannot be profitably worked, but that as soon as they reach 53 ounces they are in bonanza.

The Largest Works

In Santa Barbara—in fact, the only ones of any consequence—are leased and operated by Mr. A. B. Sawyer, and the following notes are mainly condensed from information furnished within those adobe walls. Here are in operation eleven shaft furnaces and four cupellation hearths, all, together with the buildings, constructed of adobes, *i. e.*, sun-dried brick. These adobes are usually 9 inches by 18 inches, and $\frac{1}{2}$ inches thick, but larger ones are used in covering the cupellation hearths, for instance, which are 30 inches by 12 inches, and $\frac{3}{4}$ inches thick. One man can make about 75 of these first-named adobes in a

day, and is paid 60 cents wages, so that they come to something under one cent each.

The following measures of weight and value will be given in avoirdupois pounds and United States coin. The Spanish pound does not differ enough from the American unit of the same name to make any essential difference in these calculations, and the Mexican copper currency dollar, which alone is in circulation in this district, is calculated, to avoid small fractions, as the equivalent of 80 cents United States coin, whereas in reality it is worth nearly 81 cents.

The Adobes Used in Furnace Construction
Are made from selected clay of a red color, free from small stones. They can be laid in wall at about \$16 per thousand. The furnaces are set in pairs, under hoods or domes about 30 feet high and discharge their fumes, smoke, etc., through their open tops into the working spaces. These domes require for their construction 1,500 adobes, and cost about \$40, independent of the price of the adobes. The furnaces are constructed by building up adobes from the floor to the height of 7 or 8 feet, leaving a rectangular shaft, inclosed on three sides, but with the fourth free. This shaft, from the top downward for 4 or 5 feet, is of small dimensions, and constitutes the shaft of the furnace; below this it widens out. When the furnace is ready for blowing-in, the fourth side of the shaft is walled up, and the enlargement below tamped solid with clay. The bottom of the shaft slopes outward and forms a basin, partially outside the furnace, in which the molten products from the furnace fall and separate. This basin or slag bath is divided by the adobes of the front wall of the shaft, which dips below its surface about an inch. The shaft, when bricked in and ready for operations, has the following dimensions: 4 feet from tuyere to top, 12 inches from tuyere to surface of slag bath, 12 inches square at tuyere and 18 inches square at top. The tuyere ($2\frac{1}{2}$ -inch nozzle) is fitted into a copper plate (18 inches by 29 inches), which constitutes the lower back of the furnace, but usually porphyritic rock is used for this purpose. A pair of these furnaces, from the floor up, require for their construction about 500 adobes, and two days' labor, divided as follows:

Cost of Constructing One Pair of Shaft Furnaces.

One mason at 80 cents.....	\$1 60
Two helpers at 40 cents.....	80
Two boys at 20 cents.....	40
	<hr/> \$2 80
Tamping in crucibles:	
Six men at 40 cents, two days.....	4 80
500 adobes at 1 cent.....	5 00
Clay and smudges.....	1 40
Total.....	<hr/> \$14 00

This represents the total cost of a pair of furnaces, exclusive of tuyeres and copper back (which is not necessary), and divided by two, puts the cost of each singly at \$7.

Operations are conducted as follows: Charges are laid out, each of 150 pounds, made up of 75 pounds of ore and 75 pounds of litharge. With these 150 pounds are charged 150 pounds slag and 45 pounds charcoal, *i. e.*, the fuel is 60 per cent of the ore charges, rather more than less. This whole amount is not charged at once, but doled out in hatfuls to the little furnace. The mouth of the shaft is kept free from sparks. Blast is supplied at $\frac{1}{4}$ -inch pressure (water) for 19 $\frac{1}{2}$ -inch nozzles by a No. 6 Sturtevant fan. Bullion, matte and slag flow continuously into the sumps, separating there; a crust of slag is removed as often as it chills, and the other products are tapped off as often as a new charge is begun.

Oak charcoal is used exclusively, and costs \$8 per ton, pine charcoal being considered too light for the work. From 1,100 to 1,300 tons of charcoal are consumed in these works per annum. From another source I learn that the total consumption of charcoal in Santa Barbara mining district in 1882 was 1,750 tons, which amount represented all that could be produced. This gives an insight into the amount of ore yearly benefited in the district. Accepting, as it is variously estimated, the fuel to represent from 60 per cent to 65 per cent of the ore smelted, we find this latter element covered by figures lying somewhere between 2,700 tons and 3,000 tons, 1,000 tons of which are brought in from other districts.

Cost of Smelting One Ton of Ore.

Labor:	
2 Smelters at 60 cents.....	\$1 20
2 Chargers at 20 cents.....	40
Laying out charges.....	10
Carrying away slag.....	10
Roustabouts.....	20
	<hr/> \$2 00
Fuel:	
60 per cent of ore charge.....	4 80
Total.....	<hr/> \$6 80

This is exclusive of general expenses, blast, repairs and superintendence.

(CONCLUDED NEXT WEEK.)

The mysterious explosion of a very innocent-looking glass ball belonging to a New York gentleman, has called attention to the fact that the bits of annealed glass sometimes found lying about the floor of a factory are dangerously liable to explode, and should not be carelessly handled. They are never sold, but persons sometimes take them away for their beauty's sake.

The Cœur d'Alene stampede is having a visible effect on the trade of Missoula. The *Missoulian* is informed that last week one firm had not a day's sales last month of less than \$1,500, ranging from that sum to as high as \$2,500.

The Cœur d'Alene Mines.

As so many thousand miners are interested in news from the new mines in Idaho, we have collected from various sources the following information:

One man writes to a partner in Leadville and says: "There is no use for any of you boys to come here now. The snow is five feet deep, and it won't be off until the 1st of May. The gulch is all located. On the country all around it flour is worth from \$50 to \$60 per hundred pounds. You can't get any freight taken for less than 30 cents per pound. There won't be anything done until spring. As for the mines, there is nothing certain about them, for the gulch is not open yet. Some gold has been taken out of two claims on high bed-rock. Wages are \$6 per day, and that is all. I will go back in a few days to the mines and do the best I can. I wish I had remained at home until the 1st of May."

The Butte (Montana) *Inter-Mountain* says: It is time that parties going to the Cœur d'Alenes should be apprised of the true nature of the Belknap townsite scheme. It is a swindling enterprise. It is widely advertised as the point from which it is advantageous to leave for Pritchard gulch. The Townsite Company, by newspapers and flaming posters, announces that a first-class wagon road is being constructed on easy grades to Eagle City. On the strength of this information hundreds of people leave the trail at Belknap, intending to start for the mines, and learn only when too late that they will have to lay over one day and then continue down the road to Trout Creek or Spokane. To build a road, or even a trail, from Belknap to the mines, is declared by those who know to be physically impossible. The completion of such an enterprise would cost a million dollars. The Belknap townsite outfit is raising the present excitement merely to sell town lots which are worth nothing for a good deal of money. People who desire to go to the Cœur d'Alenes will find it immensely to their advantage to give Belknap the "go by."

The Walla Walla *Statesman*, which is in as good a position to know as much about the new mining region in the Cœur d'Alene mountains as any other disinterested and impartial newspaper, published in the interior, offers the following reasonable reflections on the subject: As the snow becomes deeper in the new mines reports grow larger in comparison, and the early days of Florence, Boise Basin and Alder Gulch are nowhere along side of it. Previous to winter setting in nothing was heard of the immense riches: Pritchard creek was supposed to contain some gold, but how much was not estimated, as bed-rock in the creek had not been reached, yet no sooner had the frost baked the earth and snow covered it, rendering prospecting an impossibility, than the wildest rumors began to be circulated—and believed by those who knew no better. The *Statesman* has no wish to condemn these new diggings, but at the same time it does not intend to use its influence toward getting up an excitement which will do the country no good. A quail on toast is worth a hundred in the brush, and we advise all who can make a living elsewhere to remain where they are, or untold suffering will ensue. At present there are hundreds of scheming adventurers, whose sole object is to encourage men to go in. As a rule these men know nothing of mining, and readily lend themselves to all the speculators who are interested. If they can write letters to the newspapers so much the better, but as a general thing they dare not sign their names to the letters they write; yet their opinions are paraded in print as if they were old 49ers. A few days since we read in the *Portland News* what purported to be an interview with Platt Burr, in which he stated that one claim owner was so anxious to show him how well his claim paid that he actually shoveled off the snow from his claim for a long distance, set his sluices and cleaned up a large sum. If this ever happened we are willing to wager that if the truth were known the sluices were salted on him, but it is the most improbable thing for a miner to do, especially in the dead of a hard winter, and no experienced miner will be misled by such a statement. When a man has a good claim he does not care to tell about it, but if he has a poor one he may possibly do it, but then he's going to make sure that something is going to come out of it, and "salts" it. We have no doubt that it is a great mineral country, and the possibilities immense, and for that very reason we don't care to see men going in at this early season that can do nothing. They will return disgusted and give the country a bad name, and by their reports keep out good prospectors, and thus retard the development of the mining resources. Nothing can be done until the snow is off the ground, and that cannot be done until May or June next.

Matt Gillespie of Bodie, received a letter from J. M. Ellis concerning the new mines, which is published in the *Bodie Free Press*. Gillespie says: On the morning of the 9th I took my departure in company with eight companions, who were as eager to face the mountains of snow which loomed up in the distance as I was to become a Cœur d'Alene millionaire. We labored hard all day, climbing steep mountains and crossing narrow valleys densely covered with timber and snow, until we sighted

in the far distance what we supposed to be Eagle City, the coveted place, where we arrived at 9:15, and were greeted by acquaintances from nearly all sections of the country, who, like myself, were in search of the yellow dust, but who had already become millionaires "in their minds." On the morning of the 10th I was shown everything that was to be seen. Business seemed to be well represented. I am in possession of some very fine specimens. The placers are only visionary problems to be worked out after six feet of snow disappear. It will take time and labor to expose the untold wealth in the Cœur d'Alene.

A correspondent of the *Oregonian* writes to that journal a very comprehensive letter, from which we make the following extracts:

At Cœur d'Alene everything is hurried and on a large scale of preparation. Stores are going up, with such slight assistance as the carpenters afford, at an astonishing rate, and every man here tells me they will be ready in three weeks to care for and fit out with supplies the 50,000 pushing pilgrims that they confidently expect to see traveling through during the spring and summer. Most of the men here managing investments in stores and hotels have had experiences in other instances of mining excitements in California, Nevada, Colorado, New Mexico and Montana, and they certainly ought to know what they are about. I hope they do. Last night I met Mr. Pritchard, the discoverer of the gold that calls together so many fortune seekers, and had a long talk with him. He said he first found gold in 1878 or 1879, I do not exactly remember which, and that he let into the secret his partner in a hay ranch on Mud Prairie. This led to the letting in of another partner, and the next thing Mr. Pritchard knew Gerard and Gillette appeared in the mountains with Mr. Markson, a stranger. Then he became uncommunicative, and the others began to doubt the presence of gold in paying quantities. I asked him as to the various trails into the mines, and he said there had been much wild talk about all of them. "Of course," said he, "I think this the best way in, otherwise I would not be on my way through Cœur d'Alene with my family; and," he added, "these pack trains you see going through every day will get there in better shape than those who are hunting for a short trail over the mountains." He believes that the Trout Creek trail is a feasible one, but said that it was made to rise fully a thousand feet higher than it need to. The Heron siding trail has been pretty much given up as impracticable, if not impossible, and the new Belknap trail, Mr. Pritchard thinks, will be "soft and impassable," as he expressed it. So far as I can learn by diligent inquiry, their claim that the Northern Pacific Company is aiding and abetting in the Belknap boom is not founded on fact. I cannot find a railroad man who will admit it. The easy ride from Rathdrum here and the steamboat from here to within eight or ten miles of Eagle City will settle the dispute when it comes to undertaking the continuous and heavy freighting that must be done.

Captain Haines, an officer of the fort, told me yesterday that he felt certain that gold in rich quantities would be found on the St. Joe river, a stream which empties into the lake not far from the north fork, up which the steamer will run on its way to the landing below Eagle City. The map issued by W. B. Ayer & Co., of Portland, will give a fair idea of the relative situation of the points mentioned. Captain Haines has been about here several years, and seems to understand the lay of the promised land pretty well. Of course, the finding of gold on the St. Joe would give the glittering prize for sudden wealth an extra glitter.

A practical miner, an ex-resident of Eureka, Nevada, writing to a merchant of that place, says: "Now to the point, and to be brief, the country has not been prospected for quartz, although there have been several locations made, both gold and silver. The specimen gold quartz is very rich. All the quartz claims that have been found are near the trails adjacent to the placer mines. In one or two instances the discovery was right in the creek bed, at a point where the waters have been washing the ledge, then traced to the mountains. It is the unanimous opinion of experienced miners that this will be a great quartz country, and there are many of them lying here for the purpose of being on hand early in the spring to prospect for it as soon as the snow goes off. The placer ground already discovered lies on the two creeks, Pritchard and Eagle. On Pritchard there are fourteen to sixteen miles of placer ground."

STEAM WAGON.—We hear that the steam wagon which is being used by the Lester Mining Company for the purpose of hauling ore from the McCracken mine to their mill at Signal, a distance of nine miles, is working to perfection. This means of transportation has been successfully used in Scotland, and we see no reason why it should not be just as effective in Arizona.—*Mohave Co. (Arizona) Miner.*

The steady development of our mines is a thing that is fixed. We are no longer a people looking for brokers to find us purchasers for mines. We have turned, too, in good earnest, to develop our own mines, and the late disclosures show the wisdom and safety of so doing.—*Pinal, A. T., Drill.*

THERE are 2,000 passengers at Sprague, on the Northern Pacific railroad, snow-blockaded en route to Cœur d'Alene.

THE ENGINEER.

USEFUL INFORMATION

DE LESSEPS AND HIS ENGLISH FRIENDS.

Recent newspaper statements convey the information that M. de Lesseps has come to some sort of an understanding with the English objectors to his plans in relation to increasing the capacity of the present ship canal across Suez. The agreement was made November 30, 1883. The most important points are: To prevent delay in the transit of vessels through the canal, the company will either enlarge the present canal or construct another, and a committee of engineers and shipowners are to be appointed to study this question, half of whom shall be English. To provide for the establishment in London of a consulting committee of the ten English directors, and for the opening of a London office where dues shall be payable; to provide that in future appointments to the Company shall largely increase the number of English-speaking officials. The other clauses abolish pilotage dues, and propose a progressive reduction of the ordinary transit dues, until the minimum of five francs is reached.

A SHIP RAILWAY ACROSS SUEZ.—Dates from Athens of January 10th, says the London *Standard*, state that a scheme has been presented to the Porte by a Mr. de Leon, representing large American interests, which is intended to replace Admiral Ingfield's project of connecting the Mediterranean and Red seas by submerging the Jordan valley. This new scheme consists of the construction of a ship railway, which, starting from El Arish, on the Mediterranean, would have its terminus on the Akaba, on the Red Sea. The actual cost of the line—as it would pass through a perfectly flat country—would not amount to an exaggerated sum, although the expense of keeping up the permanent way, consequent upon the transport over it of vessels of heavy tonnage, may be so great as to render competition, on even terms with its Suez rival, somewhat difficult. In the event of a successful issue of the present negotiations, Mr. de Leon is likely to be rewarded by the American government with a high diplomatic post at Constantinople.

THE ELECTRICAL RAILWAY IN BAVARIA.—The *Schweizerische Bauzeitung* records the fact the first electrical railway in Bavaria was lately put in operation. The railway in question forms a connection between the Breunheim station and the large sawmill of Herr Steinbeiss, and the immediate purpose of its erection was to facilitate the transportation of lumber to and from the mill. The gauge is normal, and the length of the road is about one kilometer (about three-fifths of a mile). The motive power of the locomotive is a Schunkert dynamo-electric machine of four horse power. At night, when the railway is not in operation, the machine is utilized for the lighting of the mill by means of Edison incandescent lamps.

THE HENNEPIN CANAL, which is designed to open steam navigation between the Mississippi river and the great lakes—if it is ever constructed—will be eighty feet wide on the water line and seven and a half feet deep. Congressmen Miller's bill calls for an appropriation of \$1,000,000 to prosecute the work. Some evasive St. Louis writer says that nominally the canal is intended to promote commerce in the Central Western States, but incidentally by it is noticed that it will draw the waters of Chicago's unclean river down into the Mississippi and perhaps save the Garden City the large sum she now pays for pumping.

MEXICAN RAILROADS.—An approaching event of considerable importance is the completion of the Mexican Central Railroad Company's main line to the United States. This event is announced officially to take place about the middle of March. The road will be open for through traffic between April first and fifteenth. The connection by rail of the City of Mexico with the railroad system of the United States is an achievement which will undoubtedly mark the beginning of an era in Mexican progress and prosperity.

THE BALTI SHIP CANAL.—The new ship canal, which is to connect the Baltic and North seas will save nearly six hundred miles of water journey now made around the Danish peninsula. The cut, as proposed, will be from Cuckstadt to Kiel, and the length will be about half of the Suez canal, or some fifty miles. As in the Suez canal, there are several small lakes lying in the way, which will be utilized by the engineers.

ENGINEERING MEDAL.—We notice that the American Society of Civil Engineers has honored Mr. Wm. P. Shinn with the Norman medal for 1883, in recognition of the value of his papers on "The Increased Efficiency of Railways for the Transportation of Freight," and "How Can Railways be Made More Efficient for the Transportation of Freight?"

AN IMMENSE TUNNEL, two miles long and hewn out of solid rock, has been constructed by the city of Boston to carry off the sewage from that city, which has heretofore been emptied into the river and harbor immediately adjoining the business centers, and greatly to the detriment of the public health. This work has cost \$4,500,000.

THE LATEST NOVELTY connected with a ladies' toilet is luminous jewelry. M. Gaston Trouve, the well-known electrician of Paris, has lately designed a series of ornaments for ladies' wear, which consists of glass colored and cut to imitate rubies, diamonds, etc., fitted in an envelope surrounding a small incandescent lamp of low resistance. The light shines through the pieces of glass only, and gives them all the appearance of the stones they are intended to imitate. The lamp is fed from a small battery which is carried about the person. It is composed of three pairs of zinc carbon plates (two carbons to one zinc), or a larger number, according to the current required. These plates dip in a saturated solution of bichromate of potash, which is contained by an ebonite cell with three compartments. The plates are fitted into a cover, which is kept securely down on the top of the cell by two bands of India rubber passed around the whole. Finally, the battery is encased in two sheets of gutta percha, so as to entirely prevent any leakage. A miniature switch is carried in the pocket or elsewhere within reach, to which the battery and lamp wires are connected. The pressure of a finger on the arm of the switch makes or breaks communication with the lamp. The battery weighs (with six plates) 300 grams, and will work about thirty minutes with a two or three volt lamp. A larger battery to work a four or eight volt lamp weighs 800 grams.

THE PRODUCTION OF A GREEN SURFACE UPON ZINC OBJECTS.—In order to coat zinc articles with a permanent light to dark green species of enamel, a solution is prepared by dissolving 50 gm. sodium thio-sulphate in 500 cc. boiling water, and adding thereto 25 gm. sulphuric acid. The sulphur which precipitates is filtered off, in the resulting clear, warm solution the articles to be enameled are immersed. A short immersion results in the production of a light-green, smooth coating of sulphide of zinc. A longer digestion in the above solution at a temperature of from 65° to 85° C. yields a tougher and more shining enamel of a dark gray tint. The articles are then washed in water and dried. The enamel-like surfaces lose their luster and become lighter in color by immersion of the articles in dilute hydrochloric acid. An appearance like that of black marble is easily obtained by applying an acidified solution of sulphate of copper with a sponge. A more brownish gray is obtained by replacing the solution with one of 15 grms. chrome alum and 15 grms. sodium thio-sulphate.—*Cotton, Wool and Iron.*

ROLLERS VS. MILLSTONES.—At a recent meeting of the London (England) Society of Engineers, a lecture on roller milling was followed by an animated and interesting discussion. A practical miller gave notice that a certain power used in his mill produced with burr runs 550 sacks of flour, while the same power was sufficient for 900 sacks since the introduction of rollers. He claimed that the first failures of the roller mills in England were due to the deficiency in the purifying apparatus of that time, and not the rollers. If it is claimed that the burr will successfully compete with rollers, such an assertion is correct for certain kinds of grain. But England has to rely upon those kinds not well adapted for the burr, and a challenge was issued to the advocates of burr stones to produce with it a flour from Indian, Russian, or American spring wheat, as good as that obtained by rollers.

CARELESSNESS WITH BOILERS.—The recent explosion of a boiler in a Rochester, N. H., shoe factory is one of those regularly recurring cases of either criminal carelessness or extreme stupidity which have always been, and we regret to say, very probably always will be, prominently connected with steam-boiler management. One of the daily papers, alluding to the accident, graphically described it by stating that the engineer "hung a brick on the safety-valve lever, with the aim of raising an extra quantity of steam. He raised it; likewise the building." We need add nothing in the way of explanation, and only regret that, after all that has been said about the dangers of overweighing safety-valves, the practice should still be indulged in to so alarmingly great an extent.

THE FANCY GLASS BUSINESS.—At Gaudenfel, Germany, the artist and glass spinner, A. Frenkel, of Vienna, has established his glass business, offering carpets, cuffs, collars, veils, etc., made of glass. He not only spins, but also weaves glass before the eyes of the people. The otherwise brittle glass he changes into pliable threads, and uses them for making good warm clothing by introducing certain ingredients, which are his secrets, and thereby changing the entire nature of the glass. He makes white, curly glass muffs; also ladies' hats of glass, with glass feathers, which are lighter than real feathers. Wool made of glass, it is said, cannot be distinguished from the general article. Glass is a non-conductor, and the time may not be far distant when it will cause a revolution in dress material.

FLOUR MILLING.—The most notable feature of the mill furnishing trade at this time is the increasing demand for larger plants. The pres-

ent small mills have a capacity of from 50 to 150 daily capacity. There are a hundred such mills in the West to one of 500 to 1,000 barrels or greater capacity, and as yet not nearly so large a proportion of them have been overhauled and put in the best shape for work according to the latest ideas. It is evident that these mills must put themselves in condition to do as good work as their larger neighbors, and their owners seem to generally realize it. The result will be large sales of machinery and furnishings, and another active season in the mill furnishing business.

HOW IS WHEAT WINTER KILLED?—An old grain man who has had years of experience in all the important winter wheat growing sections of the country, broached his theory on the winter killing of fall sown wheat in a recent conversation with an exchange. It is to the effect that wheat is winter killed frequently by smothering; that too much snow is worse than too little, and that even a light covering of snow on which a crust has formed is more fatal than hard frosts with no snow at all. Perhaps some of our readers located in the winter wheat sections can shed some light on the subject.

SIXTEEN LEADING INVENTIONS. The following are said to be the sixteen American inventions of world wide adoption: The cotton gin, the planing machine, the grass mower and reaper, the rotary printing press, steam navigation, the hot air machine, the sewing machine, the india-rubber industry, the machine manufacture of horse-shoes, the sand blast for graving, the gauge lathe, the grain elevator, artificial ice making on a large scale, the electro-magnet in its practical application and the telephone.

FRUIT AND VEGETABLES.—There is no absolute distinction between fruit and vegetable, fruit being that part of the vegetable kingdom found growing upon stalks or trees, and containing the seeds, and sometimes being the seed itself, whereas all organic nature not animal is said to be vegetable. In common parlance our soil-grown products for culinary use are called vegetables, and some that are really fruit are also called vegetables. The terms overlap so much by customary nomenclature that distinctions become difficult.

COAL TWO THOUSAND TWO HUNDRED YEARS AGO.—Theophrastus, a Greek writer who flourished in the fourth century before the Christian era, in a work entitled "Book on Stones," describes an earthy substance which would kindle and burn, and which was used by smiths. There can be no doubt that he refers to coal, and that this is the earliest passage in which that substance is expressed or mentioned.

GOOD HEALTH.

Pie-Plant an Unwholesome Food.

It has long been known that pie-plant, or rhubarb, contains in its stalks and roots, particularly in the former, a considerable amount of oxalic acid. According to a recent analysis made by B. W. Damon, Ph. C., as reported in the *Physician and Surgeon*, the fresh stalks of rhubarb contain 0.19, or nearly one-fifth per cent of free and combined oxalic acid.

A year or two ago we undertook some experiments at the Sanitarium for the purpose of determining the effect of this vegetable upon the system when used as food. As the article was used upon the tables of the Sanitarium two or three times a week, we first directed that it should not be used for a week, then made careful examination of the urine of some thirty patients. Crystals of oxalate of lime, the form in which the acid is usually found when present in the urine, were found in a few specimens only. We then allowed the use of rhubarb in the form of sauce for one meal, and made another examination of the urine of those cases in which the oxalate had not been observed in the previous examination. Oxalate of lime crystals were found in abundance in almost every case.

This experiment proves that the oxalate acid found in pie-plant is a substance which cannot be used as food, and must be eliminated. It is also well known that calculi are sometimes formed from oxalate of lime crystals in the bladder, and that the presence of this abnormal element in the urine is often associated with grave disorders of the general system. These facts seem to us to be sufficient to condemn the use of the article as food. During the coming season we shall make still further investigations of this subject, and at some future time report the result.

Long Life.

The subject of longevity is always one of great interest to everybody. "Live forever" is a favorite salutation in some countries. In the old times people found great delight in imagining their heroes gifted with continual life and unending bloom of youth. With what breathless interest one follows Ponce de Leon as he plunges into the wild forests of Florida in the fruitless search for the fabled fountain. With the advance of civilization and the scientific study of disease and medicine, and the better understanding of sanitary conditions and laws,

there has been a steady increase in the average life of the individual. Governments are studying how best to promote length of life. Those who lead sober, peaceful lives, free from all great troubles and strong excitements, are surest of the coveted length of days.

Some time ago the French Government sent a circular letter to all the districts of that country to collect information as to those conditions of life which seemed to favor longevity. The replies were very interesting, but on the whole rather monotonous. The general result was that longevity is promoted by great sobriety, regular labor, especially in the open air, absence of excessive fatigue, easy hours, freedom from galling poverty, a philosophical mind in meeting troubles, not too much intellect, and a domestic life. The value of marriage was universally admitted, and long-lived parents were also found an important factor. A healthy climate and good water were mentioned. All this agrees with common sense, unless the idea that the intellect is a hindrance to longevity be considered unreasonable, and we know that some of the most intellectual men have lived to a great age.

Interesting researches concerning the comparative longevity of men and women in Europe have recently been made by the Director of the Bureau of Statistics at Vienna. From these it appears that about a third more women than men reach advanced age. This seems corroborative of what was said above. Women often live than men lead quiet, regular lives. They have fewer bad habits; are less exposed to strong passions and excitement. —*Potter's Monthly.*

SALT FOR THE THROAT.—In these days, when diseases of the throat are so universally prevalent, and in so many cases fatal, we feel it our duty to say a word in behalf of a most effectual, if not positive, cure for sore throat. For many years past, indeed we may say during the whole of a life of more than forty years, we have been subject to a dry, hacking cough, which is not only distressing to ourselves but to our friends and those with whom we are brought into business contact. Last fall we were induced to try what virtue there was in common salt. We commenced by using it three times a day, morning, noon and night. We dissolved a large tablespoonful of pure table-salt in about half a small tumblerful of water. With this we gargled the throat most thoroughly just before meal time. The result has been that during the entire winter we were not only free from coughs and colds, but the dry, hacking cough had entirely disappeared. We attribute these satisfactory results solely to the use of salt gargle, and most cordially recommend a trial of it to those who are subject to diseases of the throat. Many persons who have never tried the salt gargle have the impression that it is unpleasant, but after a few days' use no person who loves a nice, clean mouth, and a first-rate sharpener of the appetite, will abandon it. —*The Household.*

LAUGHTER.—Laughter is one of the best physicians known, being as necessary as pure air to invalids, hypochondriacs, persons suffering from nervous exhaustion, and those prostrated by business cares and mental worries. He is a gay companion, a foe of gloom and death; for, being a disciple of Moliere, joy, brightness and health accompany him everywhere. His treatment is simple and applicable to all ages. He never makes any charge for his services, and he is always ready to come when sent for. His face wears the brightest of smiles, which are in themselves better than most of the drugs in the pharmacopoeia for curing certain diseases, and his presence is sufficient to rouse the weak and lethargic into new life. Invalids should consult him as often as possible if they would lighten their burdens, make their lives longer and happier, and defy the approaching hand of time, which spares no one from its withering influence. —*Bow Bells.*

WHITE OR DARK FLOUR.—Careful analysis proves more and more conclusively, according to the *Mueller Zeitung*, that it is poor economy to leave the bran and other impurities in the flour, and that the notion about black bread being cheaper than white is simply a fable. One of the best chemists of Austria, Mr. Max Ruebner, states that, independent of its better taste, the white bread is more economical than the black, because a larger portion of it is digested; in other words, a smaller quantity of white bread is needed against a larger quantity of black bread to satisfy the demands of the body. This is not in accordance with the usually accepted theory.

BLOOD IN EVIDENCE.—The danger of toxicological search for blood with too hasty a conclusion has been instanced by Dr. C. Hasson. A man was arrested for murder. Some stains on the blouse were supposed to be human blood, but an examination revealed that the globules from their size were those of the blood of a rabbit. Certain stains on his shirt which had appeared suspicious had been proved to be derived from the dye of the clothing, modified by sweat and atmospheric moisture.

THE TELEPHONE INJURES TO THE EAR.—Some Springfield (Mass.) physicians are speculating upon the influence of the telephone upon the sense of hearing. They have found several cases wherein disease of the ear has been aggravated by using it.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

RICH.—Amador *Sentinel*, Feb. 23: The St. Julien mine has developed such extraordinary richness that it has been concluded to dispense with the hand mortar, that has heretofore served for a mill, and accordingly the one stamp mill of the Tripp mine has been shipped to the St. Julien, and carpenters and millwrights are now engaged in its erection.

ANOTHER RICH STRIKE.—*Dispatch*, March 1: We learn that a body of very rich rock was struck a few days ago in the South Spring Hill mine, near Amador City, at a depth of about 600 ft. The ledge is about six ft wide, and the rock shows free gold in large quantities. There is every indication that this mine will soon prove to be as valuable as its neighbor, the old Keystone.

UPPER RANCHERIA.—George Evans and R. A. Jeffries have completed laying a half mile of pipe to work on the Smith flat ridge. They have a fine prospect. Also Evans and Fitzgerald are about ready to start up their old and faithful claim. Geo. Browning is also piping. As soon as the Volcano ditch is ready to supply water the old town of Upper Rancheria will have the music of three hydraulics. Strickland, Hughes and McCane are under full headway. Glenn & Co. have their claim in splendid shape, with two pipes under way, with a fine bank of gravel in front. Dick Rule is also making a start on his claims and has hopes of finding some more of those lovely pieces, such as this part of the county has plenty.

PLYMOUTH.—Amador *Ledger*, March 1: Everything is bustling in the neighborhood of the new mine now being opened up at Enterprise. The music of hammer and saw, with the ringing chorus of pick and shovel can be heard all day long. Mr. Ballard of San Francisco is superintendent, and Pa. Delaney foreman.

MISCELLANEOUS.—A. L. Stewart & Brother had six tons of rock from their claim below the Confidence, near Butte City, crushed lately, which yielded \$15 per ton. Another crushing of 6 tons averaged \$20 per ton. There is about 25 tons of ore on the dump, which is expected to yield much higher. W. E. Stewart had 2½ tons of quartz from his claim near Big Bar bridge, crushed at Tripp's one-stamp mill, which surrendered \$10 per ton. The owners of the St. Julien have purchased the one-stamp mill of Herman Tripp, and have moved the same from Big Bar to their claim at Middle Bar, where it is now in course of erection. In pushing the tunnel ahead, a new character of ore has been struck. Specimens shown us consist of almost solid yellow sulphurets. They carry little if any gold, but they are taken as indicative of the near approach to another rich pocket. Ore richer than any heretofore encountered, and showing plentifully in free gold, has been struck in the South Spring Hill. The particulars we have not learned.

Butte.

AFTER THE DUST.—*Gridley Herald*, Feb. 27: Frank Martindale returned to town from the scene of his operations at placer mining, Tuesday. His partner, Frank Mack, having deserted him, Martindale's visit is for the purpose of getting some of his acquaintances to go in with him and work the claim for all it is worth. W. H. Jennings, Arch Taylor and J. Brown have decided to "take stock" in the enterprise and will go to the claim in a few days. Brown is a '49er and "saves" the business. Under his instructions we expect the boys will accumulate lots of dust. About a quarter of a mile of ditch will have to be constructed in order to ensure an ample supply of water. When it is finished they will have all the water they can use the year round.

Inyo.

IMPORTANT MINING SALE.—*Inyo Independent*, March 1: Frank Silva has sold to the Southern Development Company of Nevada 1,500 ft in the Sterling mine, the Vasco mine, Sterling Springs and Harbin Springs, in New Coso Mining district, consideration \$10,000. James Oliver has just completed the survey. The Southern Development Company has plenty of capital at its back, and the people generally are glad to see it become interested in Inyo county mining properties. It will stimulate prospecting and induce capital to invest in our mines.

ANOTHER MINE SOLD.—We are informed by parties just down from Bishop Creek that J. B. Swearingen sold to Eastern parties during last week the mine formerly known as the Golden Wedge, in Piute district, for the sum of \$8,000.

BROWN MONSTER.—Work on this mine has been closed down for the present, we understand. What object the owner of this property has for so doing, is beyond our ken, and is certainly a surprise to all who know of the merits of the mine, paying ore in large quantities having been extracted all winter, and there being plenty more in sight.

DARWIN.—Renewed energies are being put forth in this old camp, and men are preparing for work on many of the old mines. A large amount of freight has gone in there the past week. Everybody feels good, and it will be no very great surprise to see a large force of men at work in that vicinity this summer, lively times and plenty of money.

ARGUS RANGE.—M. R. Williams, superintendent of the Argus Range Mining Company, has returned from San Francisco. Work will be pushed on the Company's mines. Some changes are being made in the mill, and it will soon be ready to start up.

Mariposa.

HORNITOS.—Cor. Mariposa *Gazette*: The old Washington mill is soon to be shut up, and although this old mine of 20 years' standing, with so good a record, was closed down on account of the failure of an experiment with some new-fangled mining machinery, after an expenditure of \$25,000, there are still a large number of persons who regard it as one of the best kinds of mines. At the No. 9 their 20 stamps are pounding away as usual. The Gaines mine supplying the ore, is proving itself to be one of the best mines in the State. Mr. Huling, the enterprising owner, is now in the East making arrangements to considerably enlarge his plant, move his mill to the outlet of the Barrett ditch, to run by water power with tramways to all the new company's

mines. The ditch is already purchased and in process of enlargement, and preparations are being made to build the tramway from Quartz mountain to the mouth of the ditch at the junction of Cotton creek and Merced river. Mr. Barcroft of the Enterprise mine already has his mill here, and only awaits good weather to commence its erection; we bespeak for this mine a great future. Further south on the confines of our township, is the old and well reputed Gonzalez mine, and near it the Del Oro, both owned by an Eastern company and being worked by Mr. Houghton, one of our oldest citizens and mining men. We hear it stated that some eastern parties are in treaty for the Brooks mine. I believe this to be an A one mine, and hope to soon record it as a producer. It is on the same belt, about midway between the Gonzalez and No. 9.

Mono.

ANOTHER STRIKE.—*Free Press*, Feb. 29: The strike on the 306 level of the Bodie has been occupying the attention of the stock market for nearly two months now, and no great amount of thought has been given to the Vulcan ledge on the 206 level. This ledge was intersected by a crosscut near the north end of the Bodie mine, and at the point of discovery consisted of two veins, about six ft apart, the easterly vein being about two ft wide of very fine ore, and the westerly about a foot wide. The Vulcan runs parallel with and between the old Bruce and Burgess ledges, to which it bears a strong resemblance in the appearance and character of its ore. A drift was started south on the Vulcan from the crosscut, wide enough to take in both branches of the ledge, and requiring two square sets to take up the space. This drift is now about 50 ft long, the easterly vein continuing to show the large amount of ore. Everything, however, is taken out and milled, the porphyry between the two veins, as is usually the case about our rich ledges, being so strongly impregnated with silver as to constitute good ore. A winze was started on the westerly, or smaller branch of the ledge, and it is now down about 25 ft. The ore has been growing steadily wider and richer as the winze has gone down, and at the bottom it is four ft wide, of as fine ore as any one would wish to see. It is the regular old-time stuff, such as gave Bodie its first reputation, in 1878. As the poorer branch of the ledge has done so well in sinking this short distance, it can only be conjectured what the better branch may be at the same depth. R. K. Colcord, Supt. of the Syndicate, and C. A. White, Supt. of the Champion, took a look at the new development yesterday, and pronounced it a very important one. At the 306 level there is little change in the main upraise. The stopes are yielding rich ore faster than the mill can crush it. In this connection it is gratifying to state that Supt. Irwin, who is now in San Francisco, has obtained a lease of the Bodie Tunnel mill, which has been recently overhauled and is in splendid condition to work, and that Marden's teams will commence to haul ore to it. The Bodie Tunnel mill is of fifteen stamp capacity, nearly new, and has all the latest improvements and appliances for reducing ore thoroughly and economically.

NOTES.—*Homer Index*, March 1: There will probably be not less than 200 men working in and about the May Lundy mine by the 5th of May. This mine ought and can be made to yield several hundred thousand dollars the present year. All it needs is a little well directed development or opening work and additional milling facilities to place it on a dividend footing equal to that of the sturdy old Standard of Bodie. It is the intention of D. E. Jones, Superintendent of the Virginia Creek Hydraulic Mining Company, to start up his works at the Old Mono diggings just as soon as the spring thaw now in progress releases sufficient water from the Virginia creek basin. The vein from which Wm. Mayes and Pat. Donahue are extracting ore, the same that was cut 80 ft in by the Josephine tunnel, west of the Homer group, is proving to be one of great value. The ore vein is now 20 ft wide, and the ore is improving in quality. The outlook is that there will be an unusually large number of prospectors in the mountains to the south and southwest of this place the coming spring. Mike Noonan and Johnny Landy are steadily pushing the tunnel in the Hyena vein in Lake canyon, and with very encouraging prospects. It is expected that Orlando Fuller will shortly return from the other side of the Sierra, and resume work on his Mount Gibbs mines. The hydraulic miners of Mono Lake valley will have an abundant supply of water the coming season. Work was resumed in the Great Sierra tunnel, in Tioga district, last Monday.

Nevada.

GOOD PRODUCER.—*Transcript*, Feb. 23: The last crushing from Eagle Bird quartz mine in Washington township yielded over \$7,000, the mill being a small one. The vein has increased from six to 7½ ft in sinking. The ore shows a good deal of free gold and averages about \$25 a ton. The sulphurets, which near the surface assayed \$360 a ton, assay \$480 in the bottom of the workings. This is a comparatively new mine, having been in operation but a few months; but it bids fair to give large returns to its owners as the development of it is pushed ahead.

WASHINGTON TOWNSHIP.—*Foothill Tidings*, Feb. 29: If Washington township, in Nevada county, were as far off from any place as Cour d'Alene, there would be a rush of miners to Washington township, for the purpose of looking for and locating quartz ledges. But it is of easy access and has an endurable climate, and though it has the gold bearing ledges its pleasantness of situation prevents its being attractive. Again miners have been in Washington township since early in 1850, and a quartz mining boom has not, in all the time since, been very great. Some quartz there has been successfully worked and a number of ledges been scratched a little; but real and good quartz mining, except in one instance, has not been done. There is a good field for the miner and prospector. The fact that the ground has been occupied by miners for many years is nothing against there being rich ledges. We can remember that where the Idaho mine now is, miners walked over the ground for years and did not see the ledge under the surface. There are larger ledges in Washington that are known to bear gold than is the Idaho ledge, and the fact that miners have walked over those larger ledges is not a proof that good paying mines cannot be found there. It is digging, and not walking and talking, that makes a mine.

Plumas.

THE GREEN MOUNTAIN.—*Plumas National*, Feb. 23: From parties from over the ridge we learn that

the Blake chimney, recently tapped by the lower tunnel, is proving better than was expected, and rumors of \$30 rock have been flying around. This is probably an exaggeration, but there is no doubt but that the rock is rich enough, and that a large pay chimney has been opened, which will keep the big mills at work for years. The tunnel taps the ledge to a depth of over 400 ft below the lowest workings, and not only proves the Green Mountain good at great depth, but establishes the fact that the ledges in that section increase in richness as depth is gained. It is a very valuable development for the Green Mountain, and places it on a secure and solid basis.

PROSPECTS WELL.—*Greenville Bulletin*, March 1: In the Halstead mine at Rich Gulch a drift has been run on the ledge fifty ft; at present the ledge is nine ft wide, and samples of ore taken from any part of it prospect well. The representative of the Plumas Eureka Co. at the mine is said to be satisfied with the prospect. A very pretty gold specimen taken from the Riverdale mine, near Quincy, resembles a bunch of grapes.

San Bernardino.

GARFIELD.—*Calico Print*, Feb. 26: The Garfield mine has been put in good shape for operations, with new chute, ore bin, tramway, assorting platform and shed, car track, lodging houses, office, etc. Work is progressing smoothly day and night, with satisfactory results so far as shown in the milling returns. Thirty miners are employed in and about the mine, including eight ore sorters. No sinking has been done below the lowest level—the last tunnel driven in at a depth of 100 ft—except a shaft of 26 ft sunk in the same. Operations in the mine now consist in finding the ore wherever it may exist. Considerable dead-work is accomplished in reaching the ore deposits, but when ore is found it is generally so rich that it pays a good average profit. The indications of finding ore in the mine are as good as they were from the start. Within the past few months 600 tons of ore have been milled that yielded returns on an average of about \$125 a ton, and several shipments to San Francisco of first-class ore gave very rich returns—sometimes as high as \$1,000 a ton. The prospects of the mine are as bright as ever, and under the able and experienced management of James Patterson, the Supt., it will be developed to the fullest extent of its resources, and continue what it is now, a success. The Sue mine is being worked by three men who have struck no ore since they passed through the rich pocket that created so much interest in the mine when it was first opened. Work is still progressing in the Mountain Brow, and it is reported to be looking as well as ever. Messrs. John McCullough & Co. have commenced work on the Buckeye adjoining the Mountain Brow, and the croppings look well enough to cause them to hope they may strike a rich deposit before they shall have proceeded very far.

San Diego.

THE HUBBARD.—*Cor. San Diego Union*, Feb. 26: I called at the Hubbard mine, Banner, and with the Cowles brothers, managers and part owners, went through all the old workings, and also inspected the work of sinking the air shaft which has been so much required at this mine. For several years the lack of an air shaft has kept this property from being among the best paying mines of this section. The new shaft is now down 55 ft. They have about 40 ft more to sink before the connection is made with the old works. Then they will have some pure air to breathe—something never before had in the mine, although parties have been working at it for many years. About three years since the old works were abandoned, the air being so foul and hot that the men could not work. From William Cowles I learn that he expects to make the connection inside of two months. Then this district will have one more paying institution that will not be dependent upon a few inches of rain.

Sierra.

NEARING COMPLETION.—*Sierra Tribune*, Feb. 27: The mill at No. 9 tunnel, of the Sierra Buttes mine, is getting well along toward completion. This will be without doubt the finest built quartz mill in California. The pipe which will convey water from No. 8 tunnel to the mill is nearly all laid.

COMMENCED WORK.—Martinet & Kane have a force of men at work preparing to build a flume and ditch to the proposed mill site at the Kentucky quartz mine. The water is to be taken from the river, about one and a half miles distance from where it is intended to erect a ten-stamp mill next season. A larger force of men will be put at work as soon as practicable. The Kentucky prospects as well as any mine in this district and the enterprising owners have good reasons to expect big things from it.

IN GRAVEL.—The tunnel at the Blue Gravel mine is in fine looking quartz gravel. One hundred and seventy ft of tunnel have been run under the present contract. The contractors have but 27 ft further to run. When that is completed the owners will sink a shaft to bedrock, which it is supposed will be reached in 15 or 20 ft. The mine is situated at an altitude of 6,000 ft. The snow is seven ft deep at present.

PAY GRIT.—Messrs. McFarlane and McIntyre were down from Bunker Hill last week and reported that gravel had been encountered in the Ballarat claim, at a distance of about 300 ft from the mouth of the tunnel. These gentlemen say that it will take several months to open out the mine for profitable working.

PREPARING.—*Mountain-Messenger*, March 1: The miners throughout the county are preparing for spring operations, much encouraged by the water season insured to them by the recent favorable storms; and the gold yield of Sierra will be unusually large this year. Mr. Vanslyke has rented the Hog canyon quartz mill for a year, and as soon as the weather will permit will put it at work on ore from the Maxson ledge. The Kentucky Quartz mine will soon be developed by Martinetti, at Sierra City. Water will be carried from the river for one and a half miles to the site of the proposed ten-stamp mill to be put up this spring. This promises to become valuable mining property.

BLUE GRAVEL.—We hear that the Blue Gravel Co., at Sierra City, are in good looking gravel, that augers well for the future prosperity of the mine. A shaft will soon be put down to bedrock, supposed to be about 20 ft below the main tunnel.

BALD MT. EXTENSION.—The Bald Mt. Extension Co. cleaned up, last Sunday, 183 ounces, \$3,403.80, making a total of \$5,372.37 for the last two weeks' run. The water for sluicing is steadily increasing

these warm days, and Supt. Lawry has increased his working force, picking gravel in the breasts. The indications are favorable for the main tunnel to soon be through the lava flow, there being sillage and large boulders. The prospects of the Extension are growing brighter for a prosperous future. Since the above was put in type we learn that the total gold receipts for February will foot up about \$10,000, and dividend No. 2 will be declared of probably three cents a share.

NEVADA.

Washoe District.

ALTA.—Good headway is now being made in the main east drift on the 2150 level. The material encountered is largely quartz. The west drift on the same level has been cutting some stringers of ore, and the whole of the material encountered is of a favorable character. The machinery is all working well and smoothly. The pumps very easily handle all the water that is coming into the mine when running at but six strokes per minute.

IMPERIAL.—The timbering of the main drift on the 600 level has been finished. It has reached the vein in the old ground, and a north lateral drift is now being run. This drift is at a distance of 572 ft from the Imperial shaft, and is developing quartz yielding good assays. The drift will prospect the Alpha and Eschequer as well as the Imperial ground. All these mines will doubtless soon be yielding milling ore.

GOULD AND CURRY.—The joint Best and Belcher winze down from the 2500 has reached the 2700 level. A station is being excavated at the 2700 level, and is about completed.

HALE AND NORCROSS.—A large working station has been constructed at the 2800 level and a drift started east. This drift is out only a few ft, but it is showing a very favorable formation. The ground is of an open character, showing heavy seams of clay and other material of a kind in which ore may live and wherein an ore body can find space to expand.

COMBINATION SHAFT.—The shaft has now reached the 2800 level. It is to be continued to a sufficient depth for a sump, when a station will be excavated at the 2800 level and a drift started west for the Hale and Norcross. When this is done sinking will be resumed and the shaft continued down to the 3000.

CROWN POINT.—Are again at work with a full force of miners. The mills on the Carson river are all thawed out and running right along. There is now an excellent milling stage of water in the Carson river, and the mills will be able to run steadily for some months—until the water fails next fall.

YELLOW JACKET.—A full force of men is now at work in the mine, and the mills on the Carson river are running to their full capacity. A great amount of ore has been opened up, and there are likely to be no more stoppages for some months.

BEST AND BELCHER.—The joint Gould and Curry winze below the 2500 has now reached the 2700 level, where a station is being cut out, and is about completed. It is in birdseye porphyry. In this rock a substantial station may be constructed.

UNION CON.—The usual progress is being made in east crosscut No. 1 on the 3100 level, and on the 2900 the air-way is in a distance of 60 ft. This airway is for the mutual benefit of the Union, Mexican and Sierra Nevada mines.

BELCHER.—A full force of men is now employed in the mine, and all the ore that the mills on the Carson river are able to reduce is being taken out. A large amount of ore has been opened up in the mine.

SAVAGE.—The ground into which the main north drift on the 2600 level is passing is of a promising character. A good deal of quartz, all of which carries more or less metal, is being encountered.

OPHIR.—Ore is being extracted on both the 150 and 250 levels. On both levels several prospecting drifts are being run. The ground is being thoroughly explored to all points of the compass.

UTAH.—On the 1750 level the northeast drift is still cutting quartz that carries some metal, and which is of promising appearance. Some repairs have been making to the incline.

CALIFORNIA.—The joint station on the 2900 level is completed, and a joint Con. Virginia station is now being cut out on the 2700 level for the purpose of putting in a double hoist.

CON. VIRGINIA.—The station on the 2900 level is completed, and a joint California station is now being cut out on the 2700 level for the purpose of putting in a double hoist.

Belmont District.

PROGRESSING.—*Belmont Courier*, Feb. 23: Work in the Belmont mine is prosecuted with energy. Agent Asa B. Eastwood informs us that the mine is looking well and that good ore is encountered as the work of development advances.

Bristol District.

NOTES.—The furnace has been shut down for short periods during the week in consequence of the pumping machinery giving away. The fue arrester, known in camp as "Jumbo," exploded several times during the week, causing quite a panic among the employees. Some of the boys employed on the upper deck of the furnace have been turning their stomachs inside out, in consequence of the dense fumes from the feed-holes, which lead us to think that the healthfulness of Bristol is a thing of the past. The Day Smelting Co. have reduced the wages of their employees to the standard of the Utah smelters, which is \$4 for furnacemen, \$3 50 for helpers and feeders, and \$3 for outsiders. These rates are altogether too low, considering the amount of labor required of each man around the furnace. The Day Co.'s furnace bids fair to make a long and prosperous run, under the able management of foreman Richard Walsh. Mr. Walsh thoroughly understands the art of reducing base ores to a paying basis, and pointed out to the writer the mistakes made by the Bullionville Smelting Co. in their treatment of the tailings and Day ore, the latter proving so refractory that they had to give it up, some seventy tons remaining on their dump.

Columbus District.

MACHINERY FOR COLUMBUS.—*True Fissure*, March 1: A carload of material for the new mill at Columbus arrived by rail the other day. It consists

of a new boiler, steam drum, mud drum, furnace front and smokestack. The crushing part of the mill, or more properly the pulverizer, is already set up in the old foundry building, where the above material will also be placed. R. E. Doran, the Supt., expects to have everything in readiness to start up about the first of next month. The result of the workings of the new pulverizer are looked forward to with a great deal of interest, as its success will inaugurate a new process of working ores in a cheaper than way that now in use. This will be of incalculable benefit to remote districts where the rates of transportation are so high.

COLUMBUS CON.—Preparations for working on the ore, at various places in the mine, will be completed by the first of the coming week, when the work of extraction will be resumed. The drift from the shaft on third level will soon be in such a condition that a considerable amount of valuable work can be done through it, and from it in the way of prospecting. The seam of ore in the drift started from the south crosscut on the 150 level still continues, and remains about the same as when last reported. The work of sinking the shaft has been discontinued, and the work on the fourth level has been stopped. All the work in the mine is being done on the 150 and third levels.

MOUNT DIABLO.—The work of sinking the incline is going along slowly; thus far about 30 ft has been excavated. This work has been done on the first and third levels. In a day or two the preparatory work will be finished on the second level and an upraise will be started on the incline there.

Eureka District.

A NEW FURNACE.—Eureka *Sentinel*, Feb. 26: Workmen are employed at the Eureka Con. works removing the old No. 1 furnace and are digging out the bed for a new furnace. The dirt taken out for a depth of four or five feet is rich in lead that has stolen through the furnace bottom in the course of years, and will more than pay for putting in a new foundation. When the new furnace is constructed, it will be for the purpose of reducing the speiss on the slag dump. The style and the plan of it have not yet been determined on.

Pittsburg District.

CONTRACT.—*Battle Mountain Messenger*, Feb. 26: Lewis is nearly sure to come to the front again as a bullion producing camp, there being over 500,000 tons of ore in sight in Pittsburg district, which will assay from \$80 to \$500 per ton, and being wet crushing ore it can be reduced at a cost of about \$25 per ton. A contract is about complete, we understand, between the Dahlgren Mining Co. and D. P. Pierce, of San Francisco, to reduce 200,000 tons of ore from the Dahlgren mine. Mr. Pierce is an old Nevada and a thorough mill man, and has leased the Highland Chief forty-stamp mill and will put it in running order by the 1st of March.

Taylor District.

SNOW.—*Cor. White Pine News*, March 1: We have lots of snow, so much that the ore teams of the Argus had to discontinue hauling, and as a consequence the company's mill had to shut down. This also had the effect to knock off several miners. But all this is only a temporary necessity. Every indication here seems good for lively times next summer, and our people seem satisfied with the outlook. They do not hanker after any far off excitements.

Tuscarora District.

THE NAVAJO.—*Times-Review*, March 1: In an interview with Supt. Price last evening, he informed our reporter that he was raising the big pump from the 650 to the 550 level. His reason for doing this is that from the bottom level is too long a distance to raise the water at a single lift, and consequently that economy and expedition demanded the change. He said it would have to be made at any rate in the near future, and he considered the present the best time for its accomplishment, as he was short of sage-brush fuel and would have been obliged to suspend operations on the lower level in the course of a couple of weeks on that account, or else take cord-wood from the mill, which would shorten the supply there, besides proving doubly expensive. The cease of the water flow from the mine necessitates the temporary closing down of the mill. Mr. Price thinks that the water will raise to the 550 by the time the pump is in readiness, which will be in about ten days or a couple of weeks, when the stamps will again be started up. As soon as an additional supply of sage-brush can be obtained, the lower level will be drained again by means of a sinking-pump, and the work of crosscutting for the ledge resumed. The drift is now in 90 ft from the shaft, and according to the surveys, the ledge ought to be within 50 or 60 ft of the breast. The formation is similar to that of the levels above, and consequently it is a reasonable inference that the ore body continues to the lower level.

CHANGES.—*Times-Review*, Feb. 27: There were a number of important changes made in the force at the Navajo mine yesterday. Rube Norton assumed charge as foreman, Frank Leland as chief engineer and F. H. Klaine as night engineer. There were also a few changes made in the underground force. There are various rumors afloat in regard to the reason for the change, but as none of them apparently emanate from official sources, they are probably mere surmises of the authors, who are not directly interested in the matter, and who know but little about it.

ARIZONA.

MATTERS IN MOJAVE CO.—*Miner*, Feb. 26: John McEwan, John Granfield and R. M. Jones are working on the Poverty claim at Cerbat, a new location, and have some six or eight tons of ore out. P. Hach has a carload of ore sorted ready for shipment from the Infallible mine at Stockton. H. S. Carpenter will soon commence shipping ore from the Rattler mine at Chloride, fine galena claim. During December and January last seventy-two carloads of ore were shipped from Kingman, which, including the shipments from Hackberry, will make the total amount shipped from this county in the last sixty days about 1,000 tons. The miners on Stockton Hill are very anxious to have a siding put in opposite their camp, and have sent in a petition to the railroad authorities for that purpose. Parties are offering to haul ore from Stockton to the proposed siding for three dollars per ton, whereas it now costs twice that to haul to Kingman. The McCracken mill is running on tailings for the present. They are pan-

ning out well. There will soon be quite a force of men at work on the Elkhart mine at Chloride. There is a prospect of some of the best property in the San Francisco district changing hands very shortly at handsome figures. The Matilda mining company are putting up their 30 ton smelter about six miles above Planet on Williams fork. There is considerable stir in the old Aubrey and Owens districts at the present time, and a great many new claims are being discovered. Considerable mining property is changing hands at very fair prices, and some of the boys have made small fortunes by recent sales.

FAVORABLE.—*Prescott Courier*, Feb. 27: Never before, since the first settlement of Arizona by white people, has our section had as favorable a season for successful placer mining as the present. In former wet winters, cold, freezing weather generally accompanied the water, froze up the gravel, the sluices, etc., and made washing in the high mountains almost out of question; that is, in the months of January and February; yes, often in March. As water, this year has mostly fallen in the shape of rain, placer miners have been able to continue work from day to day, the result of which is a pretty fair crop of gold. If they have not been able to work in deep places in their claims, they have had plenty or high bedrock upon which to operate. In "dry" diggings, such as Weaver and Placeritas, work has gone on uninterruptedly. The principal gravel diggings of the Prescott region are in Big Bug, Walker, Hassayampa and Black canyon districts. Sluicing and piping are the modes here used to wash out the gold. We place the number of men now working placers in the county at 400, and we are within the bounds of reason when we place the gross yield, per day, of gold, at \$1,000. This is not a large sum, but, as the saying goes, "everything helps." When it is known that our deepest and best gravel deposits are as yet untouched, it is pleasant to contemplate that, for years to come, placer mining in Yavapai county will be one of the county's paying industries. Quartz mining is now a little quiet. Deep snow in the mountains has put a check upon this industry. Still the United Verde and Copper Mountain Smelters have been active, and the Black Warrior mill, as well as that on Groom creek, have been kept at work. Several other mills and works are waiting for snow to melt, when they, too, will start in taking out bullion. Mine owners who ship their ores to Pueblo, Colorado, and Benson, Arizona, have their shifts of men constantly employed taking out good ores. They must be good or they would be unable to meet the expenses of mining, shipping, working, etc. In looking around through the country, more especially at the mining interest, we fail to see anything that is in the least discouraging. Besides mines now yielding, scores of other mines are so fixed that they can be profitably worked when we shall have a railroad to aid us in the business. Take Big Bug district, for instance, or say, for an example, the Dividend, the Ticonderoga, the Galena, Eugene, Belcher and other mines we might name, have paid and are yet big with pay ore. Walker districts' best mines have never yet been fairly tested. The same is true of mines in Bradshaw, Turkey creek, Hassayampa, Walnut Grove, Antelope and many other districts. Give this section a railroad and the intelligent miners, smelters and mill men the road would bring us, and the output of our mines would very soon be the talk of millions of people. Isolated as we are; feebly as we mine and do other work, in the face of great obstacles, our contribution to the world's stock of precious and useful metals has been favorably commented upon, both at home and abroad.

RICH.—*Prescott Courier*, Feb. 25: A letter from Mr. D. C. Thorne, one of the owners of the Silver Belt mine, Big Bug district, says the ore bodies continue large and rich. Mr. Wm. Gavin, one of the owners of the Pine Spring mine, Turkey creek district, was here recently. The mine, he said, is yielding better than ever. Rich ore—horn and native—is being taken from a place on the ledge 400 ft from the first, or discovery shaft. United Verde company's workmen have struck it very rich in the Hampton mine. Silver is now plentiful in the newly discovered ore body. Immense pieces of copper ore are being taken from bottoms of the shafts and cuts in Copper Basin. They come from below the conglomerate, and add new testimony to prove that C. C. Bean has the largest deposit of copper so far found in America. Silver bullion from the Black Warrior mill, is being sent East. The Messrs. Clark are pleased with mines and mill in Groom creek district. We bear good reports from placer miners throughout the county. A large majority of them are making fair wages; the remainder are doing still better.

QUIJOTOA.—*Cor. Tombstone Epitaph*, Feb. 26: On the west side of the Big mountain is located Pie Allen's Quijotoa city, which at present numbers about 50 people. On the east side is Logan City, which has about 400 people and many good business houses; while the town of New Virginia City joins on to Logan on the east, and bids fair to become the principal town. There are no Chinese in the camp. Water sells at four cents a gallon, wood \$5 a cord, potatoes four cents a pound, flour 35 per hundred, all drinks 12½ cents, and the coal oil can be seen floating on the top of the glass; meals every where 50 cents, and nearly everyone eats about once a day, the bill of fare consisting of eggs, ham, steak and fish, all for fifty cents. This is on account of the large number in the business. Messrs. Kibber and Csanade have just received five dry washers, and are putting men to work about three miles from here placing. The artesian well at this place is down 300 ft, and no water. The first water struck hereabouts was found yesterday at a depth of 45 ft, on the Casa Grande road about six miles from here.

COLORADO.

A NEW STRIKE.—*Colorado Miner*, Feb. 26: The Norway is the name of a new discovery. It is located on the western slope of Leavenworth mountain, just opposite the Baltimore tunnel. The ore is a sulphuret and galena, and ran, at grass, from 200 to 400 ounces silver per ton. This is one of the lodges opened up by the grade of the Georgetown, Breckenridge and Leadville Railroad. The fortunate owners are McAyley, Hilyard & Co., and they intend to develop it and see what it is there.

DAILY DISTRICT.—We are pleased to learn of the healthy condition of mining affairs in this district. The Monarch lode, on Red mountain, is looking well. The main adit is 148 ft in length, and is run on the vein. The face of this adit is interspersed

throughout with mineral. It is being pushed forward under the management of W. Ebert. As soon as the weather permits an iron car and T rails will be put on and the adit continued with all possible speed. The character of the ore found in this opening is a bright galena, pyrites of copper and iron. The Garfield Silver Mining Company is the possessor of five other claims, in close proximity to the above, which they intend to largely develop in the early spring.

EAST ARGENTINE.—Mr. A. E. Bonham was down last week from the Cloudland district, and reports it as one of the most promising in the county. A number of the mines are being worked this winter, and continue to produce considerable high grade ore.

HANNA MOUNTAIN.—We learn from Wm. M. Pinckard, the manager of the Hardscrabble mine, that a force of miners is busily engaged in pushing the work of development, and that the prospects are very flattering. Thus far all that has been done is development and exploration work; the owners, however, are much elated over the present condition of affairs, and the work still continues.

LINCOLN MOUNTAIN.—Hanna & Corbet, lessees of the Virginia City mine, are stopping above the middle level on a splendid body of mineral. The pay streak varies from three inches to one foot in width. The first class mills 250 ounces per ton. A drift is being run from the lower level easterly for the purpose of cutting the main ore body, which is some 20 ft ahead.

REPUBLICAN MOUNTAIN.—The Corry City property is more than coming up to the expectations of its owners. The amount of rich ore now in sight in the mine is a sure guarantee of what will be found in this true fissure vein, as depth is gained from the surface. The property is meeting with such encouraging results that the work of development and exploration goes on uninterrupted. The ore body in this mine has been thus far continuous. The new hoisting works at the mouth of the main tunnel are well under way. A force of miners is busily engaged removing the debris from the shaft, preparatory to sinking. The first-class ore ranges from 190 to 300 ounces silver per ton, while the second-class mills from 70 to 90 ounces.

NOTES.—*Georgetown Courier*, March 2: Haggart & Co., in the Buchanan tunnel, on Leavenworth mountain, have a good streak of ore 5 inches in width, which runs 900 ozs. first-class and 350 ozs. second-class, silver per ton. Work will be commenced on the tramway between the Pay Rock mine and mill sometime during the first portion of March. It will be the intention to complete it as soon as possible. Three runs of ore from the Mendota mine last week (Shay & Co's lease) aggregating 26 tons, 1,079 pounds net, returned a total value for silver and lead of \$5,062, being an average of \$190 per ton. Messrs. Pulsifer and Bruce, lessees on No. 5 lode of the Lebanon, had a mill-run, last week, upon 2½ tons of ore, which returned 184 ozs. silver per ton all in one class. The lessees of the Corry City mine will either build a mill soon, or will rent one of Georgetown's idle ones. Major Fulton, who went East a few months ago, is expected to return shortly. His trip east was for the purpose of raising capital to erect concentrating works and develop the mine. Last week was one of the worst weeks this year for doing mining work anywhere, and especially upon Democrat and McClellan mountains. The snow fell in large quantities, and the wind was severe, while the cold during the first part of the week was indeed intense. The water outlets to the tunnels froze up, causing the water to back up to quite a depth within. The snow drifted into the mouths of the tunnels, and it was almost an impossibility for the miners to work. A very small amount of work was done during the week, except to keep the tunnels clear from snow and ice. The miners confined themselves to their cabins, and were kept busy in procuring wood and keeping themselves cosy. It took no little exertion to protect themselves from the piercing wintry blasts that moaned around their cabins, and crept through the crevices in their log structures. They were more content to sit by the fireside than to face the cold and the storm which blew in a thousand white flakes at every opening of a cabin door.

IDAHO.

BAYHORSE.—*Ketchum Keystone*, Feb. 28: Ore and bullion shipments to and from Bayhorse are temporarily suspended on account of the snow. The smelters there have been inoperative since January 17th, but they will start up on March 1st on Ramshorn, Cinnabar, Elkhorn and Noonday ores. The Ramshorn ores require a considerable admixture of lead ore, and this has until recently been chiefly procured by pack-train from the Cinnabar mine on Squaw creek. Since the opening of the Trail creek road leading from Ketchum, regular shipments have been made from the Elkhorn and Noonday mines at this place, by fast freight. The smelters are now but scantily supplied with lead, but the efforts being made to open the Trail creek thoroughfare will undoubtedly be successful before the smelters run out. It is probable that the Ketchum mines will then continue shipments until such time as our own smelting industry is again put in operation.

VIENNA ITEMS.—Another big strike is reported in the Mountain King, consisting of six ft of 100-oz. ore. The Lion mine, the main working tunnel of which is but 200 ft from the Vienna mine tunnel, is supposed to be the same vein and is now developing rich ore bodies. The Solace Co. are working a small force on the Solace mine. It is current that said company, the head man of which is the well-known J. B. Haggin, will put up large reduction works there in the spring. The mines now in operation at Vienna are the Vienna, Mountain King, Solace, Nellie, Elsie and Emma. Provisions are scarce, but the stage company is making every effort to break the roads and will probably put on a fast freight line in a few days. Snow at Vienna is no deeper than on Wood river. There are 75 men in the Vienna mine, 30 in the Mountain King, 15 in the Solace, and 6 in the Lion. The wood choppers for the Vienna Co. have been put to work in the mines. Tom Tague is still hauling ore from the mines to the mill.

SALE OF THE MINNIE MOORE.—*Ketchum Keystone*: The famous Minnie Moore mine, located one mile west of Bellevue, was transferred Monday to Palmer, Bro. and associates, a close corporation of London, for \$500,000. The sale was made by the

owners, Messrs. Miller, Myers, Chaugnaux and Moore, through the agency of Dr. Welch, of New York city. The Minnie Moore mine is located in Galena gulch about one-half mile west of the town of Broadford. It has figured for the past three years as one of the most valuable galena mines in the Wood river country. The mine is excellently situated for extensive operation, and ore has already been developed for a distance of 500 ft. The galena lies in large bodies, and will average in value about 130 ozs. per ton.

THE SMELTERS OUTPUT.—*Ketchum Keystone*, Feb. 26: Figures showing the output of the Philadelphia smelters have from time to time been published in the *Keystone*, and in December an approximate of the year's yield was given. Official reports having since been completed we are now enabled to give the following: The total amount of all ores received at the Philadelphia smelters at Ketchum in the year 1883, was according to official data 15,054,000 pounds, of which 4,760,000 came from the sampling works of Conkling & Moulton, at Hailey, and the balance from mines tributary to this point. The total amount smelted in the same time was 14,854,000 pounds, leaving the balance of crude ore on hand 200,000 pounds. The ore received at the smelters came from 80 different mines, chief among which are the Irwin, Ontario, Elkhorn, Noonday, Davitt, Mayflower, Wolfstone, and the mines of Bulfinch. A large number of prospects shipped ore in 1883 for the first time, and the number in total contributing to the works was more than three times as great as that of 1882. The works closed operations Jan. 3d.

THE MINNIE MOORE.—*Woodland Times*, Feb. 26: A report that seems to be well authenticated comes from Bellevue to the effect that the Minnie Moore, Queen of the Hills and Monday mines have been sold to a party of Scotch capitalists for \$500,000. The sum of \$10,000 was paid down about a month ago, and \$50,000 more were put up during the past 10 days. The parties who negotiated the sale were formerly connected with the Horn Silver mine, of Utah.

MONTANA.

THE ANACONDA.—*Inter-Mountain*, March 1: R. C. Chambers, Supt. of the famous Ontario mine in Utah, and who recently visited the Anaconda while in Butte, says he does not scruple to class the Anaconda as the most wonderful mine he has ever seen. On the sixth level there are seven square sets abreast, 42 ft thickness of vein and no waste. This strength of vein continues, lineally, 1,400 ft or more. It is the same or better on the seventh and eighth levels. May be one ton in ten of this great ore body is first-class, worth, gross, \$80 to \$100. They shipped to England 1,700 tons of this last month in twenty days, and expect to send off 2,500 tons a month in the future. Mr. Chambers thinks there are 200,000 tons of second and third-class ore on the dump, which will average more than 20 per cent in copper.

NEW MEXICO.

SMELTER.—*Rio Grande Republican*, Feb. 26: The Organ smelter is evidently under a cloud. Attempts are still being made to run it, but as the result is not heralded forth it cannot yet be said to be successful. A rumor has reached here that Prof. Patrick is superseded, and that the man who has taken his place will tear down the machinery and re-erect it to suit himself. We all hope and pray that he may be successful; but hope has been so long deferred, that despair is beginning to take its place. Rudolph Ganz, of San Augustine, had an agreement with the Organ smelter people to keep them supplied with charcoal. With this understanding he went to work and made about 1,300 bushels of it, and then reported to the smelter that he was ready to bring it in to them by the wagon-load. The smelter folks told him to send in forty bushels as a starter! A madder man than Ganz it would be hard to find just now.

ORE.—*Las Vegas Gazette*, Feb. 26: Fifteen tons of ore shipped from the Eureka district about two weeks since, has returned upward of \$100 to the ton. The ore was from the Lucky and Jupiter mines, belonging respectively to J. W. Rowland and Murphy & Devine. The ore was reduced by the Billing Smelting Co. at Socorro. Mr. Rowland shipped a lot of ore to Benson a short time since, which returned him over 300 ounces to the ton. The mines referred to are in the Dug Out camp, some three miles from Eureka proper. Mr. Brennan, of Silver City, took \$50,000 out of 900 tons of tailings by running them over vanners. There is said to be more graphite in the Raton mountains, near Trinidad, and at the foot of the Spanish peaks, than in all the rest of the United States. The celebrated Solitaire mine, near Kingston, is at last in the hands of its original owners, the Wilson brothers. The bondsmen of Tabor & Wurtzschach, Crawford & Bradley, failed, and the Colorado men did not procure new sureties before 30 days of grace were up. The Wilson boys will commence work on the mine at once.

OREGON.

MINING NOTES.—*Jacksonville Times*, Feb. 26: More rain is wanted at once. Miners of Josephine county are busy. Klippel & Keaton, of Poorman's creek, and H. D. Russell, of Forest creek, are doing some piping. There is an abundance of water in the Galice creek district, and several miners are taking advantage of it. It is said that E. Canfield, who is prospecting for quartz in the Galice creek district, has discovered a good ledge. The snow in the mountains is melting fast, affording those whose ditches head there considerable water for the time being. There being an abundance of water, quite an area of ground has been washed off at the Cayote creek mines already. A clean-up is now being made. Some prospectors from Eugene City—Mr. Whitney, an old southern Oregon miner, among the number—are investigating the Jackson creek diggings. The miners in the Steamboat district have plenty of water since cold weather ceased, and we expect to hear good reports from there, as considerable mining is being done. A. P. Ankeny, D. P. Kennedy and Vincent Cook have incorporated themselves into the Bunkum Mining Co., to work extensive diggings not far from the Sterling mines. Walter Simmons is working his extensive mines at Galice creek, and has plenty of water for his giant.

Dewey & Co., American and Foreign Patent Agents.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

[ESTABLISHED, 1869.]

A. LUCKHARDT. B. SALAZAR.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials,

MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

Bet. California and Sacramento Sts., SAN FRANCISCO.
ASSAYING TAUGHT.

Personal attention insures Correct Returns.

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of this whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

EDWARD A. RIX,

MANUFACTURER,

18 and 20 Fremont St., - San Francisco

San Francisco Pioneer Screen Works.

J. W. QUICK, MANUFACTURER.

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the Coast devoted exclusively to the manufacture of Screens. Mill owners using factory Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Branton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jacket, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Old Abe Co., Black also Corliss Pumping Engines, 25x60, for Hoisting and Pumping Works, for 2,000 feet deep. Baby Hoists for Prospecting, 4 H. P. to 6 H. P.

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail. **HALLIDIE IMPROVED ORE TRAMWAYS.** We refer to Gen. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. of every form, made of Phoe Iron Works C. H. No. 1 Flange Iron, or Old Steel. Workmanship the most careful. Rivets Hand Driven.

HERCULES SLAYING THE GIANT.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

218 California Street, San Francisco, Cal.

GIANT POWDER

MANUFACTURED UNDER ALFRED NOBLE'S Original and only valid Patents for NITRO-GLYCERINE Powders, which has been and still is of such immense advantages to the Miner, Railroad Man and the Engineer. All other Nitro-Glycerine Compounds are simply imitations and adulterations of the Original Giant Powder. The Giant Powder Company manufacture three grades of Powder, which are the Safest and Strongest High Explosives in the market. The Original Nitro-Glycerine Compound, **GIANT POWDER** or **DYNAMITE**, is acknowledged by all the great chemists of the world as unapproached by any other compound. The Giant Powder Company have acquired the exclusive right to manufacture "NOBLE'S EXPLOSIVE GELATINE," which contains 96 per cent. of Nitro-Glycerine. It is still stronger than Dynamite, and even safer in handling. This explosive was used in constructing the Mont Cenis Tunnel. **THE JUDSON POWDER** is a black Powder owned and manufactured by the GIANT POWDER COMPANY, is from three to five times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it Breaks More Ground, Pulverizes Better, and Saves Time and Money. The only difficulty heretofore experienced by some consumers of this Powder has been that it required more time to get it to the bottom of a deep borehole. This has now been entirely overcome, and our **JUDSON IMPROVED** is now as dry as the ordinary Blasting Powder and runs as freely.

Triple, Quadruple and Quintuple Caps and all grades of Fuse for Sale.

BANDMANN, NIELSEN & CO.,

General Agents, San Francisco, Cal.

The New Mines.

For several years we have not had so much of an old-fashioned "mining excitement" as that now prevailing concerning the Cœur d'Alene mines in Idaho. Interest in these mines is wide spread and thousands are going. It is true that there have been very highly exaggerated stories disseminated; that the country has not been prospected sufficiently to warrant the furor; that it is cold and rough; an expensive region to get to and to live in; that provisions are high, and that there will be ten or twenty even to one claim. All these things are known, yet men will go in spite of them.

We have for some months collected all reasonable information concerning these mines—for and against—and published it from week to week. It is within our experience that advice to men on subjects of this kind is hardly appreciated. The individual probably knows his own business best. For men to give up good claims or good positions to rush off after new gold fields is of course folly; but men will do it. Old prospectors and miners will go if they can possibly do so. We have deemed it our duty, therefore, instead of giving any lectures on the topic of mining excitements, to give what information we could gather for the benefit of those who were looking for it.

On page 178 of this number of the PRESS is a large map, which shows the railroad routes on this coast, and the location of the new mines. By means of this any one in any camp on the coast can see the route he must travel to get to the new mines. The position of the Cœur d'Alene mountains with relation to the line of railroads is also shown. The map is useful as a means of general reference to the railroads of this coast, and the geographical boundaries and positions.

Many conflicting accounts of the new mines come to hand. For instance, three men write to a Portland (Oregon) paper, and sign their names, A. Sunderland, S. Serlye and Matt White, to the following:

"In answer to our many friends we will answer through your columns, giving the facts in regard to the mines as they appear to us or any other men not interested in a whisky mill or some other traffic along the road to catch the honest miners who have been lied to by the traders who fixed for them last fall and have been lying ever since to get a big crowd to come so they can make a few dollars off the travel, which they are doing in good shape.

Without exception it is the most outrageous excitement that has been for many a year, and is bound to ruin many a man. Gentlemen, take our advice and stay away from the mines. If you go in any town or station along the road and express an opinion that you intend to write to the papers and stop your friends from coming they will almost jump you for a fight in a minute. These are facts, and we do not ask any one to take our advice, but come along and see, and if we have not told the truth they can call us a set of liars. But there are hundreds in the mines to-day that express themselves as we do. We do not offer advice to any one except our friends, and to them we say stay at home, and do not be foolish, as we were, to believe every lie you see, because there are nine lies to one truth in regard to the Cœur d'Alene mines."

As to the side gulches, they can be worked a little earlier than the main creeks, but from present prospects these gulches will not average more than \$3.50 to \$4 per day to the man for the year. We have a good many men here that will tell that they make from \$25 to \$40 per day, but when you want them to show you their "prospect," then it looks very slim.

As I stated in a former letter, I have made no locations. As yet I have not seen anything worth while. Unless the quartz shall redeem the camp, I think it will be quite slim here. I would advise no one to come here that is now working.

This seems to be an extensive mineral region, and well enough to prospect in, but it will take time and money to explore it. As regards business, I think the place will be good for a few months in the spring, and as long as the rush lasts—that is with the money brought in, not with the gold taken out of the mines. I am of the opinion that for mining it will be as good a year from this spring, and certainly much safer than now.

John Willman writes to Mr. W. Watkins of Virginia, Nevada, giving his news of the mines. Mr. Willman was night foreman of the Consolidated Virginia pan-mill all the time it was running, and was in the employ of Mackey & Fair ten or twelve years. He left November 13, 1883, and on the 26th of the month reached the mines, where he has ever since remained. The *Enterprise* says he is a good, square, reliable, steady-going German.

I have just returned from a prospecting trip to the north of the Cœur d'Alene river. We found no prospects to justify making locations. As I said in a previous letter, the camp is over-

estimated. This is brought about by the newspapers and men who want to sell out. The railroad organ puffs the mines, and it is the railroad that is making the money.

There is no work being done on the mines; no drains are being run, and no preparations making for spring work. The owners of claims are nearly all on the sell and for very light prices. It will be the first of July before there can be anything done in the main creek, and then they will be in the same situation as last summer, only able to work the rim rock. On the bed of the creek, where bedrock is reached, in my opinion it will not pay more than \$8 per day in any claim on the creek, for working days. As they are only able to work from four to five months in the year, they will not be able to save much money—many of them will not make salt. When it comes to moving so much heavy timber and also strip from five to ten feet of top gravel—handling it three times—it will require a great deal of hard labor.

A correspondent of the *Butte Miner*, in a long letter, says of the Trout Creek trail: The first twenty miles was made in good shape, the trail being in excellent condition and leading up Trout creek on a very gradual ascent. We camped the first night at King Emerson's, who keeps a sort of public inn at the foot of the mountain. Here trouble began. For the first time since we started did we feel in the least fatigued. Those who tell you that it is a small matter to walk over the summit, either know not what they are talking about or have some motive for lying. From King Emerson's till the foot of the mountain on Eagle creek is reached, a distance of about twelve miles, it is "perfectly awful." Of course it is a mere snow trail, and, being looked out and prepared hastily by Messrs. Tone and Hamilton, it is not expected that the best and most even route has as yet been selected. The boys hugged the backbone of the mountain, regardless of elevation or anything else. From where the trail reaches Eagle creek it is about three miles over a level bottom to Eagle City. The whole distance is claimed to be 34 miles, yet in one's imagination it is a long hundred by the time you reach your destination. We made the trip across the trail, however, within two days. It has been made by good walkers inside of 12 hours. The trail is constantly lined with men coming in or going out. We must have seen over a hundred, pulling their grub and bedding on toboggans, to say nothing of as many more carrying their baggage, or having it drawn by dogs on *trais*.

I have looked up and down the creeks for miles, and everywhere find the ground covered with claim notices. There seems to be little chance now for an outsider to "catch on" unless he has a well filled purse. The only claim that has been worked is the "Widow's." I paid a visit to that mine yesterday, but saw nothing but a pile of sluice boxes and the piles of rocks that had been taken out of the small piece of ground worked. The snow covered most everything, and no work was being done.

Separation of Nickel from Cobalt.

EDITORS PRESS:—I have succeeded after many trials in effecting a very good separation of the above named metals by means of potassium zanthate. The difficulty arose from the solubility of the zanthates of both metals in the same solvents under ordinary conditions. The statement of a correspondent of the PRESS some years since, that the cobalt zanthate was insoluble in ammonia was incorrect. My method has enabled me to detect cobalt in the metallic nickel sold by the dealers in (impure) chemicals, which is not bad for a rapid process designed only for the assay office.

I hope soon to perfect a simple method of isolating the two metals from the other constituents of an ore, and finally to make the assay of these troublesome metals almost as easy as that of copper. I reserve particulars until I have finished my experiments. I think I have found a way in which to preserve the potassium zanthate solution indefinitely. I have some which is over a month old, and it is as good as ever.

C. H. AARON.

Prescott, Arizona, March 2d, 1884.

SUTRO TUNNEL COMPANY.—At the annual meeting of the Suto Tunnel Company, on Monday last, the following officers were elected for the ensuing year: President, Charles W. Brush; Vice President, William Johns; Treasurer, London, Paris and American Bank (limited); Secretary, Pelham W. Ames; General Superintendent, C. C. Thomas; Trustees—F. F. Low, William Johns, Thomas P. Stouey, David Cohn, Hugh Marshall, Charles W. Brush and Pelham W. Ames. The Secretary's report shows the total receipt for the year past were \$107,776.07. The balance on hand, after paying expenses, was \$1,502.14. Of the receipts, \$71,515.75 was from royalties, the Crown Point Company having paid \$25,940.25, and the Andes, \$123.75. Fourteen other mines contributed to the receipts by royalties.

A MINE owner who took an expert to his claim that he might take notes in case his testimony would be needed in future litigation, was asked which way he thought the ledge ran. The expert paused a moment, and then replied: "First show me the direction of your side lines. How the dence can I trace a ledge in a case like this until I see your side lines?"—*Georgetown Courier*.

Extra Session of the California Legislature.

Gov. Stoneman has shown a large degree of firmness under trying circumstances in issuing the following call. It is a matter of great moment to all our people, and we insert the remarkable document which speaks so loudly for itself:

STATE OF CALIFORNIA,
EXECUTIVE DEPARTMENT.)

To the People of the State of California: For four years the chief railroad companies of this State have refused to obey the laws imposing taxes upon their property. Legal actions instituted against them to enforce collection, after having been under various pretexts delayed, have lately been terminated by proceedings through which it was practically established that while nothing was legally collectable from these corporations, yet the State was willing to accept whatever they in their discretion saw fit to accord.

The humiliating attitude in which the State of California is thus placed must fill the heart of every public-spirited citizen with regret and mortification, whilst the disturbance of our whole financial system, caused by the repeated and persistent delinquency of the companies, no wise man should willingly permit to continue. More stringent and effective measures for the collection of revenues from railroads are imperatively demanded. The present condition of affairs also demands a change with reference to the regulation of the business of transportation companies.

The system of electing Railroad Commissioners from districts has not given satisfaction. A widespread discontent exists, engendered by a delay in adjusting a tariff of freights and fares. If the results so long hoped for from a Railroad Commission are ever to be attained, it must be through a revision of the constitution and laws on this subject.

Now, therefore, an extraordinary occasion having arisen, I, George Stoneman, Governor of the State of California, by virtue of the power in me vested by the constitution of the State, do hereby convene the Legislature to meet and assemble at the State Capitol on the 24th day of March, A. D. 1884, at 12 o'clock m. of that day; and do hereby specify the following subjects upon which it is assembled to legislate:

First—To propose and submit to the people of the State of California an amendment to section 4 and to section 10 of Article XIII of the constitution of the State.

Second—To propose and submit to the people of the State of California an amendment to section 22 of Article XII of the constitution of the State.

Third—To propose and submit to the people of the State of California an amendment to the constitution of the State by which the Railroad Commission as now existing shall be abolished, and in lieu thereof a Railroad Commission, to be composed of three commissioners, shall be created; said commissioners to be appointed in such manner as may be provided by law from the time of the adoption of said amendment until the next general election, and then to be elected at said election from the State at large; and to prescribe the term of office, duties, authorities and powers of said commission.

Fourth—To enact all laws necessary for the assessment to and collection from all railroad corporations or companies, doing business in this State, of income taxes.

Fifth—To amend or repeal any or all existing laws relating to revenue, and to enact new laws relating to the same.

Sixth—To propose and submit to the people of the State of California an amendment to the constitution of the State to the end that all property belonging to railroad corporations may and shall be assessed by the State Board of Equalization in the same manner as property belonging to individuals is now assessed by local assessors; and that mortgages and deeds of trust, contracts and other obligations by which a debt is secured, covering the property of railroad corporations, shall, for the purpose of assessment and taxation, be deemed and treated as an interest in the property affected thereby.

Seventh—To enact laws providing that the property of railroad corporations or companies may and shall be sold for payment of delinquent taxes in the same manner as the property of private persons is sold under the same circumstances.

Eighth—To enact laws providing that no writ for the prevention of the collection of any revenue, or to hinder or delay the collection of the same, or to prevent or interfere with the sale of property for delinquent taxes, shall in anywise issue, either injunction, prohibition or any other writ or process whatever; but that in all cases in which, for any reason, any person shall claim that any tax paid by him was illegally or wrongfully levied or collected, he may recover the same by action.

Ninth—To enact laws providing that whenever property is sold for delinquent taxes, a receiver may, upon application of the purchaser, whether said purchaser be a private person or the State, be appointed by any competent court to take charge of the same from the day of the execution of the certificate of sale.

Tenth—To enact a law declaring that the people of the State of California have not authorized and do not ratify any compromise nor any judgment heretofore rendered by consent in any action or proceeding for the collection of

revenue by which a less amount is or has been received or recovered than the sum due by law or claimed in the complaint in the action in which said judgment was rendered for the tax, interest and penalty, and providing means for setting aside said compromises and judgments; and to enact laws more clearly defining the powers and duties of the Attorney-General, District Attorneys and Boards of Supervisors with reference to the collection of delinquent taxes.

Eleventh—To propose and submit to the people of the State of California an amendment to the constitution fixing a maximum rate of charges for the transportation of passengers and freight on all railroad lines in the State, and for that purpose to classify railroad lines according to length, gauge or income.

Twelfth—To enact laws for the prevention of and punishment for discrimination, and for the reform of abuses in railroad transportation.

In witness whereof, I have hereunto set my hand and caused the great seal of State to be affixed, at office in the city of Sacramento, this fifth day of March, A. D. 1884.

[SEAL.]

GEORGE STONEMAN,
Governor.

Attest: THOS. L. THOMPSON,
Secretary of State.

Aluminum.

Soon after Deville succeeded, more than twenty-five years ago, in obtaining aluminum on the large scale from its chloride by the use of sodium, on the principle introduced by Wohler, various methods were suggested for obtaining the metal by substituting other reducing agents for sodium, and by means of electrolysis. These attempts were scattered through the years 1856, 1857, and 1858. Since then, excepting an occasional effort in the direction of electroplating, the industry, if it may be called so, has remained substantially as Deville's experiments left it. The other processes have not been practically successful, and the inherent cost of the sodium method appears to have been a serious obstacle to the use of aluminum in the arts.

Some revival of interest in the production of this metal has recently arisen in England, where it is stated a process has been invented by which aluminum can be produced so cheaply as to make practicable its speedy application to the purposes for which its properties peculiarly adapt it. The descriptions of this process, unfortunately, as given in the journals, do not warrant such an inference. According to these accounts, it consists in obtaining alumina from alum or hauxite, then converting the alumina into aluminum chloride, and finally reducing the metal by sodium. The steps of the process, if the description given in the papers is correct, are substantially identical with those described by Deville in his book, "De l'Aluminium," Paris, 1858, and the expensive sodium is the reducing agent.

The retail price of aluminum is reported at \$1.25 per troy ounce. The quantity of the metal sold in this country in 1882 was inconsiderable. Its use is confined to the manufacture of light weights, parts of mathematical instruments, and similar articles.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MEDICAL COMPOUND.—George Taylor, Redding, Cal. No. 294,288. Dated Feb. 26, 1884. This is a compound which is especially useful in the treatment of diseases, such as rheumatism, neuralgia, toothache and nervous complaints. The compound is vegetable in its nature.

SOFA BED.—Wm. A. Clark, S. F. No. 294,198. Dated Feb. 26, 1884. This invention relates to the class of sofa beds in which the ends or heads, which are fitted to the main body frame, are adapted to have an adjustment between a horizontal and vertical position, and intermediate inclination. The invention consists in the novel connection between the heads and body frame, whereby this adjustment is effected.

THE NEW YORK *Sun* says: "Now that the layers of tin ore in Harney Peak district of the Black Hills are practically inexhaustible, and black tin, which costs now from \$350 to \$400 a ton, can be produced at the new Dakota mines for less than \$40 per ton, and keeping in view that we import something like \$25,000,000 worth of tin every year, and that with the growth of the canning industry the consumption is constantly increasing, the importance of the discovery becomes self-evident."

THE FEBRUARY PAY-ROLLS.—At the Consolidated Virginia office yesterday, Secretary J. M. Taylor disbursed \$13,005.75 to the employees of the Consolidated Virginia, California and C. & C. shaft, and \$9,057 to the employees to the Union shaft. At the Ophir office Secretary W. S. Bender paid out \$26,596 to the employees of the Ophir, Mexican, Union Consolidated and Sierra Nevada, and Superintendent Lyman, at the Utah, distributed \$2,891.50 to the employees of that mine.—*Virginia Enterprise*.

AMADOR claims to have in the Plymouth the heaviest gold producing mine in California,

ERICSSON and RIGER HOT AIR ENGINES.
R. HOE & CO.'S CHISEL TOOTH SAWS.
SIGHT DROP CYLINDER CUP.

WE ALSO CARRY IN STOCK:

Shive and Waters' Governors, Best Eastern Leather and Rubber Belt, Emery Wheels, Packing Waste, Etc.

MACBETH'S —PATENT— STEEL PULLEY.

Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.
They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.
On account of their great lightness and the form of the arms, they absorb less power than any other pulley.
They are the only pulley of the kind which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited),
LEON, ENGLAND, NOV. 5, 1883.

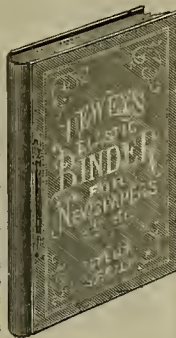

N. Macbeth, Esq. Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed] RICHARD T. MARSH,
Managing Director.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

ASSESSMENT NOTICE.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador county, near Drytown, California.

NOTICE is hereby given, that at a meeting of the Directors, held on the 30th day of January, 1884, an assessment (No. 44) of three (3 cts.) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 12th day of March, 1884, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 10th day of April, 1884, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHLEY, Secretary.

OFFICE—No. 402 Front Street, Room 8, San Francisco, California.

DIVIDEND NOTICE.

Economy in space and fuel. Safety at high
pressures. Freedom from scaling. Equally
adapted for power and heating purposes.
Especially adapted for mills, factories, hotels,
stores or any place where safety is a necessity.
Will work well with muddy water and any kind
of fuel.

TESTIMONIALS.

St. Louis, Mo., Sept. 23, 1883.

Messrs. Adolphus Mier & Co. GENTLEMEN:
We cheerfully certify that the "Heine Patent
Safety Boiler" put up by you in our establish-
ment has proved very satisfactory in its working.
The chief points of excellence in the "Heine
Safety Boiler" are its economy in fuel and space,
freedom from scaling, aptitude for power and
heating purposes, working equally well with clear
and muddy water. We warmly recommend it to
all using steam machinery. Yours truly,
ANHEUSER BUSCH BREWING ASS'N.

OFFICE OF SUP'T OF ROYAL RAILWAYS,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to
your inquiry of September 2d, we respectfully in-
form you that the three boilers built under your
patents, under steam since September 25, 1881, at the Alex-
ander Platz Depot, as well as the two at Friedrich Strasse
Depot, under steam since September 22, 1882, have given
good satisfaction, requiring no repairs whatsoever to date.
The internal cleaning of the boiler was always accomplished

with ease on account of the convenient arrangement of the
tube caps, the adhesion of scales being fully prevented
thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

A detailed illustration of a mechanical device, possibly a pump or engine component. It features a large, dark, teardrop-shaped flywheel on the left, connected to a central shaft. The shaft extends to the right, where it is connected to a complex assembly of gears and pistons. A long, thin rod or lever is positioned vertically above the central shaft. The entire device is mounted on a base with the text "WILLIAMS & PATON ENGINEERS" visible at the bottom.

A detailed technical illustration of a steam-powered traction engine or portable engine. The machine is shown from a side profile, facing left. It features a large horizontal boiler mounted on four heavy-duty wheels. A tall smokestack is positioned at the front. The engine mechanism, including the cylinder, piston, and various connecting rods, is visible on top of the boiler. A large flywheel is prominent on the side. The entire unit is mounted on a sturdy metal frame. The illustration is a black and white engraving, typical of technical manuals from the late 19th century.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

SAN FRANCISCO, CAL.

New Book on Assaying Gold & Silver Ores.

By C. H. AARON.

For Practical Workers.—\$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent.

He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals;

Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 232 Market street, San Francisco.

N. B.—This is Part I of three volumes on assaying by the same author. To be followed by Part II—Gold and Silver; Part III—Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Snow Slides.

During the recent storms prevailing in the mountainous regions several snow-slides have occurred which have occasioned loss of life. This has mainly occurred among the mining population who live at high altitudes. In this State several snow-slides have occurred which have destroyed property, but no life. In Utah they have had a bad one in a locality famous for such disasters. On Friday night, the 7th inst., at 6:30 o'clock, a snow-slide half a mile long, extending from Summit down to Alta, swept away the works of the New Emma mine, killing Gus. Leyhecker, foreman; D. D. Wasson, machinist, and his brother; Samuel Prethero, Charles Colgreen and wife, Edward Croket, Lottie Meon, O. J. Johnson, N. S. Delano, Willard Stephenson and John Richardson. It was the worst slide ever known in Little Cottonwood, the snow piling forty feet high. The damage to the mine is \$15,000. The storm is too bad to bring the bodies down. Several of the killed have families. All the bodies found prove to be horribly mangled, owing to the immense weight which fell on them. The entire shift of the Emma mine buried, had to tunnel thirty-five feet through the snow and ice to get out. None was hurt. It is now learned that all the victims were standing round the boiler previous to going into the tunnel to spend the night.

A dispatch from Denver, Colorado, dated the 11th, says: At 6 o'clock yesterday evening a snow-slide descended on the little snow-bound station of Woodstock, on the Branch South Park railroad, 75 miles southwest of Leadville, carrying away every building in the town, including the railway station. Seventeen persons are known to have been caught, including Mrs. Doyle, a widow who kept the station, and her six children; another woman (name unknown) and ten section men. Two women were rescued last night alive, but seriously injured. The body of one section hand was recovered this morning. No others can escape alive. As soon as the news reached Pitkin the fire bells sounded the alarm, and a large number of citizens started on snow-shoes for the scene of the disaster. Among the missing are Jasper M. Carwell, of Tomish, J. Brown, telegraph operator at the station, George Alexander, Horace Alexander and Mike Shea. A large number of snow shovellers will leave in the morning.

The snowfall in the mountain districts of Colorado the present winter is without parallel in the history of the State. Many mining camps in the west and south have been snow-bound since November. San Juan county is the greatest sufferer. Durango, Silverton and Rico, containing from 1,000 to 5,000 inhabitants, are still blockaded, no teams having reached either town for several weeks. Breckenridge, 50 miles north of Leadville, is nearly destitute. Montezuma, 10 miles distant, is in a pitiable condition. Gunnison, situated four miles from the largest coal mines in the State, is suffering from a coal famine. The snow is eight feet on a level over the whole country, and in ravines and gulches is from 50 to 100 feet deep. The only means of communication is by snow-shoes, and few men are heroic enough to brave the bitter storms. When the spring thaws move the mountain snows, fearful results must follow.

PEOPLE are leaving many of the mining camps of this State and Nevada for *Coeur d'Alene*.

Retorting Gold and Silver Amalgam.

The engraving on this page shows an improved form of retort and condenser for retorting gold and silver amalgam. Several sizes are made. The retorts are turned smooth inside, and are of a shape peculiarly adapted for rapid and complete work.

The cut represents a retort for gold or silver amalgam, where the capacity required exceeds 1,200 ounces. They make several sizes of this design, of capabilities from 150 to 1,200 pounds, troy weight, of amalgam when two-thirds full. They are made so that when the lower part becomes blistered or burned they can be turned over, ensuring a double life. These forms of retorts and condensers have been adopted from designs furnished the Joshua Hendy Machine Works, in this city, by Messrs. Ribon & March, of Jersey City, New Jersey. The condensers are built from new designs, and deliver the

IMPROVED RETORT AND CONDENSER FOR SILVER AMALGAM.

quicksilver, as is shown in the cut, directly into the flask without handling or loss. The engraving is self-explanatory.

BAD MINE WATER.—At the Osbiston shaft of the Gould & Curry mine, on the Comstock, a line of 2½ inch compressed air-pipe has been put in from the surface down to the Sutro tunnel level. The water eats the pipe out quite rapidly, owing to the great quantity of mineral matter it holds in solution. At the joint winze the water is very acid. It eats the tar off the ropes, and so corrodes them as to make it necessary to very frequently put in new ropes. A drop of the water falling on a piece of iron or steel at once produces a red stain. It is also very painful to the eyes of the miners, smarting intolerably and causing much inflammation.

At an extraordinary meeting of the Eberhardt & Aurora (White Pine) Company held in London, it was agreed upon that prospecting in the mine should be pushed with air drills, and \$100,000 should be raised for that purpose. The capital of the company is to be increased to £250,000 by the creation of 40,000 new shares.

A Drill Hole Cleaner.

Among the mining appliances recently devised is a piece of mechanism intended to facilitate the removal of sediment from the bottom of drill holes. It is a tube provided at its lower end with a series of sediment-receiving cups, and connected with an air compressor, so that when the tube is passed into the drill hole the compressed air or water issuing from the bottom of the tube forces the sediment upward, which sediment, when dropping back again, falls into the cups which can be emptied when the tube is withdrawn from the drill hole. The sediment cups are made adjustable on the tube, and the lower end of the tube is provided with apertures or recesses for the escape of the compressed air.

At the upper end of the tube, or rather connected with the upper end of the tube, is a small air-compressing cylinder. A flexible tube

connects this compressor with the tube reaching into the drill hole. The cups on the tube are funnel-shaped, and are arranged one above the other.

The operating tube is placed in the drill hole and the piston of the air compressor is worked. This compressed air escapes through the lower end or side openings of the tube, below the cups, and carries the sediment upward. The sediment falls back again and the greater part is caught in the cups. The tube is withdrawn and the cups emptied. This operation is repeated until all the sediment or pulverized rock is removed from the drill hole. The drill-hole cleaner is expected to operate as well under water as in a dry drill hole.

It is reported that the nickel mines in Cottonwood canyon, Nev., have been sold to an Eastern syndicate for \$125,000. The people of Lovelock hope the report is true, as the development of those mines will be of great benefit to that section.

THE flow of water from the Sutro Tunnel is \$,552,000 gallons per day.

Blasting in Coal.

In Europe one of the consequences of hard times among coal miners has been a reduction in the quantity of explosives per cubic yard of rock removed. It has long been evident that excessive quantities were employed, but it needed the irresistible influences of a narrow margin for profits to correct the fault which has existed ever since the adoption of stronger explosives than gunpowder. With regard to the use of compressed lime, to which we have before referred, experiments were recently made at Woolwich Arsenal, on behalf of the Royal Commission on Accidents in Mines, by Prof. Frederick Abel. During the experiments great care was taken to obtain, as nearly as possible, the same conditions as would exist in the case of a pent up charge where hardly any expansion can take place, so as to ascertain the highest possible temperature that could be produced. For this purpose there were provided heavy iron cases representing shot holes, 3 feet 6 inches deep. These holes were lined with wood, so as to intercept the heat, which might otherwise have been absorbed by the iron. The holes were then loaded with a full charge of compressed lime cartridges, and "tamped" (stemmed) similarly to a shot hole in coal. After pumping in the proper quantity of water, the maximum heat was ascertained in various parts of the charges by means of specially constructed thermometers, and by the introduction of various metals, the result being that in no case did the heat reach the melting point of lead. One of the inventors of the patented compressed lime cartridge states that steam attains a pressure, within three and a half minutes after the water has been added, of upwards of three tons to the square inch. He also states that the cartridges are prepared at the manufacturing of the company of an exactly uniform degree of causticity, and are, without inconvenience, preserved in an unaltered condition for any length of time, until the moment of charging the holes. Thus their efficiency is not altered in the least degree by the humidity of the atmosphere. An interesting proof of this was given a short time ago at the Shipley collieries, when, in the presence of several mining engineers, some shot holes were charged with cartridges made twelve months previously, and which had since been on a voyage to America and back, when they proved to be as quick and efficacious as others which had been made the same morning.

THE bulk of the travel on the N. P. bound for the *Coeur d'Alene* mines, is from the East to Belknap. The railroad hands say that Rathdrum is being so "boomed" in the East as to catch the trade and the travel. The wagon road from that place to Eagle City is being pushed ahead rapidly and will be completed in a few weeks. Wagons can carry fair loads in towards the mines as far as the road extends, and upon the completion of the thoroughfare a line of six-horse stages will make daily runs between the main N. P. track and Eagle City.

THE bullion product of some of the Comstock mines for the last quarter of 1883 was as follows: Andes, \$1,622; Belcher, \$46,326; Crown Point, \$157,931; Kentuck, \$86,801; Lady Bryan, \$1,800; Mount Christo, \$11,379; Ophir, \$32,977; Potosi, \$54,104; Savage, \$1,358; Union Con., \$5,065; Yellow Jacket, \$73,027; total, \$473,390.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eos.

The Harris Mines, Washoe.

[From our Traveling Correspondent.]

On the hills to the east of Washoe lake and Washoe valley, Nevada, some gold and silver ore was found in the early Washoe days, when the whole country was being searched to find ore that looked exactly like the Comstock ore. A district called Argentum was formed, the name since then having been changed to Washoe district. In 1860 to 1863 there was considerable excitement in this section, but at that time anything that failed to look like the Comstock ore was not worthy of much attention. Silver ores were desirable; silver mines were said never to fail or to be worked out; "gold seekers often died poor men." So after a small amount of surface scratching, many of these locators hastened off to some other excitement; and it so happened that this particular portion of Washoe district, where now is located the Harris gold mine and the Bessie Kirby silver mine, was almost entirely overlooked in that early prospecting. The Old Post, about half a mile away, was worked between '60 and '67, and tunneled about 900 feet. The Buckley Co. also did much work, running a tunnel over 800 feet, but by misdirection of their work they left the ledge pitching over them.

In 1882, Mr. Harris, a Gold Hill assayer, was out hunting jack rabbits, and happened while passing this old Washoe district to feel inclined to take a rest. While sitting, he saw a piece of float rock that glittered with gold and assayed \$26,000 per ton. Notwithstanding it looked so little like Comstock, he felt some slight anxiety to get another piece from the same ledge, and soon forgot his lost jack rabbits and centered his search for the hidden treasure, which resulted in finding in an incline shaft a small vein of fine specimen ore, a feeling broken off from the main ledge. On going below and running a tunnel, at 40 feet he struck a small ledge of silver rock, showing

Native Sheet and Wire Silver,

Some of the best samples assaying as high as \$1,700. Following the incline of this ledge down 36 feet, and then drifting on it under the mountain to cut the gold ledge found above 150 feet in that direction, east, in the silver lead, on reaching the point where the two ledges intersected each other at right angles, he found it all there changed to a gold lead, and showing good milling ore of the average value of \$200 per ton.

Since then he has run an incline from where it was struck in tunnel or lower drift from the incline, and while sinking the incline 70 feet, ran two crosscuts, one in the middle of incline and one at the bottom of it, the cut from the middle showing the better ore and a large body of it, considering its richness, four to sixteen inches, and worth \$3,000 per ton. This drift was filled up securely for the protection of the rich specimen ore there exposed. The bottom drift was also cutting the vein in good ore of lower average grade, from \$100 to \$3,000 per ton. There is not much specimen ore at this part of the ledge, as it is not yet into that strata containing the best specimen ores. It seems to be Mr. Harris' intention to explore his ground to prove something of the extent of his bonanza ore before erecting any reduction works. His expense money was easily produced by pounding up a few specimens in a hand mortar as needed.

A lad in Virginia City wishing to add to his Christmas funds, took about \$50 from a small specimen of this Harris ore. The present owners are E. W. Harris, D. Allen and J. C. Dunlap, the last owning each one-eighth part. The intersecting ledge of silver is called the Bessie Kirby, in honor of Dr. Kirby's daughter, of Virginia City, a little girl of eight summers, niece of Mr. Harris.

Marker & Smith hold the east extension of the Harris mine, and are drifting to strike the specimen ore, and were having encouraging prospects. The west extension is held by Joseph Douglass of Virginia City and B. F. Leet of Reno. Are sinking a shaft, and have erected a house and stable.

The Cowboy, higher on the hill, have a shaft down 70 ft.

The Washoe Giant is a strong out-cropping ledge of gold and silver, giving an assay of \$40 and upwards from the surface. They are running a tunnel to strike it below.

The old Buckeye, owned by Carsonites, was expecting to start up soon in earnest, as they have in their 700-ft. tunnel some good ore that was found in the early Washoe days, when it was opened, and 500 tons said to have been taken out. Five tons of surface float rock, taken last year, and worked at Gold Hill, gave a pulp assay of \$206 per ton.

There are in all about a dozen locations made in the close vicinity of the Harris mines, and with good encouragement for sanguine expectations.

About one and one-half miles to the north Messrs. Jackson & Milsap have a large ledge of 10 feet carrying silver and gold, and was also suspected strongly of being rich in nickel, but had not yet been assayed for that metal.

The Various Developments

Here almost give certainty that with the opening spring there will open up a nice little mining camp of Harrisville, at Washoe Lake, which is

about three miles from the mines and the nearest water, and near the railroad depot. Just across the valley are the old timber lands, stripped of the best lumber, but yet having abundance of wood and timber for milling and mining purposes. Virginia City can spare many dwellings, and some of her citizens may take advice and "go west." Washoe valley contains several fine ranches, and dairies are found to do well. Theodore Winters seems just in his element here raising horses and cattle, and a few hundred milch cows handled by Swiss dairymen under his direction for butter and cheese, which have a very quick sale at gilt-edge prices at Virginia City.

The famous Sandy Powers' mansion, now owned by a Reno capitalist, is rented out, and shows years of neglect, and leaves a strong impression that there was more money than brains when this monument was erected. Washoe Valley, though cold, is a healthy location, and some who have been there a long time think it preferable to the climate of California.

There are several families yet residing in Washoe who were there in 1860, and seem to enjoy most excellent health and have acquired a moderate fortune by farming there.

B. W. CROWELL.

The Cœur d'Alene Mines.

From an extended letter in the Butte (Montana) *Miner* we take the following statements concerning the new mines: Notwithstanding the "ravages of the elements," I lost no opportunity to gain what knowledge I could concerning the mines and their future. I will first treat of

Eagle Creek,

From its source to where it empties into Pritchard creek. But I would state before going further that Eagle creek is considered the main stream and that Pritchard joins it at Eagle City. This is certainly wrong, for Pritchard is a much larger and longer stream, and runs directly westward to the north fork of the Cœur d'Alene river, while Eagle is a short, small stream and runs nearly in a southerly direction to Eagle City, where it intersects Pritchard almost at right angles. Why the stream below Eagle City is called Eagle creek is one of the mysteries I am unable to solve. Eagle creek about three miles above Eagle City forks, the ground along the main stream and each fork for perhaps two miles all being taken up. Whether these locations will pay is a question, as they have never been prospected to any great extent. So it will be observed that it is all speculation as to the mines on this creek. I am inclined to the belief that there will never be found pay dirt on this creek. Possibly its north fork may turn out a few paying claims.

Now we will go to

Pritchard Creek,

Commencing at its source in the mountains, or as far as it is located, and trace it to its confluence with the north fork of the Cœur d'Alene river, distance about 20 miles. At, or near its head, we find a location of ten acres made by Johnnie Miller, formerly a hardware clerk of Butte, and at present the city recorder of Murrayville, and deputy district recorder under Judge Claggett. He, in common with many others, knows not whether his claim contains pay dirt or not, but of course feels hopeful. His ground has never been prospected, and from the fact that it lies in a mineral belt and no great distance from paying mines it is reasonable to conclude that his claim will pay out well. The same may be said of all the claims located below Johnnie's till Pat Flynn's is reached, some distance below. This claim is not open, but sufficient work has been done to demonstrate the fact that it will pay well. Mr. Flynn is recognized as one of the best miners in the camp, and is going about his work in a systematic manner. Between the first and fifteenth of March he will have 40 men at work sluicing off the snow and surface ground. Later he proposes to increase his force to about double the number.

The "Widow's Claim,"

Owned by Keeler & Co., comprising ten men, joins Mr. Flynn's below. This is the best developed mine on the creek; in fact, it is the only one that bears evidence of work. That it is rich, we presume there is no doubt. Mr. Keeler says they took out \$18,000 during their short run last fall, and operated it with a small force. He expects to work 75 or 100 men the coming season.

Mr. Murray's claim joins the "Widow's." His ground is not open, but we understand prospects well. Upon his claim is located the famous town of Murrayville, the rival of Eagle City. Below him comes the Ives' claim and several others, all unopened, when Bill Osborn's is reached. A town has also been laid out on this claim, and as the Evolution pack trail taps the creek at this point, it is thought the town, which is called Osborn, will loom up to huge proportions before the season is far advanced. Mr. Osborn already has a store and saloon, and quite a number of houses have been built. It is the prettiest site on the creek, and is rightly dubbed "Osborn Park." The claim upon which this town is situated shows up in good shape so far as prospected. A drain is being cut and other preparations are being made for vigorous operations as soon as the weather will permit. Bill Osborn is the prince of good fellows, and

your correspondent is not alone in wishing him the best of success.

From this claim down to Eagle City, and a distance of three and one-half miles below,

No Sign of Work

is visible. It is doubtful whether the owners of the ground know whether there is color in it or not. The Campbell claim, owned by Dr. Campbell, Frank Point and others, located at the point mentioned, three and one-half miles below Eagle City, has been worked to a considerable extent. This claim was bonded some time ago for \$3,000, but the parties failing to come to time the money put up was forfeited. Dr. Campbell has several ounces of dust taken out of the claim and says it pays handsomely—about \$30 a day to the man. Below him no claims are being worked. This exhausts Pritchard creek, the distance gone over being 17 miles. You can now judge of the prospects and what is being done in the main stream of the camp. It will be seen that aside from a few claims it is difficult to tell whether the ground will yield bountifully of the precious metal or not. There are quite a number of side gulches making into Pritchard creek that have been taken up, but their wealth is equally uncertain.

Beaver Creek,

A small stream running parallel with Pritchard, and which empties into the north fork of the Cœur d'Alene river a few miles below Pritchard, has been taken up by gold hunters, but it is not known that there is pay on the bedrock, so to speak. People in that country are wild, and lay claim to everything in sight. I have now gone all over the mining ground, and your readers can judge for themselves as to what it contains. One thing sure, I feel fully convinced after a careful survey of the field and the many conversations had with the best miners of the camp, that there is not sufficient in sight to warrant one-fourth the excitement there about the Cœur d'Alene mines. What the quartz will develop remains to be seen. I am rather inclined to believe that the quartz ledges are rich, and will prove the main stay of the camp.

It is Nonsense

To talk of 50,000 people going into the Cœur d'Alenes with the hope of doing business. Ten thousand men, including merchants, miners, teamsters and all other kinds of laborers, are sufficient to work all claims thus far taken up, within two years. And this estimate is based on the hypothesis that the ground claimed is all rich. It is reasonable to conclude, however, that 40,000 or 50,000 people will visit the Cœur d'Alenes between now and next summer. The gold taken out is of a coarse quality, and worth \$15 to the ounce. It is certainly beautiful, the mere sight of which being enough to cause the average old miner's eyes to dance with delight, and lure him on with a stout heart in search of new fields to conquer.

While I consider there is an unwarrantable excitement concerning this camp, I am impressed with the belief that the rush of old miners into the camp will not be unattended with good results, as it will serve to give that mountainous and heretofore isolated and unexplored country a thorough prospecting. It is evidently a gold-bearing country, and the overplus of population will have a chance to tax its energies in searching out the rich spots.

The Towns.

Concerning the towns located in the camp, a passing notice was made in my last. Eagle City and Murrayville, five miles apart, are struggling for the mastery, each having a plausible argument to put forth in its behalf. Eagle City claims to be more favorably located, and being the oldest town, hoots at the idea of being outstripped by any other. Property here is very high and still rising. Lots range from \$750 to \$3,000, and on entering the camp a stranger imagines himself on California street, San Francisco. Owing to the scarcity of lumber, comparatively few buildings of a substantial nature are going up. People seem willing to occupy tents or rudely constructed log houses for the present, hoping soon to be able to procure lumber with which to improve their lots. Two or three sawmills are now on the line of the railroad awaiting the completion of the road into the mines. They will be located a short distance above Murrayville, in the midst of as fine a belt of pine and cedar as one would wish to see in any country. Whip-sawed lumber is worth fifteen cents a foot, and scarce at that. Little can be done in the mines until the sawmills get in.

ORGANIZATION OF MINERS AND MINE OWNERS.—An organization, to be known as the "Glencoe Miner's Protective Association," having for its object the prosecution of the unlawful acquirement of valuable mineral lands under agricultural patents, has been formed at Glencoe, in this county. Sixteen names were enrolled at the first meeting. Mr. Walter C. Childs was elected President and Treasurer, and Mr. F. Cummings Secretary of the association. An ample fund has been provided, and every lawful means that money and labor can procure will be employed to protect the interests of mining at Glencoe.—*Calaveras Chronicle*.

CONCENTRATION.—A Wood River exchange, in speaking of the discontinuation of the \$20 freight rates on low-grade ores, speaks of the concentration of such ores as the next best means of making them profitable. The ores of Wood River will in a few instances admit of

profitable concentration, but the lowest-grade ores are often chiefly carbonates that cannot be concentrated to an advantage. Such ores carry a high per cent of lead, and will generally find sale at the smelters where such admixtures are required. It is not probable, however, that the U. P. Ry. will persist in discontinuing such rates as will induce large shipments so long as there is any profit to them in the transportation.

The Origin of Ore.

The following extracts are from a lecture by Prof. John A. Church, delivered to the pupils of the public schools in Tombstone, Arizona:

No one has ever seen ore in process of formation, but something has been learned of its formation and I will try and tell you how it is deposited in Tombstone. In the human frame there is a circulation of blood passing from the heart through the system and back to the heart. In plants there is a circulation of the sap; the earth has its circulation—water comes to it, passes through it and rises again to its surface in the form of springs. The first thing to be observed is the rainfall passing into the rocks. Rain penetrates more than twenty miles into the crust of the earth; it dissolves substances—ore as well as sugar. When we wish to extract the silver we add salt and blue-stone; every substance can be dissolved in the water, even the quartz; limestone is readily dissolved. Rain water in passing through the earth takes up minerals—lime, iron, potash, etc., which are deposited in the interior of the earth, and then return again in the form of springs. The rainfall is pure, but the springs are not pure, for they have taken up these mineral substances. Air also circulates in the earth; it takes up oxygen and nitrogen. When these combine with a solid rock the rock is said to be hydrated. This air is passed upward through the rocks as the water passes downward. These form springs.

In addition to water and gas, the earth has a circulation of solids; sea waves beat on the rocks and wear them away—where those particles are coarse we have pebbles; where smaller, we have coarse sand; smaller yet, mud, portions of limestone. Sea beaches are found in the mines of Tombstone.

When these particles are first worn off they are borne away—the finest particles borne far away and called shale. In the mines of Tombstone are found limestone, quartz and shale; which proves that where we now stand, on the hills of Tombstone, it was once deep water.

This history of a rocky sea cliff is the history of a whole world. The world was originally composed of gas, much heated and then cooled—like the volcanoes of the present day, where the top goes to the bottom and the bottom comes to the top.

No one has ever seen the original earth. It cooled gradually from a gas to a solid. In this way the chemist tries to obtain pure water: He takes water as pure as he can find it; heats it; then cools the steam and repeats the process until he gets a pure water. In this way quicksilver is purified, and camphor gum. So, a gas will condense into a solid, and a solid may be heated until it becomes a gas.

This earth was once a gas, heated and then cooled, until it became a solid. It is by these circulations of water and air that the ores are collected together and found in one place. If we were to see the original earth, unacted upon by the circulations which I have attempted to explain to you, we should find the quantity of metals in rock very, very small. At Comstock lode, Nevada, are found volcanic rocks which contain 55 per cent silver, and gold 45 per cent. So in the eruptive rocks of Leadville, Colorado, the proportions of gold and silver have been found to be similar. The geologists have been able to show how many tons of rock must have been dissolved to give this per cent of precious metal. The waters found holes, or crevices, where they could deposit the metals they had taken up, all of which are not deposited 3,300 feet or one mile below the surface of the earth, so that mining for these metals will not be carried any farther than one mile below the earth's surface, though the water penetrates 20 miles into the earth; the deeper the water goes the more the pressure, and when you increase the pressure you must increase the power of solution; releasing the pressure also releases the metals; the waters passing through the rock are forced now slowly, now more rapidly, and when such waters reach the crevices there is much less speed of the waters, and the metals are deposited there. In regard to the deposition of ores, scientists show us that the rocks have been acted upon again and again by water, and in this way the ore is collected. It is difficult to distinguish the age of the rocks, but they have shown where the first concentration of the metals in the oldest rocks known gave a yield of only one-half cent to the ton. The part of the circulation which collects metals is called the function of the circulation.

No one knows why the precious metals are deposited in veins, or in beds; but one thing can be shown—that where these ores are found there are eruptive rocks. In the western part of our country this is especially true.

Where not only shales but dykes are found—where melted rock has been forced to the surface, but by the action of water has been carried beneath the surface, which shows eruptive forces at work, so it is in the hills of Tombstone—forces as simple as the ordinary forces that work in every housekeeper's kitchen or chemist's laboratory.—*Republican*.

MECHANICAL PROGRESS.

The Art of Fusion.

If a detailed history of the art of melting could be written it would be found to be as full of interest as that of any other of the arts practiced in the manipulation or the manufacture of metals. It has been well known from the earliest time, and it is certain that it was the first to be largely used, as distinguished from the art of forging or of welding, and of brazing or riveting.

The effect of heat in producing fusion or a softened and melted state is at the present day one of the first points to be noted with accuracy in any examination or testing of a new combination of metals. It is also an important guide to those who are aiming to improve the quality of the metals long known and used in the arts.

There are many reasons for believing that the earliest development in the use of metals was the result of accidental application of fire to them, as they existed in their ores, but it is also certain that these chance indications were followed by the most painstaking study of the possibilities of each case, and that the remarkable example of ancient metal-work were in no sense due to any lucky accident, but rather to the skill developed by watchfulness and careful trial of the same methods day after day.

If the ironworkers of the present day have more resources at their command, in the finer qualities of the iron and steel which they employ, than the smiths of ancient time, it cannot be said in strict truthfulness that the result of their handiwork have always been proportionate to the abundance of these resources, or such as to fulfill completely the demands which have been made upon them. It is rare that all lines or departments of an art advance with equal steps, and so it is sometimes found to be true that one will be supplanted by another for a time, and that some incidental or collateral advantage will afterwards lead to a return to the use of the first. The process of welding, for some purposes, has at times seemed to take the place of riveting, but an immense increase in the sizes of plates and bars which it became practicable to roll has turned the scale again in favor of the methods of riveting and pinning for the joining of parts to each other.

So also just now the attention of builders of heavy machinery, and even of large sizes of guns, is turned with deepest interest, and even with great anxiety, to the advance in the art of fusing or melting the high-grade metals, the various qualities or grades of steel of which these heavy pieces are to be made. The progress actually made in this art in this respect is quite sufficient to warrant the fullest expectation that has thus far been entertained of it. The prospect is very clear that with the daily experience of many foundries in the study and practice in the art of fusing that stubborn but valuable metal, steel, the day is close at hand when the more compact and massive pieces or parts of all kinds of machinery will be made of it, to the great advantage of all concerned.

This very important result is due solely to the study and constantly advancing practice of this oldest of all arts in metals, and to the improvements made in the apparatus employed. In this respect the advance from the time of the medieval workers is simply incredible, and indeed the short space of thirty years covers nearly the whole span from the day of a trifling capacity of furnace for melting, to the present time, when the limit is rather the power of existing apparatus to move the finished casting.—*Industrial World*.

COMPRESSING CAST STEEL.—Great advantage is claimed for pressure in the casting of cast steel—the greater the pressure the more satisfactory the result. Mr. E. B. Meatyard, of Lake Geneva, Wis., says: "I make plans on pressing Bessemer steel in the molds, while in a semi-fluid state, to a specific gravity of nearly eight. I have obtained 7.93 in 30-pound masses with 2,500 pounds per square inch pressure. I am going to get 5,000 pounds per square inch on large weights, which will hold heat longer. Ten tons at one time, to a density of eight degrees, with less than five cubic feet of water to actuate three sets of toggles, compounded into each other. Elastic limit, 45 tons; estimated strength was 70 tons, and the ductility was equal to Norway steel, or any first-class mild steel, and all this with a high degree of carbon. Hard and tough is my aim."

STRAIGHTENING HARDENED STEEL.—It is well known that files are not usually drawn after being hardened, and that the hardening frequently springs them out of line. But, notwithstanding that the files are made as hard as they can be by heat and cold water, they are readily straightened after being hardened. This operation is performed at once, as soon as the files have been dipped. The files are taken from a bath of melted lead and chilled while red hot in a tank of running water. This immersion for the instant hardens only the surfaces, while the interior is soft and pliant with heat. At this time the file may be straightened by bending over and under bars. By similar means crooks in steel arbors, reamers and other long tools may be removed, even after they have been hardened and tempered. A cast steel saw arbor had received an offset or crook in the journal at one end just inside the shoul-

der. The crook was at the worse end, that next the saw, and, although scarcely perceptible to the eye when the arbor was turned on its centers, it was sufficient, when the arbor was in the boxes, to throw the periphery of a two-foot saw considerably out. The arbor at the bearing part was very gradually heated, not enough to change color, but to a "black heat." A V-shaped block was placed in a vise bearing against the offset side of the journal, and the vise screwed up. At the third trial the arbor came out perfectly true. A tempered reamer was straightened in the same way, the point at which it was crooked being heated by an alcohol lamp. The heat was sufficient to allow the steel to give, but not enough to start the temper. Steel that has a blue temper only may be straightened by blows with a pony hammer on a smooth, clean anvil, the face of which should be warmed enough to remove the chill.—*Scientific American*.

BRASS CASTINGS.—If what was put in a crucible came out of it, there would be less diversity in results. What with the volatility of some metals and the varied melting points of others, in the same mix, it is wonderful that anything like uniformity can be obtained in ordinary work. Zinc sublimes (burns away) at 773 to 800 degrees, while the heat of the metal with which it should be intimately mixed in making yellow brass—copper—is nearly 2,000 degrees. Zinc, tin and lead enter into compositions of copper, to form alloys in varying proportions (always in definite quantities for a given alloy). It will be seen, therefore, from the ease with which the lesser metals are burned away, at comparatively low temperatures, that it is a very easy matter to make several kinds of metal with the same mix.—*Age of Steel*.

A NEW TOOL FOR MINING USE has just been patented, which combines a candle-holder, fuse cutter and suspending hook, is composed of a bar pointed at one end, to be stuck into a wall, and having a finger ring on the opposite end. Upon the bar is fastened the candle socket. A suspending hook is likewise pivoted to the bar, which is to be used in case the device is to be suspended from a projection. The hook has a small cutting edge which works against a similar cutting edge of the bar. When the fuse is to be cut it is placed on the bar, and the hook swings down.

BLOW-CKOCKS.—Every boiler should have two blow-valves, one placed near the surface of the water, called the "surface-blow," and one placed near the bottom, called the "bottom-blow." The surface-blow is the smaller of the two, and is generally used for blowing out when freshening the water; the bottom-blow is mostly used when blowing out entirely for repairs, or cleaning out. Plug cocks are sometimes used, but they are very inferior to globe-valves for that purpose, or indeed for any other.

SHARP CORNERED DRAWING TOOLS.—A sensible correspondent of the *American Machinist* very justly complains that "manufacturers of drawing instruments make them so full of little sharp corners and interior angles," and suggests that they be made "of round or oval cross sections, with no places where dirt can collect." The trouble is, that makers of drawing tools very seldom, if ever, have any practical experience in the use of such instruments, and are unknown to those who have.

The effect of a safety valve in the lower part of the boiler has been tested in England. A boiler was prepared with the ordinary safety valve and an additional one attached to the lower part, both equally secured. Heated to redness, the boiler had cold water pumped into it, and in a minute a pressure of between 50 and 60 pounds was produced. The lower safety valve was the first to act, giving entire satisfaction to the experimenters.

PROGRESS IN MECHANICAL ART.—In the history of mechanical art two modes of progress may be distinguished—the empirical and the scientific. Not the practical and the theoretic, for that distinction is fallacious. All real progress in mechanical art, whether theoretical or not, must be practical. The true distinction is this: That the empirical mode of progress is purely and simply practical; the scientific mode of progress is at once practical and theoretic.—*Rankine*.

SODA ASH IN BOILERS.—An English boiler inspection company recommends that soda ash be used to prevent scale, instead of soda crystals, and that it be pumped in regularly and continuously in solution, with the feed, instead of spasmodically dumped in solid through the manhole. By many, tungstate of soda, instead of either soda ash or soda crystals is preferred.

HOT JOURNALS AND BROKEN SPRINGS.—In the *Scientific American*, dated March 12th, 1881, there appeared a resume of a series of very interesting experiments, tending to prove that heat is a great factor in making steel brittle. These experiments naturally suggest one probable serious cause of broken journal springs.

Two American locomotives have arrived in Chili, South America, for the Southern railroad. The engines are the first installment of an order for 10 locomotives, 300 cars and 5 restaurant cars. The latter cars are intended for use on the express train.

SCIENTIFIC PROGRESS.

Symbiosis.

Professor Hertwig, according to *Nature*, at the last meeting of German naturalists, read a paper on this subject. This term, symbiosis, first suggested by De Bary in connection with certain phenomena of the vegetable world, is here extended to the whole organic system. As distinguished from ordinary parasitism, it is explained to mean the normal fellowship or association of dissimilar organisms which dwell together in a common abode for their mutual welfare. In the case of parasites the connection is altogether one sided; one of the two organisms attaching itself to the other and flourishing at its expense, as, for instance, the mistletoe on the apple tree.

But in this newly revealed phenomenon of symbiosis, which appears to pervade the whole biological world, both associates are mutually beneficial, and in some instances even indispensable to each other. They act, so to say, like two partners in a well regulated business concern, co-operating in the work of life, taking part in all its toils and troubles, and honorably sharing the common profits. An illustration is drawn from the familiar hermit crab, one species of which, after taking possession of the first available empty shell, goes into partnership with a sea anemone (*Adamsia palliata*). This lonely creature, bright orange spotted with red, attaches itself to the roof of the common abode in such a position that its mouth and prehensile apparatus are always turned toward the head of its associate. It is thus enabled to join in all the expeditions of the restless hermit crab and conveniently share in the common plunder. In return for this service, the anemone protects his companion from his many enemies by means of the numerous long threads which it shoots out at the least alarm, and which are provided with millions of capsules charged with a stinging acid like that of the common nettle. So close is the compact entered into by the two partners, that both have become indispensable to each other, as appears from a series of experiments made at the Neapolitan Aquarium. If the crab be removed from his house, and this be stopped up so as to prevent his re-entering it, he will cast about for another shell, and never stop until his old associate is also transferred to their new abode.

A still more remarkable illustration is drawn from the *imbanba*, or candle nut tree of South America, which strikes up an alliance with a species of small black ant to their mutual benefit. The whole subject of symbiosis, which naturalists are only beginning to study, is calculated to throw great light on the Darwinian theory of biological evolution. The various cases of fellowship between animals and plants of different orders, and even between members of the animal and vegetable kingdoms, show how, in the perpetual struggle for existence, the individual organism avails itself of the smallest advantage to secure a place in the household of nature. It often thus acquires marvelous habits of life, which it is afterward unable to lay aside, and in consequence of which it becomes gradually modified in its bodily form and organization. Thus *abyssus abyssum invoca*, one charge superinduces another, altered conditions require fresh combinations, and the organic world resolves itself into an everlasting ebb and flow of life, in which the individual counts for nothing, the species—itsself transitory—for but little, and the sum of existence alone is considered in the self-adjusting scheme of the universe. Symbiosis thus leads at once to a broader and more searching study of various branches of human knowledge.

To prosecute the subject successfully, vegetable and animal organisms must be examined, normal and morbid conditions attended to, anatomical and physiological questions investigated. For this boundless theme belongs to a border land in which zoology, botany, anatomy, physiology, and pathology meet as on common ground.

THE ARTIFICIAL FORMATION OF MINERALS AND ROCKS.—Nearly all the interesting researches that have been made in forming minerals by artificial means are due to the chemists and mineralogists of France. Among these, none are of more importance than those performed by Messrs. Fouquet and Michel-Levy in the formation of various volcanic rocks and minerals through fusion. Recently they have collected their researches, heretofore scattered in several periodicals, in the form of an important volume entitled "*Synthese des mineraux et des roches*." They employed platinum crucibles incased in fire-clay and kept at a high heat for several days, by means of a gas blast. By making use of the principle that minerals crystallize from the fluid magma in the inverse order of their fusibility, and by keeping the melted minerals at different temperatures, carefully chosen, a number of artificial products closely resembling natural minerals and rocks were produced. Thus from a fused mixture of anorthite and augite, plagioclase crystals were obtained by a white heat, kept up for forty-eight hours, and on a second heating at a lower temperature, augite crystals were formed, and the characteristic structure of an ophitic diabase was obtained. Most of the basic basaltic rocks were thus artificially formed by one or more fusions of a mixture of minerals. The acidic rocks, or those

containing quartz, orthoclase, muscovite, hornblende, etc., could not thus be produced. An amorphous or glassy mass was obtained, and the latter minerals would not crystallize out of a fused mass. The interesting conclusion is therefore reached that granite, gneiss, and other acidic rocks, with their inclosed minerals, are not the result of igneous fusion. This is in accord with the generally accepted belief of geologists, derived from many considerations.—*American Naturalist*.

A NEW MOTOR.—Announcement is made of a new and remarkable motor known as "The Triple Thermic" motor. The motive power is the vapor of carbon. It has been in practical use in driving a sixty-horse power engine for six months past, on West Forty-sixth street, New York. The discoverer of the means of applying the new power and inventor of the machinery adapted to its use is W. S. Colwell, formerly of Pittsburg. It is claimed he has been at work many years on the application of the same. The material from which the vapor is generated, bisulphide of carbon, was discovered in the last century. The force and power of the vapor surpasses that of steam, and its application and regulation are already under more perfect control than steam. The invention or discovery consists in evolving bisulphide of carbon into a vapor for operating machinery by generating heat in a generator and transferring it into a vessel containing bisulphide of carbon. The latent heat of the steam is utilized to convert the bisulphide of carbon into vapor, only 118 degrees being necessary to produce this vapor. A prominent engineer of Chicago, giving the result of his examination of the new motor, says: "I saw a fifteen-horse power boiler with very little fire under it generating steam which operated the new motor, which in turn ran an engine of sixty-horse power." A syndicate has been formed which controls the invention and its patents. The capital stock is \$25,000,000, of which \$8,000,000 has already been realized on sales of stock. Ex-Governor Hubbard, of Texas, and ex-Collector Baird, at Boston, are mentioned as being largely interested in the new motor syndicate.

THE DEAD SEA.—A writer in a German magazine gives a sketch of the famous Dead Sea. He substantially confirms all the traditional characteristics, except as to the appearance of the landscape and some other minor particulars. He declares that no Sicilian bay nor the Gulf of Corinth presents more varied or beautiful coloring, only the water seems darker, as of a molten metal. He denies the general statement that no bird flies over the waters, and that its shores are without vegetation. But he confirms the tradition that no living thing is found in it; fish coming down by the Jordan die at once on coming within its bounds. The water is so "thick" that he moved it with difficulty; its bitterness was terrible; the bottom was slippery, like soap, and one can scoop up with the hand a slime like mortar. The touch of it causes great smart to the eyes. While the temperature of the atmosphere was sixty degrees Fahrenheit, that of the water of the Dead Sea was sixty-four degrees. On coming out of it the body was thickly incrimed with crystals of salt of magnesia and soda.

BOILING OXYGEN.—In a paper presented to the French Academy, M. S. Wroblewski refers to his experiments in the liquefaction of oxygen, and attempts to make use thereof as a refrigerating agent. This he found to be exceedingly difficult, owing to the necessity of using tholiquefied oxygen in closed vessels of great strength, and the very short duration of the ebullition. By means of a thermo-electric method the author was able to get an approximate measurement of the temperature at which liquefied oxygen boils when the pressure is suddenly released, which is stated to be 186° C., or 302.8° F. below zero. This is probably the lowest temperature ever recorded. The author suggested nitrogen, after being compressed, to the action of this extraordinary cold. When the nitrogen was then allowed to expand a little, it solidified, and fell like snow in large crystals.

NOVEL THERMOMETER.—The ordinary mercurial thermometer is, as is well known, based on the dilatation of bodies by the action of heat, and on the difference of dilatation between mercury and glass. A new thermometer, in which the mercury column sinks with a rise of temperature, has, moreover, been introduced by M. D. Latschinnoff, who has based his instrument on the discovery of Kohlrausch, that the coefficient of dilatation of ebonite is greater than that of mercury. Latschinnoff has made the reservoir of his thermometer of ebonite, and the result is that the level of the mercury falls in it when the temperature rises, and, on the contrary, rises when the temperature falls. A rise of 20 degrees Cent. lowers the mercury 25 millimeters.

THE VOLCANIC ASHES FROM JAVA.—It is estimated that the ashes which caused the recent red skies must have reached an elevation of fully sixty miles. On an estimate that a solid mass of one cubic inch of ashes was diffused through 135,000 inches of atmosphere, the entire quality of ashes which floated off in the atmosphere must have been sufficient to form a solid mass one mile high, forty-two miles wide and seven-hundred miles long. This is exclusive of the immense mass which fell upon the sea and land within a circuit of some one hundred miles in diameter.

SAN FRANCISCO:

Saturday Morning, March 15, 1884.

TABLE OF CONTENTS.

EDITORIALS.—Snow Slides; Retorting Gold and Sil-
ver Amalgam; A Drill Hole Cleaner; Blasting in Coal.
189. Passing Events; Iron in California, 192. Gold
in the Potsdam Formation; Dark Transits of Jupiter's
Satellites, 193.
ILLUSTRATIONS.—Improved Retort and Condenser
for Silver Amalgamation, 189. Sketches of Jupiter;
Approximate Geological Sketch from Homestake Vein
Westward, 193.
CORRESPONDENCE.—The Harris Mines, Washoe,
190.
MECHANICAL PROGRESS.—The Art of Fusion,
Compressing Cast Steel; Straightening Hardened Steel;
Brass Castings; Blow-cocker; Sharp Cornered Drawing
Tools; Progress in Mechanical Art; Soda Ash in Boilers;
Hot Journals and Broken Springs, 191.
SCIENTIFIC PROGRESS.—Symbiosis; The Arti-
ficial Formation of Minerals and Rocks; A New Motor;
The Dead Sea; Boiling Oxygen; Neum Thermometer;
The Volcanic Ashes from Java, 191.
USEFUL INFORMATION.—Pearl Flour; Bon-
nay More Crowded than London; Look on the Bright
Side; Pressure of the Sea; Rough on English Cars;
Removing Stains from Cotton or Linen Goods, Curtains,
etc.; New Grain Tester; No More Bell-Cords; To Dis-
solve Amber for Varnish; To Remove India Ink;
Weight of a Crowd, 195.
GOOD HEALTH.—Health of Cities; Sugar as a
Dressing for Wounds; Beef Juice vs. Inf Tea; Snake
Bites and Hydrophobia; The Use of Milk; Length of
Life Increasing; Prompt Cure for Ringworm; To Pre-
vent Lead Poisoning, 195.
MINING SUMMARY.—From the various counties
of California, Nevada, Arizona, Idaho, Montana, New
Mexico, Oregon and Utah, 193-97.
MISCELLANEOUS.—The Cœur d'Alene Mines;
The Origin of Ore, 190. Industrial Education; Smelt-
ing Notes from Chihuahua, Mexico, 194.
MINING STOCK MARKET.—Sales at the San
Francisco Stock Board, Notices of Meetings, Assess-
ments, Dividends and Bullion Shipments, 200.

Business Announcements.

Passing Events.

The establishment in our midst of a technical
school in which the trade of cigar making is to
be taught, in order that the boys and girls may
take the place of Chinese, is an important in-
dustrial move. It is to be hoped that the ex-
periment will be successful. In this city the
manufacture of cigars is an important industry,
and will give employment to several thousand
white persons, between 3,000 and 4,000 Chinese
being displaced.

A great number of miners are leaving for the
Cœur d'Alene mines. Travel in that direction
by way of the U. P. R. R. is enormous. About
150 people a day, on an average, go through in
the trains via Granger.

The recent storm has been widespread, and
though doing some local damage in different
places, has been generally beneficial. The
farmers look for heavy crops this season all over
the State, Southern California having been ex-
ceptionally visited by copious rains.

Mining news just now is somewhat scarce,
owing to the fact that the weather has been so
bad it has been difficult for men to get about in
the mountain regions where most of the mines
are situated.

The wages of the men employed by the Star-
mont Company of Silver Reef, Utah, have lately
been reduced. Now the engineers and black-
smiths receive \$4 per day; miners, \$3; top
hands, \$2.50; amalgamators at the mill, \$3.75,
and wages of all other employees have been re-
duced accordingly.

Iron in California.

California does not cut much of a figure in
the production of iron ore. Among the Pacific
coast States and Territories, however, she is
second in production of pig iron, and first in the
manufacture of rolled iron, rails, etc. The
latest full statistics we have are those of 1882.
Then Oregon produced 6,750 tons of pig iron,
and California 987 tons. But Oregon made no
rolled iron, rails or anything of the kind. Cal-
ifornia, however, produced 25,843 tons of rolled
iron, including iron rails and nail plates. She
made 3,036 tons of iron rails and 5,164 tons of
steel rails in that year. In 1881 California
produced 4,414 tons of pig iron, Washington
Territory 1,200 tons, and Oregon 6,100 tons.
This was all charcoal pig.

California's production of all kinds of rolled
iron (including iron rails and nail plate) from
1873 to 1882 was as follows:

Year.	Tons.	Year.	Tons.
1873.....	7,420	1879.....	15,952
1874.....	16,221	1880.....	15,277
1875.....	14,194	1881.....	19,839
1876.....	15,465	1882.....	25,843
1877.....	11,542		
1878.....	13,251	Total.....	115,094

California's production of rolled iron (exclud-
ing rails and plate and sheet iron) for 1873 to
1882 is shown in the following table. This in-
cludes bar, bolt, skelp, hoop and shaped iron
and railroad axles:

Year.	Tons.	Year.	Tons.
1873.....	6,945	1878.....	6,472
1874.....	9,205	1879.....	9,016
1875.....	6,121	1880.....	10,555
1876.....	6,836	1881.....	14,204
1877.....	5,792	1882.....	22,507

The production of all sizes of iron rails in Cal-
ifornia has been as follows:

Year.	Tons.	Year.	Tons.
1873.....	475	1878.....	6,790
1874.....	7,016	1879.....	6,936
1875.....	8,073	1880.....	4,722

In 1881 and 1882 we made steel rails. The
product of both iron and steel rails in this
State in 1881 was 6,035 tons, and in 1882, 8,200
tons. The Pacific Rolling Mills, in this city, do
the work on rails and other rolled iron. Our
foundries use large quantities of wrought and
cast iron, so that a great deal has to be brought
to this coast.

Iron ore is now mined in 25 States and two
Territories as follows: Maine, Vermont, Massa-
chusetts, Connecticut, New York, New Jersey,
Pennsylvania, Delaware, Maryland, Virginia,
North Carolina, Georgia, Alabama, West Vir-
ginia, Kentucky, Tennessee, Ohio, Michigan,
Wisconsin, Minnesota, Missouri, Texas, Colo-
rado, California, Oregon, Utah and Washington
Territories. Very large deposits are found near
Lake Superior, in Michigan and Wisconsin;
near Lake Champlain, in New York; in south-
eastern Missouri; in northern New Jersey, and
at Cornwall, Lebanon county, Penn. Smaller
deposits are innumerable.

There are several interesting facts relating to
the distribution and development of our iron
and steel industries. Massachusetts is a large
producer of rolled iron, but the raw materials
for its manufacture are almost wholly procured
from foreign countries. Michigan is a large
producer of pig iron, every ton of which is made
with charcoal, although five-sixths of all the
pig iron in the country is made from coal.

Delaware makes nothing but rolled iron,
and Georgia makes nothing but pig iron. Tennes-
see is the most progressive of all the Southern
States in the manufacture of iron and steel.
After Pennsylvania the largest producer of
iron rails is Indiana. The United States Gov-
ernment is a manufacturer of rolled iron at the
Washington navy-yard. California rolls more
iron than Connecticut, and Wyoming Territory
more than Maine and New Hampshire united.
Wheeling makes more nails than Pittsburgh,
but Pittsburgh makes nearly three-fourths of
all the crucible steel made in the United States.
Blossoms and billets made directly from iron ore
in forges, which is the most primitive of all
methods for the manufacture of iron, are pro-
duced chiefly in the Champlain district of New
York, and blossoms made from pig and scrap
iron in bloomeries, according to the old Wal-
loon method, are made chiefly in Pennsylvania.
Down to 1855 charcoal was the principle fuel
used in the production of pig iron in this coun-
try, but in that year we made more pig iron
with anthracite coal than with charcoal. Anthra-
cite remained the leading fuel for use in blast
furnaces down to 1875, in which year bitum-
inous coal and coke became the principle fuel
for this purpose, and this position they have
since maintained. Bessemer-steel rails were
first manufactured in this country as a com-
mercial product in 1867, but ten years elapsed
before their production equaled that of iron
rails. This occurred in 1877. In 1882 the
production of steel rails was more than six times
as large as that of iron rails.

A New Industrial Movement.

Within a few weeks the cigar manufacturers
in this city resolved to get rid of the 3,000 or
4,000 Chinese employed by them, so they
banded together and "locked out" their Mon-
golian employees. These men are still out.
The manufacturers have formed an organiza-
tion called the Cigar Manufacturers' Associa-
tion of the Pacific Coast. Then, knowing that
on this coast there are few whites able to make
cigars, they decided to incorporate, with a
capital stock of 100,000, divided into 5,000
shares of \$20 each, to found a technical school
for the education of our white youth in the
mysteries of cigar making. The school is to be
fitted up with all necessary tools, machinery
and appliances, with proper instructors and a
superintendent. The scholars are to be trained
both practically and theoretically. The gradu-
ates are to be allotted to the several manufac-
tories for employment in proportion to the
amount of stock each manufactory may have in
the corporation. Shares to the value of \$70,000
were subscribed for, and \$2,600 contributed
towards the project.

The following Directors were unanimously
elected to incorporate the association, to com-
mence operations at once: J. W. Shaeffer, H.
Engelbrech, E. Goslinsky, Rudolph Mayrisch,
Sol. Falk, I. S. Rosenbaum, Sam Lewis,
M. Kaufman and J. S. Bowman.

Suitable rooms are to be secured and fitted
up with necessary appliances and machinery,
and superintendents and instructors are to be
employed, a supply of leaf tobacco being laid in.
The product of the pupils' labor is to go to de-
fray the expense of the institution, which con-
templates a superior technical training in the
manipulation, selection and grading of tobacco.
Rooms have been received for the "school," and
already applications have been made from 152
girls and 315 boys. This shows that the in-
dustrial school is going to do some good and
was needed. Anything that will give steady
employment to the boys and girls of the city is
of great benefit to the community, for it is a
fact that there are too few occupations open to
our youth. Parents and guardians should avail
themselves of this chance for securing for those
dependent upon them the knowledge of a trade
which will enable them to earn a decent liveli-
hood. The technical school should always be
filled to its utmost capacity, those who have
become proficient making way for beginners.
By this means a steady supply of skilled labor
would be kept up.

Industrial Notes.

There are 550 hands at work in the Oakland
jute mills.

The boiler works of Miller, Fisher & Ketscher,
in Oakland, employ 21 men.

The stormy weather has kept back work on
the proposed new glass factory at Oakland.

The sweeping by machines of 197 miles of
streets in this city in February cost \$6,731.

The tack factory, at the Judson Iron Works,
across the bay, is nearly completed, and will
soon be in operation.

M. Pardini & Co. have been given permission
by the Supervisors to maintain a steam boiler
at 912 and 914 Battery street.

The telegraph line franchise to Point Lobos,
petitioned for by Robert Day and others, has
been finally granted by the Supervisors.

H. Huddleston & Co. have applied to the
Supervisors for permission to maintain a steam
engine and boiler at Nos 322 and 324 Fremont
street.

At Turner's yard, Benicia, the yacht *Nellie*
is being strengthened and overhauled. The
small schooner for Point Reyes trade will be
launched shortly.

In January and February 59 buildings were
put up in Oakland, at an aggregate cost of
\$121,450. Most of them were small dwellings,
costing about \$2,000 on the average.

White, the North Beach ship builder,
launched a new schooner this week, called the
Ountmak. She is to run to the Choumagin
islands, up north, in the fishing trade.

At the last meeting of the Board of Super-
visors a resolution was adopted directing the
City Engineer to revise the plans and specifica-
tions for the construction of brick sewers, etc.,
in Eighteenth street, from Guerrero to Dolores
street, and in the crossings of Eighteenth and
Dolores, and Eighteenth and Church streets, so
that the brick-work shall be twelve inches
thick instead of eight inches, as at present
provided; also to furnish carefully prepared
estimates of the cost and expenses, etc.

Ship spars from this coast have a world-wide
reputation. An Oregon spar is the toughest
piece of wood known, when size and lightness
are considered. Oregon pine will bend and
twist without breaking to a surprising extent.
Ship loads of these spars are occasionally sent to
Europe and elsewhere. The ship *Snow* and
Burgess, now here, will take a load of spars
from Port Blakely to New York. The Eastern
ship-wrights need the wood badly.

Gold in the Black Sands.

[Written for the Press.]

I have written much on the loss of gold as
connected with quartz mines, but it is not on
this department of industry wherein all the
gold is lost. Our hydraulic drift and river oper-
ations may be charged with having even a
higher percentage of wastage.

Within the past year I have given consid-
erable attention to these departments of mining,
and regarding my results as of general interest
here give them in part. The great loss of gold
in our hydraulic drift river workings is in that
associated with the black sands. From the
earliest days of California every prospector for
Placer or river "diggings," regarded the "black
sand" prospect as of especial value for good
diggings. Every '49er knows how gold in black
sand was used in those good old days of '49
and '50 for sanding letters, and how many
referred with pleasure to the fact that he
sanded his freshly written letter with the
golden sands.

As to the value of these sands, I know now
large quantities could have been had then,
worth all of \$10,000 per ton, as even within
the past year I have made tests almost as high.
Every hydraulic drift and river claim has
these sands in larger or smaller quantities,
and yet there is no effort to save them.
But says one, "How are you going to save
them?" I can answer this by saying,
"Where there's a will there's a way."
Another says, "Oh, we don't loose much;" and
here "ignorance is bliss." Another says, "Sup-
pose we do save them, we can't get the gold
out; they have been trying that for twenty
years, and all have been failures." To this I
will say, get the sands with the gold in, and I
will guarantee to get it out.

If every miner clearly comprehended the loss,
his mind would be disturbed, until he sought at
least to save some. It is one thing to make an
assertion, and another thing to prove it. I
make none I cannot prove, and know what I
am talking about.

To make my statements more clear, I will
now give you several of my lowest tests, and
none of the very highest, simply stating the
class of mining. These tests are made in a very
practical way, and ranging in quantities from 3
pounds to 30 each, but mainly 5 pound tests,
and one thousand tons can be worked just as
easily.

Tests from Hydraulic Mines.

No. 8, per ton.....	80
No. 9, per ton.....	4 20
No. 10, per ton.....	1 75
Average, per ton.....	\$6 82

The \$2 10, \$4 50 and \$1 35 are of the
black sands of the ocean beach below the Cliff
House. On the entire coast of California can
be found these sands in small or large quan-
tities. Thus there is more truth than poetry
in the glowing sentence, "The golden shores of
California."

It is proper to state that there was no very
close connection of these sands.

Thus I prove my assertions as to the loss. I
have the gold buttons from most of these tests,
as well as others, which those interested can see
at my office, room 20, Safe Deposit building,
San Francisco.

Now, should there not be an effort to stay
this loss, and thus have more gold to gladden
the hearts of the lovers of it and render more
comforts to mankind? It only requires an
effort, and these sands can be separated from
the debris. The extraction of the gold is the
second problem, and is easier than the first.
This saving, once inaugurated, would soon add
millions of dollars annually to our golden pro-
duct.

ALMAHIN B. PAUL.

San Francisco, March, 1884.

PRITCHARD, the discoverer of the Cœur
d'Alene mines, says that in the spring he in-
tends to astonish the natives by opening up
some new diggings that will be superior to any
on Pritchard Creek. Other old miners say
that from the indications good mines will also
be discovered on the Huron trail to the mines.

Gold in the Potsdam Formation.

At a meeting of the American Institute of Mining Engineers, Mr. Walter B. Devereux, E. M. of Globe, Arizona, read a paper on "The occurrence of gold in the Potsdam formation, Black Hills, Dakota." From this paper we make the following extracts:

The special conditions under which gold occurs in the Potsdam formation of the Black Hills present features worthy of a more systematic presentation than they have heretofore received. The notes which are comprised in this paper relate to the immediate vicinity of the Homestake vein, where are found the only deposits of the character referred to which have heretofore attained any importance as gold producers. At this point the oldest visible formation comprises the highly metamorphic paleozoic schists, which contain the gold-bearing quartz veins. Resting unconformably upon the schists is a sedimentary formation composed of debris derived from the schists, and containing the evidences of the life of the Potsdam period. The base of this formation is generally a conglomerate, which, at the Homestake vein, is very thin or absent entirely. Its section here is that of a wedge, the thin edge of which comes nearly to the Homestake vein. Early in the history of the Black Hills much excitement was caused by the discovery of gold in paying quantities in the lowest stratum of the conglomerate above referred to. The ore was readily obtained by a system of horizontal drifts, and many hundred thousand dollars were obtained in a short time. Owing to the peculiar character of the ore, the mines were known as cement mines, although the material was a true conglomerate, generally hard, and needing the stamp mill for reduction. The larger number of these deposits were found upon the eastern side of the Homestake vein, and within a perpendicular distance of about a mile. Only one paying deposit has been worked upon the western side. At present the larger number have ceased producing, and it is not probable that they will ever attain the importance that they have had, since the productive territory has been extensively prospected. The conglomerate, in places, partakes of the character of a breccia, and generally gradually merges, in the upper strata, into sandstone, or, where there has been local metamorphic action, into quartzite. The mass of the conglomerate is a mixture of quartz boulders and pebbles, and worn fragments of schists, with frequent pebbles of hematite. While there is a slight slope away from the Homestake vein, such as would be natural in a beach, the contact of sedimentary and schistose formations is essentially a plane with a slightly undulating surface, due to the unequal durability of the underlying formation. Gold occurs in these sediments in two distinct conditions, viz.: First, Gold as a mechanical constituent. Under the first head I class the principal portion of the cement gold which has been mined, while under the second head I wish to speak, in the latter part of this paper, of some gold ores of an entirely distinct character, which are found some few miles distant in the same formation. I am aware that in classing the gold of those conglomerates as a purely mechanical constituent, I am doing so in opposition to a theory, recently upheld by an elaborate argument, which endeavors to prove that placer gold is a product of local precipitation or crystallization. Careful observation in the field and a consideration of the facts, have, however, led me to reject this theory as untenable and incompetent to explain the conditions noted, and I hope in this paper to present evidence which shall justify this conclusion. The horizontal character of the sediments and the fact that their accompanying life-forms belonged to salt-water types lead us at once to the conclusion that they were ocean sediments and not river beds, and that they were formed in very shallow water, where there was strong wave action. The thinness of the deposits near the Homestake outcrop and the coarseness of the material indicate that they were beaches. The absence of gravel over the quartz outcrop shows that it was either insular, or perhaps a shallow reef.

We know that this absence of gravel is not due to more modern erosive action, because the eruptions of porphyry occurring in later geological times, and yet before the modern valleys were scoured out, have capped over the vein outcropping, and preserved it intact in many places.

This same porphyry has also overflowed the Potsdam sediments, thus giving us the proof that they were originally as shallow as they now are. In some places we have at least a hundred feet of conglomerate over the gold-bearing material, but generally much less. In order to show that the Homestake vein was large enough to have supplied gold for all these deposits, I need only mention that its outcrop, as covered by the porphyry, was at least a mile in length, and from one to two hundred feet in width, of solid, gold-bearing material.

Much of the conglomerate has been cut away by the formation of the present topographical conditions, and we can only construct the original contact plane by noting the different points at which it intersects what are now hills.

The appended sketch is an approximate section taken perpendicular to the Homestake vein

and extending eastward to the limit of the gold-producing territory; in all, perhaps a mile and a half in length. It shows how small a portion, comparatively, of the old sea bottom remains. From it we see, also, that the site of Central City was once overlaid by a placer—probably richer than the mines in the hills on either side, which have yielded so much gold. The contact plane has a dip of about ten degrees away from the Homestake vein. First considering the gold which remained in the matrix of gravel, we will afterward endeavor to show what became of the gold again set free during the disintegration of the conglomerate. The larger portion of "cement gold" (using the local term for convenience) has been taken from the ridge shown in the sketch between Deadwood and Black Tail gulches.

Ore mined from this ground is said to have milled as high as fifty dollars per ton, and the stratum lying close to the bedrock was exceedingly rich, as is generally the case where the ore pays at all. Small channels and depressions caused local concentrations, and these channels were generally followed in the process of mining. The ore was hard, and generally required blasting. This condition was very advantageous in studying the character of the deposits, since large blocks could be taken out and examined in detail. If the term

Jan. 15, 1884.—Jupiter at 17h 11m G. M. T.

might be used in such a sense, these were fossil placers, in which the most minute relations were carefully preserved, although originally existing in a very unstable material.

In general we find much the same variations of quantity as are shown in the ordinary gravel placer. The local channels referred to show the same alternations of rich and poor material, due to different conditions of current, and the universal occurrence of the greater part of the gold near the bed rock.

The cementing material of the conglomerate was generally oxide of iron, and the gold which had lain on the bed rock was often attached to the overlying boulders by this medium. In general, where conditions had been such as to allow the subsidence of other materials of high specific gravity the gold was most abundant, ordinarily with large quartz boulders or with pebbles of hematite. The latter were seldom found without gold being attached to them, the pebbles themselves having a smooth, polished surface. In general, the position of the gold was always such as to point to its great specific gravity as the locating cause, and not to solution or precipitation. In fact, the many curious positions in which I observed the gold were such that no satisfactory explanation could be found except the one noted above. Upon one

APPROXIMATE GEOLOGICAL SKETCH FROM HOMESTAKE VEIN, EASTWARD.

quartz boulder, which had lain directly upon the schists, I found, after removing the decomposed talc from the bottom, that grains of gold of almost exactly the same size were arranged in ribbon-like layers in such quantity that half an ounce could probably have been covered by the hand. Each grain of gold is generally covered with a thin coating of oxide of iron, which needs a blow to loosen it.

Small basins or enlargements in these channels are sometimes found, which are perhaps one hundred feet across, in which the gold has been deposited in larger quantity. These have the appearance of having been formed by whirlpool action.

The fineness of this gold is greater than that of the quartz veins, as is generally the case with placer gold. This is a perfectly rational condition, since from the time it is liberated from the vein the gold is subjected to the action of various chemical agencies, which naturally act more energetically upon the silver than the gold of the alloy. In the case of the gold in question, we have not only the ordinary conditions, but the added ones that must have resulted from the saline waters, and the solutions of iron which produced the large amounts of oxide of iron noted. In one case the latter amounts to a bed several feet in thickness, lying over the gold cement. Combined with these chemical agencies was the heat produced in later times by the porphyritic intrusions and overflows.

Dark Transits of Jupiter's Satellites.

At the meeting of the California Academy of Sciences held on Monday evening, March 3, 1884, Professor Davidson, the President, called attention to the observation of the black transits of the third and fourth satellites of Jupiter made by Messrs. Burekhalter and Hill and himself.

The first observation was upon the transit of the third satellite and its shadow over the disk of the planet on the 15th of January, at 9 hr. 1 min. local time, by Professor Davidson. It is illustrated in figure 1, wherein the small dark disk is the shadow of the satellite with the partially dark image of the satellite itself three or four diameters to the right. The figure gives the appearance of the planet, etc., in the inverting telescope.

When it was examined with powers of 120 to 150 diameters the image of the satellite itself showed nearly as dark as the shadow, but not quite so large. After making the first drawing the atmosphere was steady enough to admit using 255 diameters. This was twelve minutes later, and then the satellite was seen as a circle with a segment of two-thirds the disk bright white and the other segment of one-third the disk dark or black. Upon again testing with

Jan. 24, 1884.—Jupiter at 19h 54m G. M. T.

the 120 power the same effect was revealed. The two were moving along, and upon the dark-brown red belt which has been persistent on Jupiter for some time, and yet they were very markedly black. The shadow was like a drop of ink. The satellite preceded the shadow about 22 minutes of time. The observations were made with the 6.4 inch equatorial.

The President then read two short memoranda furnished by Messrs. Hill and Burekhalter upon their observations of the black transit of the fourth satellite on the 24th of February. The observation of Mr. C. B. Hill was made at the Davidson observatory, and that of Mr. C. Burekhalter at his observatory in Oakland, and therefore they are independent observations of the same phenomenon.

Mr. Hill reports: "On turning the equatorial on Jupiter about eleven and one-half hours I was surprised to see what was apparently the jet black shadow of one of the satellites. On looking it up in the Ephemeris to see what satellite it could belong to, I found that the only phenomenon in progress was the transit of IV, the shadow of which should not come on until 15 h., 43 m., or four hours later, so that this was evidently a "black transit" occurrence. The "seeing" was only moderately good, and as the edges of the planet were not sharp, I concluded there would be no use in

note 2, to illustrate his observation. It is a reproduction of the original in the note book.

Mr. Burekhalter writes: "Last night I observed the transit of Jupiter's fourth satellite; the first contact was about two minutes later than the almanac time, and the satellite was about eight minutes getting completely on the planet's disk. The air was very steady and definition good. The satellite entered the white portion just south of the great, dark red belt. I observed the satellite for about five minutes after the internal contact, and saw nothing unusual, but on the contrary could only see the bright satellite on the white belt with difficulty. At the almanac time of 11 oc. dis. (8 h. 53 m. L. M. T.) Mr. W. H. Lowden took the instrument to observe the phenomenon, and he at once announced that there was a shadow of a satellite on the planet. Thinking he must be mistaken I again looked and found, as he had said, a black spot 'as black as a drop of ink,' and I then noticed that this spot occupied about the position of the satellite then in transit. I then thought I must have made an error, but upon referring to the Ephemeris, I found that no shadow should be on at that time, and that consequently it must be the fourth satellite projected on the disk as a black spot instead of the usual bead of light. This phenomenon so occupied our attention that the oc. dis. was allowed to pass unnoticed. Thereafter we watched the spot at intervals for nearly an hour, during which time it remained absolutely black."

It will be noticed that Mr. Burekhalter observed the satellite enter as a white disk on the body of the planet, and that it was subsequently seen black. He observed with a ten and a half inch reflector, but does not report the magnifying power employed, and has furnished no drawings.

Mr. President then referred to the earlier notices of these or similar phenomena. It was first reported by Cassini in 1665, and afterwards more fully described by Maraldi, in 1707.

It was not again mentioned until 1796, perhaps from inattention to the subject, but more recently the great telescopes have revealed these peculiarities. South saw two satellites on the planet, but of a chocolate color. Bond, on the 28th of January, 1848, at Harvard, observed the transits of I and III. "Whilst III itself was seen as a black spot between the two shadows, and not to be distinguished from them except by the place it occupied, it was smaller than its shadow in the proportion of 3 to 5, not dusky simply, but quite black like the shadow."

Again on the 18th of May, 1848, Bond saw the III satellite enter the disk very bright; twenty minutes later it was hardly perceptible; a little after it was a dark spot; then for two and a half hours perfectly black and nearly round.

The transit of IV on March 26th, 1873, was remarkable for its absolute blackness, and was seen by many observers in England.

Several dark transits of I were recorded in England in 1880, and it is quite likely that the literature upon the subject of Jupiter may reveal other notices.

Several solutions of this curious problem have been offered, and were mentioned by the speaker, but none have been satisfactory.

NOTE.—The cuts are made somewhat darker than the drawings furnished us. The black disk in Fig. 2 should be slightly larger to be in exact proportion.—Eds. Press.

Mechanics' Institute.

The Mechanics' Institute held its annual meeting Saturday evening at the Mechanics' Library rooms on Post street, P. B. Cornwall in the chair. J. A. Baner, P. B. Cornwall, D. A. Macdonald, David Kerr, G. H. Hopps, W. P. Stout and S. J. Hendy, who were elected Trustees at the last meeting, were duly installed. After the meeting the Trustees withdrew and organized as follows: P. B. Cornwall, President; David Kerr, Vice-President; J. A. Baner, Treasurer; W. P. Stout, recording Secretary, and S. J. Hendy, Corresponding Secretary.

The retiring Treasurer rendered his report, which shows that the receipts from the library amount to \$18,770.58; receipts from the Pavilion, including receipts from the eighteenth Industrial Exhibition, \$45,838.95; receipts from the Lick Trustees, \$10,000; money on hand at the beginning of the year, \$2,560.22, the total receipts amounting to \$75,169.75. The disbursements were \$97,181.03, leaving a balance of \$7,986.74. The institute's property, consisting of library, Pavilion and property on Post street is valued at \$608,539.50. The liabilities amount to \$164,500, leaving the net assets at \$444,039.50. The President reported the Institute to be in a most gratifying and flourishing condition.

Horace Wilson, the librarian, submitted his report as follows: During the year 748 members were received, or 338 more than last year, making a membership of 1,919 persons at the present time. There were 2,033 new volumes added to the library during the year, making a total of 34,673 volumes in all. The circulation of the library was increased from 44,236 volumes to 51,464 volumes.

The new Board of Trustees were authorized to make preparation for the nineteenth industrial exhibition.

REPORTS from Aurora say that the Silver Lining mine is turning out much better than expected by the contractors who are at work on the property.

Industrial Education.

This is one of the subjects which the people rightly regard of the highest importance, and the reformation of the public schools so as to include elementary industrial instruction is now a live theme. As we lately stated, an experimental effort in this direction is being made by the Oakland School Directors. The following is a paper read by C. M. Drake of Santa Paula, Ventura county, at the State Teachers' Association, lately held in this city:

The subject we are discussing this afternoon is one of great and growing importance. It is one which has already been decided in the affirmative by some of the most enlightened nations of Europe, and it is now knocking at our doors and demanding admittance into our educational system.

This is a practical age, and it is fashionable for literary men to condemn it as being too eager for money making. Now I am heretical enough to believe that money making is one of the most important pursuits of man, one of the things of prime importance to us as individuals. I have very little respect for a man who devotes all his time to money getting, but I have still less regard for one who will not earn his own living. The endeavor to live upon the earnings of others is the cause of far more than half the crime in the world.

If a person does not know how to make a living his education is comparatively worthless. I think all will acknowledge this. Again, the more easily a man can earn a good living the more time will he have to devote to those things which are higher and more refining than mere money-getting, and the less desire will he have to engage in dishonorable pursuits.

Civilization could not begin, neither can it flourish in those countries where climate or soil makes life one hard struggle for bare subsistence. So if life has to be one continual toil for the necessities, then the refinements, the cultures of civilization must be left alone.

But a plea for industrial education is not a plea for less work, but for better work, more intelligent work, more productive work. We now try to cultivate the mental part to the exclusion of the physical. The ear and the eye are trained, but they must work with the abstract rather than the concrete; with the ideal instead of the real. The more school culture our children receive the farther they seem to be removed from every-day usefulness; the less fitted to be successful workers in the honest fields of to-day. I could find you, if need be, a score of college graduates herding sheep on our California hills for \$15 a month, competing with boys and Indians. The most useful part of our education is learned outside of the school room, away from that place which is supposed to be especially devoted to the acquirement of useful knowledge. The best half of my knowledge was gained outside of school and in spite of school; and more than half of my school life was wasted over things of little value to me or to my fellow men. As a teacher, I declare that one-third the work we do in the school room is of very little benefit to our pupils. Shall we go on thus wasting the time of our children, refusing to try anything which promises better results, because we are wedded to our old-time idol? The opponents of industrial education claim:

1st. That we have not the time to add so much new work to the already crowded curriculum.

2d. That the public school is not the place to teach trades.

3d. That the great increase of cost which industrial education would necessitate would not be borne by the people.

4th. That we cannot teach all trades, and it would be wrong to select one or two and exclude others just as useful.

I believe these four objections cover the entire ground. Let us examine them one by one.

I. Have we the time to add this new work to our school duties? If we continue to teach what we do in the way that we do, we have not the time in a majority of our schools. But what do our best educators say? All agree that the hours of mental work we require of our children are far too many; that such long continued mental labor is hurtful to mind and to body; that children will actually learn more if required to study fewer hours, as half-day schools have repeatedly proved.

The majority of our high school graduates, the finished products of our present system, are mental dyspeptics, whose shattered nerves, hollow chests, shallow faces, weak, short-sighted eyes, uneven tempers and liability to numerous diseases, speak in the most emphatic tones to those who are not willfully deaf, of the cruel wrong done them by our course of study. They should have had physical labor mixed with their mental work. The country boy who leaves his books in his school-room at three o'clock, walks one or two miles to his home, tends to his stock and other chores, comes back the next morning at nine full of life and energy. I say unhesitatingly, that a teacher who habitually requires his pupils to learn book tasks outside of school hours is too ignorant of the laws of health to be a teacher. I am thankful that public opinion is becoming more and more settled in the belief that school work should be strictly confined to school hours, and not only the pupil's work but the teacher's. When I see a teacher taking home a pile of uncorrected papers I may admire his faithfulness, his in-

dustry and his willingness, but I must condemn his judgment. Better, far better for himself and his school, that he should spend those hours at some manual labor, tending to his bees or his stock, his garden or his woodpile, or taking a tramp of five or six miles to learn something new from mother nature. We teach too much grammar, too much geography, too much arithmetic, too much of many other studies in our common schools. We try to give our children mental food too rapidly for the youthful digestion. We crowd their minds with useless, ill-arranged, indigestible facts. Cut out this needless work, this useless labor, and we shall have plenty of time for industrial education. Combine arithmetic with mechanical labor, chemistry with cooking, natural history with agriculture, and we can make room for all the time we need. It is not the time we lack, but the knowledge of how to employ it most profitably. Our country schools spend enough waste time on arithmetic and grammar alone to give an hour and a half a day to industrial training.

II. Is the public school the place to teach trades? To the question, "Why are we justified in taxing Americans to support public schools?" the reply of educators has been, "To preserve the State; to make good citizens; to save the money which would otherwise go to support jails and penitentiaries." Is there one of these answers that could not be used with increased force in favor of industrial education? Who fills our jails, our State prisons and our poor-houses? Is it the honest, industrious mechanic? The hands of criminals are white with the fear of work; soft with the shame of idleness. The temperate mechanics in the whole United States would not keep even one prison filled. It is because labor is not made a duty and a habit in early life, that so many shun the toil of honest trades and prefer to dawdle behind a counter or grow pale over a ledger. *It is considered so much more respectable to measure a yard of ribbon than to hammer out a plowshare.*

III. Would the people stand the increase of taxes necessary to start this new education, when they are already taxed almost beyond endurance? They are taxed far too much, I do allow. But it is not the two % State and county tax that is grinding them to poverty, though this tax is far higher than there is any need of. I lately wanted to build a \$1,000 school-house in the district where my farm is. The people said, "We cannot afford it." Said I, "Give me your tobacco money for one-half the number of years your bonds will run, and I will pay every cent of your school taxes. Nay, more, I will seat and furnish your school-house as no other district in Ventura can afford. I will buy a bell that can be heard all over the district. I will even carpet the room with Brussels, and I will make money by my offer." "I should say you would," said one objector, "whose taxes would not have averaged \$3.25 a year; I spend \$50 a year on tobacco, and I don't use near so much as some of my neighbors." Strong drink costs three times what industrial education would if we had to double our taxes. Some districts, some people, will object to any new cost of education, but I know there are hundreds of districts and thousands of people in California that are ready now to put their hands into their pockets and help along this good work of industrial education. Nor would the increase of cost be very great. An acre or two more of land, a few tools, a little material to start with, and the cost would be more than repaid in a single generation. Nay, it would return like the seed sown into the mellow ground with a 7x7 increase.

IV. What could we teach that would benefit all? We cannot make all the pupils carpenters, or blacksmiths, or farmers, and it is not fair to give one employment the preference over another equally important, or force a pupil to learn a trade he will never follow.

At first sight this seems to be the most reasonable objection of the four, but I think its weight disappears if we look at the matter aright. The musician who learns to play well upon any one instrument can learn to play others with comparatively little labor. A student of other languages finds that each new tongue makes the other easier to acquire. So a good carpenter can learn the blacksmith trade in one-half the time it would take him had he no mechanical education. But there is a certain amount of mechanical skill which all should possess, certain things that all should know.

Will any sensible man say that his wife should not know how to make a good loaf of bread, or to sew up a torn garment with neatness and dispatch? Does any woman wish her husband to be unable to saw a board straight, or not know enough to drive a nail in without pounding his fingers? Must he go for the tuner if a bit of dust gets in the organ-reeds, or the hardware man be sent for if the stove pipe comes apart?

There are many things happening every day of our lives where a little mechanical knowledge would save money, time and temper, and the last is not the least desirable of the savings. But of far more worth than the mechanical skill acquired would be the habits of honest work the children would acquire. Though a Lincoln may not split rails in mature years, nor a Garfield continue to tread the towpath, yet the benefits of their early toil lasted them until the last day of their lives. The education of hard work is not sufficiently appreciated.

My colleague has considered the subject more in relation to the city schools, but we of the country districts want to enjoy this new and

better education. Our children are taught how to work, but seldom why they work or even the best way to work. But the opponents of industrial education say that it is impracticable to introduce manual labor employments in our public schools. Let us see if it is. Boston and other cities have organized successful sewing classes, which teachers said did not interfere with other school duties. Miss Corson has shown that the science of cooking has no difficulties which would debar it from the school room. Though this is not the time or place for methods, yet industrial education must be shown to be practicable at a reasonable cost before it will be adopted. We cannot afford in most places to imitate the \$100,000 manual training school building in Chicago, nor the new department just started in Girard College, nor the \$500,000 industrial school in Virginia. Such schools have their place, and a noble place, but we want something for small schools—for light pockets.

I will give one example out of the many which could be given of an employment, which, if properly carried out, would give pupils in country schools a good, industrial education, and a scientific training as well. I refer to apiculture. Lessons in natural history, in the use of tools, in experimental observation, in the laws of breeding, and in many other things useful to all, could be given by a small apiary connected with the school. In most places, such an apiary properly cared for would pay far more than the expenses of running it, and repay the first cost in three years.

But time alone can settle what it would be best to teach, and how it would be best to teach it. I wish merely to show that an industrial education is practicable, at a reasonable cost. It will increase the cost, but whatever is worth having, is worth paying for, and our ignorance of industrial training is constantly costing us enormous losses of money and of health, of comfort and of culture.

As the years go by I often recall the words of my wise Quaker father, spoken to me when I desired to leave the farm to study my profession. He said: "In coming years thee will not regret the time thee has spent upon the farm; and thy knowledge of farm work will make thee feel independent of any school trustees. For should thy profession at any time fail thee, the plowhand can give thee an honest livelihood." And I feel glad to-day that I can earn a good living outside my school-room. I have spent half my life teaching in district schools, I have studied on this question of industrial education for years, and I feel sure that industrial education, including the elements of trades, could and should be given in our public schools. The way is growing clearer; public opinion is rapidly advancing in that direction, and we may all live to see the time when teachers more enthusiastic, more competent than we, shall show the way to the education of hand as well as head; of body and mind alike. The coming generation will not, under such training, think manual labor a task to be slighted, a drudgery to be avoided, but hoidly work shall be the handmaid of mental labor, the veritable goddess of hope, instead of the last resort of despair.

Smelting Notes From Chihuahua, Mexico.

(CONCLUDED FROM OUR LAST.)

In Treating Some Ores

("San Francisco del Oro" mine, for instance), which carry heavy amounts of zinc-blende, a loss of 25 per cent of the litharge charge occurs. This material is brought from a distance, and costs, laid down at the works, \$42 per ton. As equal amounts of litharge and ore are charged into the furnace this loss augments the cost of smelting \$10.50 per ton, which, added to the \$6.80 above, brings the total up to \$17.30 per ton. Probably the expenses for motive power, preparation of ore, and general outlays connected with the works, will increase these figures to \$18.50, exclusive of refining, i. e., when treating "black jack" ores. From data obtained at another smaller establishment, when galena ores were formerly operated upon, the total cost of smelting, per ton, summed up as follows:

Labor.....	\$2 80
Fuel.....	5 20
Motive power.....	2 00
Total.....	\$10 00

Both of these estimates are rather crude. The cost of repairs on furnaces is not included, neither are any of the little expenses incidental to metallurgical operations of this kind. But the main items, fuel and labor, are sufficiently near for practical purposes, and the fact is made clear, that in these little shaft furnaces, to construct which costs a merely nominal sum, very refractory sulphuretted ores are successfully smelted without preliminary roasting, at a cost of from \$8 to \$10 per ton. Where almost pure zinc-blende is treated, and a heavy loss in the fluxing litharge occurs, these figures are doubled. When a moderate amount of galena is present in the ore, the litharge constantly accumulates, and is sold. A knowledge of these facts would often help our Western prospectors in developing their claims, where they now sit idly by awaiting the often tardy advent of capital. The nature of the material from which these furnaces are built does not admit of long campaigns; usually they last but ten or twelve days.

Cupellation hearths, built also of adobes, are used to refine the base bullion produced by the

shaft furnaces. These are very simple in construction, requiring only a few adobes, some ashes, and clay.

Cost of Constructing One Pair of Cupellation Hearths.

Adobes for tests:	
1800 pounds for two furnaces.....	\$1 00
Labor used in construction:	
1 man, one day, at 80 cents.....	\$0 80
3 men, one day, at 40 cents.....	1 20
	\$2 00
Labor putting in tests:	
1 man at 80 cents.....	80
3 men at 40 cents.....	1 20
	\$2 00
Clay for tests:	
600 pounds.....	80
200 adobes.....	1 00
Total.....	\$8 00

The adobes which serve as roofing are somewhat larger than the others, being 30 inches by 12 inches and 3½ inches thick. They are made from selected clay, and dried under cover so as not to show sun-cracks; they stand four weeks. The tests are made of ashes taken from the ash-pit of the furnace itself, and mixed with sifted clay, in the proportion of 3 parts (by measure) of the former to 1 part of the latter. Oak wood ashes are preferred, as they do not cut out so readily, and the tests are tamped in, very solid wooden poles being used for this purpose. The furnace, when complete, occupies a space 5 feet wide by 5 feet high and 8 feet long, the test holding about 750 pounds of base bullion and matte. The matte, which forms in a thin cake upon the surface of the lead, when tapped from the shaft furnace, is thrown in upon the bath while refining, and runs down with it. This dissolving of the metallic oxides in the litharge constitutes the main expense of the operation, consuming much time and fuel. Six marks of silver, at eight ounces, result from cupelling 1,500 pounds of a mixed charge of lead and matte, the whole operation lasting twelve hours. Oak wood is used as fuel, costing 20 cents per 200 pounds. A test of this description requires to be built every month, slight repairs being necessary after every charge.

Cost of Refining 3,000 Pounds of Lead and Matte.

One day's run:	
Two refiners at 60 cents.....	\$1 20
Fuel, 1,500 pounds oak.....	1 80
Labor.....	50
Materials used in repairs.....	10
Total.....	\$3 00

This estimate for fuel is rather low, and it might be well to add \$1.20 to the above figures, so as to include surplus fuel, rebuilding, blast and other incidental expenses. Still, then, we have the astonishingly low result of \$4.80 for 3,000 pounds, or \$3.20 per ton. The loss in lead during this operation amounts to 11 per cent. The silver obtained is melted down in a furnace similar to those used throughout our Western country for a like purpose, but built of adobes. In the place of costly graphite crucibles, old quicksilver flasks are made use of in this melting, a flask lasting for fifteen to twenty bars, according to the strength of the welding. The bars are not allowed to contain over 1,080 ounces, and by using two flasks and one furnace twenty can be cast in one day. Pine coal is used in the melting furnace. The bar silver runs from .970 to .980 fine.

The ore, heavy in zinc, is partially roasted in kilns at the mines before being brought to the smelters. These kilns are 10 feet high, 12 feet long, and four feet broad. On the bottom are two air canals, covered with pieces of strap-iron set on edge, which act as grate-bars. On these wood is piled a foot high, which, in turn, is covered with ore, about 15 tons, until the kiln is two-thirds full. One other layer of wood having been thrown in about the middle of the charge, the front of the kiln is sealed up and the charge fired. The exit for the fumes is quite small, in order to limit the access of air from below. The ore loses about 10 per cent of its weight during this operation, which is represented to cost 22 cents per ton. The oak wood used is approximately 2 per cent to 4 per cent of weight of the ore charged, and costs \$2.20 per cord.

The Entire Cost

Of the roasting, smelting and refining operations to which this rebellious ore is subjected, sums up to, approximately, \$20 per ton, the product being bar silver, .980 fine.

The system is characterized by two features, the small quantity of material it is possible to operate upon, and the consequent waste of time; it has, therefore, little to commend it, except for operations on an experimental scale. It owes its success mainly to cheap fuel and labor, but both of these commodities are limited, and prevent extended operations. Lead is sacrificed because of the absence of iron; still, when we consider the quality of the material treated, the small amount of lead ore mixed with zinc-blende and antimonial and arsenical compounds, the result is very creditable. At one small works I found them working the blast by man power, the whole concern being of home manufacture, bellows, furnace, and all. I am indebted to Messrs. Beckman & Stork, of Santa Barbara, for much of the metallurgical information contained in the above.

THE snow-sheds on the Central Pacific road, despite the efforts of the company to clear them, are, many miles of them, covered with snow from six to twelve feet deep, and are liable to yield under the enormous pressure.

The New Gold Amalgamator.

In the *Transcript* of Wednesday last was made mention of a new gold saving machine being exhibited in this camp. Yesterday we received a call from Messrs. Irvin & Campbell, the inventors, from whom was obtained a detailed account of its workings. It is an invention for saving the fine gold and flour quicksilver generally carried off in the tailings from gold mines of all descriptions and proving a total loss. This is a matter which has puzzled the brain of the miner and scientist for years, and although many machines have been invented heretofore none of them have succeeded, so far as we know, in doing the work they were intended to. Only the coarsest and heaviest gold has been caught and held in the quicksilver, the float and flour gold passing off with the water and sand. As fine gold composes the major portion in many mines, it has been the desire of miners to secure some process that would stop this leakage and enhance the value of their properties. Messrs. Irvin & Campbell have been exhibiting their machine through the mining districts of Oregon and California since the early part of last October, and we are informed it has given general satisfaction wherever operated. It is simple in construction and easily managed. The pulp or tailings are passed into a hopper and thence down through a U crook in which is deposited from two to ten pounds of quicksilver, according to the size of the machine required. Thence it passes up into a cast iron box in which is placed a perforated amalgamating plate. At this juncture the quicksilver is returned and the pulp passes into the overflow and is cast off. By the peculiar construction of the gold-box there are eddies and under-currents made, which assist materially in retaining the precious metal. To a casual observer it appears simply wonderful in regard to its ability to retain the amalgam and pass off the debris and sand.

The principle appears to us to be correct, and we do not see how a particle of gold can escape after passing through so large a body of confined quicksilver. If the machine will accomplish all that is claimed for it, it will bring about a revolution in the mining business, as it is quite simple and comparatively inexpensive. The inventors are giving the mining public every opportunity to see it in operation and carefully scrutinize its workings. They invite the severest tests by expert miners. They go from here to-day to Grass Valley, where they will remain a few days. —*Nevada Transcript*.

Fluorspar.

Fluorspar is found in more or less quantity in almost every State and Territory, but not very frequently in workable amount. No statistics of production are accessible, and the estimates of dealers vary widely; but the amount annually mined is very considerable, possibly reaching 5,000 net tons per annum. Fluorspar is used as a flux and as a glaze in the pottery trade, and in the production of hydrofluoric acid for etching. The greater part consumed in this country is from home sources, little now being imported; and the domestic mineral is reported to be superior. Its spot value ranges from \$10 to \$20 per ton. Indiana and Ohio are said to lead in point of production. New York, Delaware, New Hampshire, and Kentucky also contain fluorspar in noteworthy amount.

Fluorspar in the Rocky Mountain Region.

Fluorspar occurs massive in wide metalliferous veins near Bear creek, in Jefferson county, and on James creek, Boulder county, Colorado. The white, green, pink, and purple colors are common, and often all these colors occur in a single specimen. The mines at Bear creek have produced some 600 tons of fluorspar, which was sold to the Boston and Colorado Smelting Works at Black Hawk before they were removed to Argo. The supply from this point is exhausted. On James creek the veins of fluorspar are undeveloped, as there is no demand for it as a flux. Fluorspar occurs frequently in the ores of Montana, Wyoming, Colorado, and New Mexico, but only in small quantities. It is used as a flux in local smelting operations, but is not much in demand. Fine cabinet specimens come from Crystal Park, El Paso county, some showing crystals 10 inches across.

URANIUM.—Uranium in the form of the mineral pitchblende (uraninite or gummite) occurs in Jefferson and Gilpin counties, Colorado. In Jefferson county thin seams of it have been found, but the mineral is in too small quantity to be economically valuable.

In sinking the shaft on the Wood lode at Central City, Colorado, in 1872, a lenticular mass of pitchblende was cut through and quite a large quantity of it was thrown away before its character and value were known. Afterward the remainder, amounting in all to three tons was extracted under lease by Richard Pearce, Esq., of the Boston and Colorado smelter, and was sold in England at an average price of \$1.50 per pound. The mineral was quite pure, and averaged 70 per cent of the proto-sesquioxide of uranium.

Uranium is used in considerable quantities in chemical operations and in porcelain painting, affording a yellow or black color, according to the process of baking. The principle supply is obtained from the mines at Joachimsthal, Bohemia, and is quite limited.

USEFUL INFORMATION

Peanut Flour.

No doubt ere long "peanut flour" will be an important product of the South. Virginia is set down this year for 2,100,000 bushels, Tennessee for 250,000, and North Carolina at 135,000 bushels, these being the chief States engaged in their cultivation, and those in which it was first introduced from Africa. In Virginia they are called "peanuts," in North Carolina "ground peas," in Tennessee "goolbers," and in Georgia, Alabama and Mississippi "pinders." Virginians are beginning to turn the peanut into flour, and say it makes a palatable "biscuit." In Georgia there is a custom, now growing old, of grinding or pounding the shelled peanuts and turning them into pastry, which has some resemblance, both in looks and taste, to that made of cocoanut, but the peanut pastry is more oily and richer, and, we think, healthier and better every way. If, as some people believe, Africa sent a curse to America in slavery, she certainly conferred upon her a blessing in the universally popular peanut, which grows so well throughout the Southern regions that we shall soon be able to cut off the now large importation altogether. —*Savannah Telegram*.

BOMBAY MORE CROWDED THAN LONDON.

One of the results of the Indian census, the various returns of which are now being collated, is to show that Bombay, the second city in the British Empire, is more crowded than London itself. The density of population in London in the most densely peopled parts is less than the density of twelve of the most crowded sections of Bombay, with a population of more than 430,000 people. These sections have an average population of 458.57 per acre. In Bombay the average of population is about 52 per acre; in London 49. The extreme in London rises to 222 per acre, whereas in Bombay it rises to 759. The population of the sections in which the crowding is double that of the most crowded divisions of London is equal to more than 37 per cent of the total population, but the area of these sections is only 3½ per cent of the island. In other words, 37 per cent of the population are crowded upon 3½ per cent of the surface of the land.

LOOK ON THE BRIGHT SIDE.—"It is better for all to cherish a feeling of hopefulness," says the *Industrial World*. "It is more natural to indulge in cheerful than in desponding predictions. Many who are closely scanning the future discern numerous encouraging signs. The wonder is that there are not more who do so. When we come to think of the magnitude of the country, the diversity of the wants of the people, the wealth of the nation and the facilities we have for commerce and manufacturing, it is not surprising that the intelligent observer should see a how of promise in the future. As surely as the morrow's sun shall rise, so surely will prosperity return to the country. The time of this return may be much nearer than many anticipate. This being true, how idle is it to continue in predictions of evil, especially since such predictions are promotive of the evils feared."

PRESSURE OF THE SEA.—If a piece of wood which floats on the water be forced down to a very great depth in the sea, the pressure of the surrounding liquid will be so severe that a quantity of water will be so forced into the pores of the wood, and so increase its weight that it will be no longer capable of floating or rising to the surface. Hence the timbers of ships, which have foundered in a deep part of the ocean, never rise again to the surface like those which are sunk near the shore. A diver may, with impunity, go to a certain depth in the sea; but there is a limit, beyond which he is subject to danger. For the same reason it is probable that there is a depth below which fishes cannot live. They have, according to Joshlin, been caught in a depth at which they must have sustained a pressure of eighty tons to each square foot of their bodies.

ROUGH ON ENGLISH CARS.—The London *Engineer* says of some of the passenger cars on the Southeastern Railway, that "they are square, low-ceilinged, cornered everywhere, cold, straight, draughty, noisy, wandering, vibrating, stuffy, dirty, dark, dingy, creaking, loose-windowed, worn-out, dangerous old coaches; and plenty of the Southwestern stock is nearly as bad." In addition to all this badness, Colonel Rich, one of the Board of Trade inspectors, "observed that the London & Southwestern Railway Co.'s gauge for the wheels of the rolling stock is about one sixteenth inch to one thirty-second inch wider than the permanent-way-gauge, which was given to him to gauge the road."

REMOVING STAINS FROM COTTON OR LINEN GOODS, CURTAINS, ETC.—Grease spots are best removed by soap; stains from oil colors, as a rule, do not resist the action of a mixture of soap and caustic potash. If spots of tar or axle grease are unaffected by soap, they will usually yield to the solvent action of benzine (so-called), ordinarily ether, or of butter, which may afterward be removed with soap and water. For ink stains, diluted hydrochloric acid, which must subsequently be carefully washed out, will

generally be found effectual. For the same purpose oxalic acid or salts of sorrel (hydrogen potassium oxalate) may also be employed, and that most economically, in fine powder to be sprinkled over the stains and moistened with boiling water. The action of these solvents may be hastened by gently rubbing, or still better, by placing the stained portion of the fabric in contact with metallic tin. If there is much iron rust to be removed, Dyer's tin salt (stannous chloride) will perform the work at less expense than the oxalic acid compound. Another solvent for such stains consists of a mixture of two parts argol with one part powdered alum. Stains caused by red wine, white wine, and fruit juices in general are treated successfully with salts of sorrel or with a solution of hypochlorite of soda. The latter especially must be carefully removed when the ends have been attained. Another well-tried plan, when space is available, is to spread the stained fabric on the ground in the open air, smear the spots with soap, and sprinkle ground potash or common salt upon them. Water is added and replaced when lost by evaporation. After two or three hours' exposure the whole fabric may be washed, and will be usually freed from its stains. —*Industrial Record*.

NEW GRAIN TESTER.—To satisfactorily test the contents of a grain sack, without the necessity of emptying it, Nobbe's proving staff is offered, by means of which samples from any desired part of a grain filled sack can be quickly obtained. The staff is placed in the grain, and by revolving the outside layer three divisions (upper, middle and lower) are thrown open. The instrument being now shaken, grain falls into the openings, and the staff being withdrawn from the sack, may be easily examined. —*Muelter Zeitung*.

NO MORE BELL CORDS.—It is said that the Pennsylvania railroad is experimenting with a device intended to supersede that most aggravating and inefficient affair, the bell-cord. The improvement communicates by air pressure, with a small whistle in the locomotive cab, and the condenser signals by a small button, near the car door.

TO DISSOLVE AMBER FOR VARNISH.—Amber is soluble in sulphuric acid and in pure alkalies. In making varnish amber is generally brought into solution by heating it, then adding the oil, and finally stirring in turpentine as it cools.

TO REMOVE INDIA INK.—Blister the part with a plaster a little larger than the mark; then keep the place open with an ointment for a week; finally dress it to get well. As the new skin grows the tattoo will disappear.

WEIGHT OF A CROWD.—A densely packed crowd of human beings will average about 65 pounds weight to a square foot.

GOOD HEALTH.

Health of Cities.

Longevity and premature decay are doubtless influenced by the food and general habits of the people, and by temperature and other local atmospheric conditions, although all these may be largely modified and brought under control by attention to sanitary laws and appliances. Artificial atmospheres are, in fact, created in large cities according to the character of the building, the air space allotted in them to each inmate, and the mode of ventilation and warming, as well as by the width of the streets, the sewerage, and other sanitary arrangements. Moreover, the hereditary constitutions of the citizens become in after generations affected by the condition of the cities in which they and their forefathers have lived.

The facts and figures before us point to many of the causes for so great a variation in the death rate as has been shown to exist in different cities. A high death rate will in most cases be found to be the companion of defective house accommodation, ventilation, water supply, sewerage, or scavenging. Thus, for instance, St. Petersburg, with a population of nearly a million, and the high death rate of 35.2 per 1,000, is without sewerage, and its water supply is taken from the river Neva, more or less contaminated by the percolation from the subsoil. Cairo, with a death rate of 37 per 1,000, is supplied with water from the Nile, having no sewers, and the sewerage filtering through the subsoil into the Nile above the water intake. Vienna, with a death rate of 29.2 per 1,000, has an average of 60 people in each house, or twice as many as in Paris, while the ratable value of the houses in Vienna is only one-sixth more than those in Paris. Pekin, with a death rate of 50 per 1,000, is without proper sewerage, water supply, street cleansing, or other proper sanitary arrangements.

SUGAR AS A DRESSING FOR WOUNDS.—Dr. F. Fisher, writing in the *Centralblatt für Chirurgie*, says that in the Strassburg Hospital, where he is assistant in the surgical department, Professor Lucke has since May used powdered cane-sugar as an antiseptic dressing to wounds. Hitherto it has been used in combination with naphthalin (equal parts) or with iodoform (one part to five of sugar). In cases of wounds united by suture the mixture is put up in gauze and applied to the part; where there is loss of skin, the sugar

is sprinkled over the part. The sugar-dressing is fixed in place by some layers of gauze deprived of fat, over which a layer of gutta-serena is applied, and the whole is secured by a bandage. The sugar-dressing may remain from eight to fourteen days without the sugar dissolving; the secretion from the wound is equally distributed through the sugar, and it is only when the layer of sugar is too thick (more than one-fifth of an inch) that lumps are formed. The wounds have a healthy appearance under the sugar, the dressings are not offensive, and bacteria cannot be found in them. Healthy granulations, with no tendency to bleed, are developed, and cicatrization proceeds rapidly. In wounds united by suture, healing by the first intention has always been observed. Dr. Fisher is not able to say whether the sugar is decomposed, or what new products are formed.

BEEF JUICE VS. BEEF TEA.—Prof. Roberts Bartholow, of the Jefferson Medical College, says: "Nothing has been more conclusively shown than that beef tea is not a food. It is nothing more than a stimulant. The chemical composition of beef tea closely resembles that of urine, and it is more an excrementitious substance than a food. Beef juice is quite a different thing, and quite nutritious." It may be prepared as follows: "The lean part of the beef should be selected. This should be cut into thick pieces about the size of a lemon squeezer. The pieces should be next placed upon a hot coal fire for a moment, to sear the exterior; the meat is then transferred to the lemon-squeezer, which has been warmed by dipping in hot water, and the juice pressed out and allowed to flow into the glass, which has also been heated. The juice is seasoned with a little salt and Cayenne pepper, if the patient desires it, and taken immediately. In this way the nutritious elements of the meat are obtained, and the slight scorching develops constituents which give the peculiar flavor to cooked meat." This is for a diet, the principle of which is the administration of those elements which are disposed of in the stomach, and do not require the aid of the intestines in their digestion.

SNAKE BITES AND HYDROPHOBIA.—In a recent lecture in New York, Dr. Woodbridge said: "In case of a bite of a venomous serpent, the old historic method of sucking the wound with the lips is one of the first things to be resorted to. If the poison is in the circulation, the use of strong brandy or whiskey, in quantities powerful enough to produce intoxication, must be resorted to. The bite of a mad dog should be cauterized at once, by a pencil of lunar caustic or by application of irons heated white. The peculiarity of hydrophobia poison is that it remains in the spot where the bite occurs for several days or weeks, and not until the poison ferments does it become dangerous. Dr. Hewett, a surgeon of London, allowed himself to be bitten no less than eighty times by rabid dogs, each time successfully cauterizing the wound. He fell a victim to his temerity, however, for one day he was found dead with a pistol shot from his own hand. A statement was left in his papers that he had neglected the cauterization too long, and feeling the first symptoms of hydrophobia, he preferred to die without the long agony."

THE USE OF MILK.—The consumption of milk is very much less than it might and should be. One quart of milk contains quite as much nutriment as one pound of average beef, and costs half as much money. Farmers use comparatively little milk, and much less than they could very profitably. Milk and crackers or bread—when it is sweet—make a most wholesome and nutritious food, and if used regularly for one meal every day would be found far more desirable and satisfactory than any other food. The average consumption of a family who purchase their milk is not more than one pint per day, and the majority of farmers use milk only in tea and coffee and rarely as food. Two or three quarts of milk a day might be used in every family with great benefit and economy. With crackers, bread, rice, sage or tapioca, it makes the most delicious puddings, and when sipped slowly while one is eating a cracker or a biscuit it makes a light supper, which will encourage restful sleep at all seasons, but especially in the warm weather. —*New York Times*.

LENGTH OF LIFE INCREASING.—Dio Lewis thinks that before the year 2,000, centenarians will be very common, and even diamond weddings not very rare. He bases his belief on the fact that during the first six months of the present year 509 persons died in Philadelphia who had lived to or beyond the age of 80, against 489 in 1882, and 449 in 1881. Moreover, he tells us that in 1816 the average length of life in Boston was 21 years; in 1874, 42 years.

PROMPT CURE OF RINGWORM.—R. W. Taylor, M. D., in the *Journal of Cutaneous Diseases*, reports the best results from the use of a paint composed of a tincture of myrrh and four grains to the ounce of bichloride of mercury. Other skin affections are cured by the application of this remedy.

TO PREVENT LEAD POISONING.—Freedom from the risk of lead-poisoning by using glazed earthenware is said to be secured from varnishing the glazed surface with borosilicate of lime.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

DOYLE.—Amador Ledger, March 6: D. H. Sawyer, owner of the Doyle claim who went East last fall for the purpose of enlisting capitalists in the development of the mineral resources of the county returned to Jackson Friday evening of last week. He is going to have a test crushing of ore from the Doyle claim as soon as the Kelly mill can be secured for that purpose. He says, when the paying character of the rock is demonstrated by actual mill process, he will have no trouble in raising all the money necessary to the proper development of the mine. The rock in the face of the big tunnel at Middle Bar, which has been extremely hard for several weeks past, changed a few days ago to a softer formation, consequently the work is progressing more rapidly.

Inyo.

ATTACHMENT RELEASED.—Inyo Independent, March 8: The attachment on the Argus Range Silver Mining Company for a small, and it is said illegal claim, has been released. It is understood that the mill will start up again in a few days on very rich ore, of which there is now 300 tons on the dump and plenty more in sight. The prospects of this company are among the brightest in the county. Edward Reilly and Dr. A. H. Whittell, two of the principal owners, are now with us. They propose to put the affairs of the company in good shape and on a satisfactory financial basis.

ATTRACTING ATTENTION.—In our short visit to Hawthorne and way points this week we heard much talk of the mines of this county, especially at Darwin, and met many old Inyoites who were firm in the belief that this was the coming country. From all quarters comes the information that Inyo is attracting more attention than any other county in California just now.

Mariposa.

COULTERVILLE.—Cor. Mariposa Herald, Mar. 6: The mining interests are not so flattering as we would like, yet we have some of the best mines in the State, and it is only a matter of time as there is no doubt that our mines will be worked. Those that are now being worked are yielding good results. I understand that the Virginia mine is showing up some good rock. They are nearing a fine chute of ore in the upper tunnel, and it is expected that when they get fairly into the vein that the mill will start up, when they will be able to keep the mill running on first-class ore. The Red Cloud mine is running, but with what success I am not informed. The Bandierita and Compromise mines are both working a large number of men on dead work, and as a consequence the mills are standing idle. Since an abundance of water has fallen John L. Scanlon has been doing a good business placer mining on the North Fork, where he has one of the best mines in the county and as good as can be found in any other county in the State. He has his mine well equipped with every appliance for cheap working and must, about this time, be rolling out the yellow dust in satisfactory quantities. God speed, I say, he deserves it. A new quartz mill is being built on Black creek about one-fourth of a mile from Coulterville by Andrew Goss & Co. It is going up with magic speed. It was only commenced about ten days ago and is now almost completed. Of course it is a small mill, but it is a quartz mill.

Mono.

JORDAN DISTRICT.—Bodie Free Press, March 8: S. O. Johnson has been working like a Trojan in Jordan district for three years and it seems that his reward is near at hand. His tunnel is in 106 ft, most of the work being done by himself without assistance. He has run through an immense vein, that gives good assays, all the way across, according to Soderling's certificates.

BODIE.—Free Press, March 11: A greater number of Bodie mines are now being worked than at any time for a year past. A force of men have been employed at the Goodshaw for two weeks, and Sunday morning work was commenced at the Mono. While the Bodie tunnel mill is under lease to the Bodie Con. Company, the work of exploration is continued in that property. Syndicate, Bodie and Standard are working large forces of men, as usual, and what is more to the purpose, so far as stockholders are concerned, all three are paying dividends. The outlook for the district is indeed most flattering. The most serious difficulty with which our mining men have had to contend the past two months have been the heavy and continued snow storms, the last, which occurred Saturday and Sunday, having been the heaviest of all, and the worst one for years. It put an effectual embargo on the hauling of ore from the Bodie mine to the mills. The clear, cold weather of last evening gave promise that regular trips would be resumed to-day. The mine is now fairly choked up with ore ready for reduction, and by reference to Supt. Irwin's report published below it will be seen that rich ore is exposed in more different places in the mine than ever before—and on more levels.

BODIE CON.—The stopes on the 200 level continue to look well, and are now in shape to furnish a large quantity of good ore. The vein in the Vulcan winze is opening out beyond expectations, showing in the bottom four ft of high-grade ore. At a point 60 ft south of winze No. 1, winze No. 2 has been started, and has reached a depth of 12 ft, where the vein is two ft wide, of good ore. Upraise No. 1 on the Gliden vein has been advanced during the past week 12 ft; total height 62 ft, showing six ft of ore.

STANDARD CON.—There were extracted and shipped to the mills during the week 1330 tons of ore, and 700 ounces of crude bullion were received, which will be carried over until Monday, the 17th instant. Upraise No. 2 from south drift No. 2, 1000 foot level, is up 175 ft, showing four and a half ft of vein. The main east crosscut is being retimbered and good progress made. The west crosscut from south drift No. 1, 385-foot level, is in 20 ft, in fair working ground. They have started to drift north from the main west crosscut, west of the shaft, the drift now being in 22 ft. The south winze is down 90 ft; vein four ft wide. There is no change to note in the appearance of the stopes.

MONO.—The work of replacing the old engine and hoisting apparatus at the shaft was begun Sunday morning. When completed some earnest prospecting will be done below, in hopes of encountering a continuation of the Bodie Con. veins.

THE CHAMPION.—Superintendent White is straightening up things and preparing the mine for proper working.

GOODSHAW.—A number of men are at work on the 600-foot level. It is probable that the force will be increased as soon as the condition of the mine warrants it.

SYNDICATE.—The mill is running steadily and shipping bullion to the Carson Mint regularly. The last bar was valued at about \$7,000.

Nevada.

NORTH BLOOMFIELD.—North San Juan Times, March 6: A petition is being circulated in North Bloomfield asking the Board of Supervisors to grant an appropriation from the funds of the county for the purpose of aiding the miners carrying the Woodruff case to the Supreme Court of the United States. Said petition is meeting with a hearty approval in the community. We favor the action taken by the Bloomfielders and think that every town in the county should follow in line. About 20 men are engaged in cleaning bedrock at Malakoff. The Derby mine gives employment to about 30 men. The reported reduction of wages at the Derby proves to be false. An effort was made to reduce the pay for a day's work but the movement was put down by the employees.

MAGENTA MINE.—Grass Valley Union, March 6: Active work is going on at the Magenta in taking out quartz on the 300 and 400 levels. The quartz is of good quality, and shows well in free gold and sulphurets. The quartz taken out from these levels is done as company work, and not on tribute. A crushing of 100 tons of this quartz is now being hauled to the Rocky Bar mill, to be put through as soon as some crushings of custom rock now at the mill is disposed of. There are also some half dozen companies of tributaries at work on the croppings of the Magenta, and from several of the shafts fine rock is being taken out. Yesterday some rich quartz was taken out of the Magenta mine, on the 300 level, 65 ft north of the shaft. The rock was studded with free gold, not of a specimen character, but distributed generally through the rock, which also carried largely in sulphurets. About 400 pounds of this quality of rock was taken out, and it is believed more of the same kind is to follow.

A GOOD RESULT.—A cleanup of 73 loads of quartz from the Slate ledge mine, at Forest Springs, has just been made at Sothern's custom mill, which gave a yield of \$2,301, or about \$30.10 per load. This was the final cleanup of company rock, and gave a handsome dividend after all expenses were paid. The mine is now being operated under lease of Z. Mansau, who pays a certain royalty to the company for each ton of ore extracted and milled.

LOCAL NOTES.—Foothill Tidings, March 8: The storm has greatly interfered with some of the prospects in and around Grass Valley, but nevertheless work is being done. All of the custom mills are busy; the available dumping ground around them is covered with rock, from the different prospects, awaiting an opportunity to be put through the mill. When the weather is good all of the quartz teams are kept at work hauling quartz to these custom mills, and most teams have engagements enough to keep them running all this season. This is a healthy sign and promises a prosperous future for the district. Work is being pushed forward in the Magenta mine, and for the past two days, quartz of extraordinarily good quality has been coming from the 300 level, at about 60 ft north of the shaft. On Thursday the car was bringing ore from the 300 level, all day, and about 400 pounds of this ore was selected from the cars, and locked in the private room at the works, the ore being valuable to be allowed to remain on the dump. On Friday it was the same, the ore being very rich—better in fact than that taken out the day before. Free gold and sulphurets were plainly discernible in almost every portion of the large pieces of the rock, and could be seen with the naked eye at a good distance. The company are engaged in hauling ore to the Rocky Bar mill, where it will be crushed as soon as possible. It is intended that about 100 tons of ore from the 300 level will be put through the mill, and there is a strong probability that the mill will be kept constantly running on Magenta rock. Stopping is going on in the back, and the 300 level is being pushed forward as rapidly as possible. The contract for sinking the shaft 100 ft, for the Imperial Company will be finished about the end of next week, after which a sump will be sunk and drifting commenced. The ore in the bottom of the shaft looks well; so promising, in fact, is it that a crushing will be taken out about the end of the month. Work has been stopped in the tunnel of the Gray Hound mine, and sinking will be commenced on a very promising stringer of the ledge. A party of tributaries will do the sinking on this stringer and the ore will be crushed as soon as the mills can do it. The ore looks well. The New York Hill ground still continues to yield readily to the pick and drill. The company will commence sinking the shaft in a very short time, when new and important developments are expected. Work was resumed on the Greeley-Blackman last Tuesday, and will continue through the summer. The ledge in the tunnel is large and solid, and shows sulphurets and "Black Jack." A Sacramento company own this mine. Messrs. Bourn and Stoddard are still diligently at work soliciting subscriptions for the North Star stock. The mine will soon start up for a certainty. The Empire is looking as well, if not better than ever. A large force of men are employed and the mill is kept constantly running.

DAMAGED BY WATER.—Herald, March 9: A rush of water Sunday morning caused the Rock creek ditch to overflow and a large body of water swept down through the tunnel of Nivens' drift claim on Selby Hill, washing away a large amount of gravel from the dump. The mine was filled with water to such an extent that it will require several days to pump it out. The pay dirt washed away lodged around the boulders in the ravine below and is therefore not a total loss, although it will necessitate much extra work in order to wash it out. It is estimated that the damage done will amount to several hundred dollars. The flood came from a little ravine on the hill above, carrying with it large boulders, bushes and other debris, which dammed the ditch and caused the overflow.

Plumas.

PLUMAS EUREKA.—National, March 6: From Surveyor Kaddie we learn that on Tuesday last the workmen in the Eureka tunnel in the Plumas Eureka mine, made the connection with the work from the Mohawk tunnel. This is an important feature, as it will make a large reduction in working expenses and will bring the works, to some extent, down the mountain. The Eureka tunnel is now very nearly one mile in length. Heretofore the rock which will now go out through it, has been raised through a shaft to the Mohawk tunnel, run in some distance, and then dumped down another shaft into the Eureka tunnel. The connection spoken of will do away with all of this work, and of course, lessen expense.

LA PORTE.—The great Slickens decision has caused no very much excitement here, as it is not believed that mines here will be interfered with, inasmuch as our miners have a reservoir on Slate creek where they impound their tailings.

San Luis Obispo

SAN LUIS OBISPO GOLD MINES.—Tribune, March 8: The localities where old mining is carried on in this vicinity are at La Panza on the eastern slope of the San Jose mountains in this county, and on the ocean beach south of the mouth of the Santa Maria in Santa Barbara county. The gold mining region of the San Jose range is quite extensive, embracing the canyons of half a dozen streams.

Sierra.

RUNNING A TUNNEL.—Tribune, March 6: Two men are employed in running a tunnel at the American quartz claim, located below Goodyear's Bar, near the Mountain House road. One of the parties owning this claim resides in Oakland, and the other in the State of Nevada. The tunnel is being run with a view of striking the extension of the Brush creek vein. One of the gentlemen interested in the enterprise was in Goodyear's Bar a short time since, and expressed himself as being very well satisfied with the indications. There are some good quartz ledges around Goodyear's Bar, and it is more than likely that active steps toward developing them will be taken in the near future.

WORK SUSPENDED TEMPORARILY.—One of the pumps at the Marguerite mine gave way last week. This accident together with the fact that the supply of wood was about exhausted, lead Supt. Myers to suspend work in the shaft entirely. A large pump is now at Nevada City and a turbine water wheel at Truckee awaiting shipment to the mine. As soon as these can be hauled in and placed in working order, operations will be resumed again underground. A supply of wood will also be obtained in a short time. It is unfortunate for the owners of this mine that work is allowed to drag along in such a dilatory manner for the lack of funds at the proper time. The mine was never in a better condition than it is at present, and if the company had been a little more prompt in making arrangements for completing the improvements now under headway, the mill would be crushing at this time and yielding handsome returns. There is and always has been every evidence of a good paying property in the Marguerite mine.

Siskiyou.

ORO FINO.—Cor. Yreka Union, March 6: I learn that Mr. Campbell, our enterprising miner, has a portion of Quartz valley bonded, and is getting up an enterprise to open up that valley and all the tributaries along the western slope of the Oro Fino mountain. The proposed sluice will be some three miles in length, and will open up one of the most extensive and valuable mines in Northern California.

Trinity.

ANOTHER GOOD CLEANUP.—Trinity Journal, March 8: Moor & Day were in town this week with a fine lot of bullion from the East Fork Quartz Mine. Seventeen tons and a few hundred pounds were run through the arastra and produced something over \$2,000, of which amount 102 ounces of the bullion was shipped to San Francisco. Mr. J. L. Day informs us that of the 17 tons run in the arastra, probably one-third was earth and he is well satisfied that the actual rock crushed went from \$150 upward to the ton. East fork quartz has been proven rich, and that section will soon develop into a rich and lively district as much prospecting will be done during the spring and summer, and many new ledges be opened up.

SOLD OUT.—We learn from Mr. C. Frick, of Lewiston, that Mr. Isola has sold his interest in the quartz mine he recently discovered in Deadwood district to an Italian gentleman from San Francisco, for \$9,500, receiving \$1,000 cash down and the balance to be paid when taken from the mine. The new owner is now engaged in running a tunnel and expects to strike the lode in about 20 ft more. If found as good as on top, it will be one of the largest and richest mines in the country.

DEADWOOD DISTRICT.—Cor. Trinity Journal, March 8: I first visited the Black Bear Mine owned by Messrs. Gibson and find a 1000 ft tunnel run on the vein in the center of which a shaft is sunk to the depth of about 70 ft, making the total depth from the surface on the vein a little less than 400 ft. It is astonishing to think of the amount of bullion this little mine has turned out since its discovery. Richard Killin, the discoverer, first sold the prospect to Frick & Davis, who, having made developments and realizing a very handsome dividend, sold the property to Gibson Bros., who are at present pushing it ahead with prospects as good as ever. McDonald Bros. have a splendid mine, the ledge varying from one to two ft in width, and the rock calculated to go over \$100 per ton. They intend crushing part of their rock in the new arastra recently put up by John Gibson. Frick & Davis have started up again after a short sleep through the holidays. They are getting rich rock as such has been the case ever since its discovery. Their new arastra is completed and in operation. Grayson & Lambeth, I believe, still continue, as the old stamps make the usual noise and the whistle whistles its daily tune. William Lappin, "Deadwood's favorite," has a three-foot ledge of good paying ore. James Kelly has shut down on his mine for the present, having out sufficient rock for the season.

"Volunteer."

GOLD IN THE STREETS.—Union Democrat, March 8: Charley Lang picked up a chispa weighing eleven dollars on the street Wednesday, and a young man picked up another, containing two or three dollars,

in front of Jake Binder's Thursday. Can it be said that our mines are exhausted when gold can be picked up in the streets? The work of erecting the roller crushing mill at the Pampa Hill mine, near Rawhide, is rapidly progressing. The mill will be ready for operation in a week or so. There is about a hundred tons of very fine quartz on the dump at the mine.

NEVADA.

Washoe District.

GOULD AND CURRY.—Enterprise, March 8: They put in the "station set," and have since sunk five or six ft below the 2700 level. They will sink about 15 or 20 ft below this level before opening the 2700 station, as a drift will not be started until there is sump room, and until a donkey pump is in place at the station. They will be ready some time next week to begin excavating the 2700 station. At the Bonner shaft the north drift on the 1200 level has been cleaned out and repaired a distance of 130 ft. The drift was found to be caved full, and the work of cleaning out and retimbering has been slow.

SIERRA NEVADA.—The joint Mexican and Union Con. airway on the 2900 level has been completed, and is found to work exceedingly well. It completely changes the course of the heated air that ascends from the 3100 level. Doors are now being put in to regulate the circulation of the cold air from above in the Sierra Nevada ground on the 2900 level.

SAVAGE.—The north drift on the 2600 level is out 85 ft north of the north line of the Hale and Norcross. Yesterday morning a blast in the face of the drift let in about 25 inches of water, and work at that point has been temporarily suspended. Yesterday afternoon the flow appeared to be slackening off somewhat. This water flows out through the 2600 level to the Combination shaft, and kept the pumps very busy all day yesterday.

MEXICAN.—The airway on the 2900 level, joint with Sierra Nevada and Union Con. is completed, and works well. It completely changes the course of the heated air ascending from the 3100 level.

UNION CON.—On the 2900 level the airway joint with Sierra Nevada and Mexican is completed, and is found to do excellent work, completely changing the course of the current of heated air coming up from the 3100 level. On the 3100 level the diamond drill is still at work from the face of No. 1 crosscut, and is showing a decrease of water. No. 2 crosscut on this level shows some water.

HALE AND NORCROSS.—Good progress is making in the southeast drift on the 2800 level. It was yesterday out 70 ft. It is cutting alternate streaks of porphyry and clay slips. There is no trouble in the drift on account of water. The water from the Savage, yesterday morning, was turned aside by a small dam and made to flow through the main cast drift on the 2600 to the Combination shaft.

YELLOW JACKET.—A full force of men is now at work in the mine, and the mills on the Carson river are running to their full capacity. A great amount of ore has been opened up, and there are likely to be no more stoppages for some months. Greater care is now being exercised in the assorting of ore, and only experienced men are allowed to do that work.

BELCHER.—A full force of men is employed in the mine, and all the ore that the mills on the Carson river are able to reduce is being taken out. A large amount of ore has been opened up in the mine at several points by exploring drifts and crosscuts; also, a good deal of material that will pay is being found in the old fillings.

CROWN POINT.—Are again at work with a full force of miners. There is now an abundance of water in the Carson river, and the mills will be able to run steadily for some months—until the water falls next fall.

CALIFORNIA.—The work of enlarging the station at the 2700 level, for the purpose of putting in a double hoisting engine, is fast approaching completion.

COMBINATION SHAFT.—The shaft is several ft below the 280 level. Delay was occasioned yesterday on account of the water coming in from the Savage, but it was expected that the men would be able to again get to work in the bottom of the shaft last night or early this morning.

ALTA.—Good progress continues to be made in the main east drift on the 2150 level; as also is the west drift on the same level. All the pumping and other machinery is working well and smoothly.

CON. VIRGINIA.—Good progress is making in the work of enlarging the station at the 2700 level, at which point a double hoisting engine will be set up.

SUTRO TUNNEL.—Following is the report of progress and details of work in the Sutro tunnel from February 22 to March 8: Main tunnel—Since last report the repairmen have been employed on repairs at the following points: Between 14,400 and 14,500 have taken out nine posts and five caps of old timbers, squared round, removed loose rock and placed in position 11 posts and five caps of new timber. Between 14,000 and 14,100 have removed three posts and one cap of old timber, and put up nine posts and three cap of old timber, also, lagged and blocked new sets where required. Between the 14,700 and 15,300 made repairs to track. Between 15,300 and 15,400 lagged behind old sets. Between 16,200 and 16,300 cleaned up debris, lagged behind sets, and put up one post and one cap. At point 200 lagged behind old sets and put up one new cap. Between point 14,400 and 14,600 placed 125 new covers on drain boxes, and west of 15,000 189 new covers. North Lateral—Since last report the sub-drain has been excavated a distance of 120 ft, and six boxes, each 20 ft long, placed therein, also, 120 ft of track relaid with new rails. North of C and C. connection 200 ft of trestle's supporting drain boxes have been repaired, and some new ones made and put up.

Bernice District.

G. W. Bothwell and family came in Saturday from Bernice on Davis' fast freight line, bringing three bars of bullion valued at \$5,000. Mr. Bothwell says the mill has been put in first-class order, and with plenty of ore on hand the shipments will be more regular in future.

Bristol District.

IN CAMP.—Pioche Record, March 8: Quite a number of Italian coalburners and woodchoppers

are in camp, that are anxiously awaiting the disappearance of the snow from off the hills, so that they can go to work at their several vocations. Foreman Richard Walsli had an extension of 12 ft put on the smokestack of the furnace on Wednesday. This is supposed to draw to a certain extent the dense fumes from around the feed holes.

Belmont District.

BELMONT.—*Courier*, March 8: We are running on foot wall of south ledge on 200-foot level. Have not taken out any of the ledge this week, but making good progress with the drift. Stopes producing the usual amount of good average milling ore.

Columbus District.

MOUNT DIABLO.—*Candelaria True Fixture*, March 8: During the week winze No. 5 has been sunk to 10 ft; its total depth is 87 ft. Winze No. 6 has been sunk 15 ft, making a total depth of 61 ft. The south crosscut, from the shaft on the third level, has reached a length of 380 ft without finding anything of value. There is a small streak of very low grade ore near the face of the crosscut. Work has been stopped here for the present and the men put to work sinking the incline. The south crosscut from the east drift on the second level is in 40 ft, and shows a small spot of ore.

SILVER KEY.—This is the name of a claim owned by Johnny Leidy and situated about two and one-half miles east of the Mount Diablo mine, on the eastern end of the chloride belt. It was originally located by him and has been developed by a tunnel, which has been run a distance of 40 ft. At this point the ledge was cut, and shows a width of from 12 to 14 inches.

COLUMBUS CON.—The usual amount of work is being done on the third level. The west drift from main drift on the third level has been extended to 10 ft, with no material change in the character of the rock.

Eureka District.

A SPRING BOOM.—*Eureka Sentinel*, March 6: There are so many small mines in this district where ore is being piled up which cannot, at present, be sent to the furnaces, on account of the continued snow-blockade; that when the roads and trails are opened, the furnaces now running will be taxed beyond their full capacity; and as the ore reserves at the Eureka Con. and Richmond mines have increased lately, it is probable that additional furnaces will be started up. It is not unlikely that spring will open this year with a boom.

Jefferson District.

CORA D.—*Belmont Courier*, March 8: Since report of February 25th, have made good progress. Tunnel No. 1 is producing the usual amount of high grade ore; will connect with stope incline No. 2 in a few feet. On the 3d instant made a valuable strike between inclines Nos. 1 and 2; the ledge is seven inches thick and stripped for nine ft; shows red chloride, horn silver and free gold, and is very rich. Have broken ground for incline about 200 ft to left of incline No. 1; quartz shows a good ore.

Taylor District.

SHUT DOWN.—*Cor. White Pine News*, March 8: Both the Monitor and Argus mills are closed down, but the managers of both are getting ready to make an early start as soon as the weather will permit. The Monitor people are putting up a whim on their main shaft, which must prove a great saving of labor. Last summer they had to hoist their ore by windlass, and they paid \$4 per day to the men at the crank as well as to all others in their employ. Robert Briggs is superintending at the mines, while Mr. Lyons takes a much-needed rest, having been in harness so long that he deems a vacation necessary for his health.

White Cloud District.

COBALT.—*Silver State*, March 10: George Lovelock, the indefatigable prospector, is developing a cobalt mine at White Cloud district, which contains ore that carry as high as 45 per cent of the metal. Mr. Lovelock was also the discoverer of the Cottonwood nickel mines.

Tuscarora District.

A FINE PROSPECT.—*Times-Review*, March 8: Joseph McGowan has recently struck a fine prospect in the Paymaster claim in a shaft sunk about 750 ft south from the Navajo hoisting works. He struck the ledge about 30 ft from the surface, on which he has run an incline ten ft. At that depth the ledge is fully four ft in width with a vein of milling ore nearly two ft in thickness, which he thinks will average from \$700 to \$800 per ton. Specimens of the ore contain the very unusual variety of native, wire and ruby silver, with free gold, all visible to the naked eye. The ore vein is widened uniformly from the shaft, and if it increases proportionately ten or fifteen ft further, it will develop to the entire width of the ledge. It is certainly a most favorable prospect at present. Mr. McGowan located the ground in 1875, and has done considerable work upon it since that time. He is the sole owner, and if the find develops to the proportions which present appearances indicate, he will reap a rich reward for his perseverance and industry. The ore is mostly green and yellow chloride. Preparations are being made for active prosecution of work in the further development of the property.

THE DIANA.—The Diana Co. has levied an assessment of 10 cents per share. We infer from this action upon the part of the company, that active operations are to be renewed in the mine. It has been a matter of wonderment to the people of Tuscarora why this mine has been permitted to remain idle so long, as the ground is most favorably located, with a strong and well defined ledge and every indication favorable for the early development of a valuable property.

ARIZONA.

LIME AND MARBLE.—*Cor. Phoenix Herald*: A new discovery has recently been made which will be of considerable benefit to this valley. A party consisting of A. B. Wiley and others have located some fine lime ledges, about 30 miles north of Phoenix, which are of extra quality. The rock—or marble which it really is—is found in ledge form, and is carbonate of lime. The ledges are from two to four ft in width, and are very clear and white. There are

many tons in sight, and it is thought by judges who have examined the lime burned from the rock, to be as good as the best California lime. Wood and water are handy, and the owners will begin next week to burn lime for this market. This is a very important enterprise, and will add another industry to Maricopa county, as there will be a great demand for lime in the near future, and we believe this will lead to another round in the ladder, for from these same ledges of marble can be manufactured the very finest of grave stones, and marble slabs for other purposes, for this is a very fine quality of white marble, easily cut, and will polish nicely.

COLORADO.

NOTES.—*Georgetown Courier*, March 6: The Knickerbocker mill at Empire has at last started up. It commenced work last Tuesday, under the management of Messrs. Harrett and Fletcher. The main shaft of the terrible mine is to be sunk 70 ft deeper. The contract has been let and the work begun this week. The shaft is now down over 900 ft. Dennis O'Fallen last week made a good strike in his Royal Oak lode, in Cascade district. He opened up a large body of ore which will no doubt pay him well. Mr. Old informs us, that the heading of his Victoria tunnel, at Brownville, was advanced 50 ft during last month, making the total length of this work on the 1st inst. 425 1/4 ft. A number of mines now lying comparatively idle, will be worked extensively the coming season. The outlook for a prosperous summer is good. We sincerely hope that the "signs of the times" are not deceptive. There was taken from the main shaft of the Mendota mine, in sinking five ft, over 21 tons of ore, net, which returned a value for silver and lead of \$2,076. Eight tons of ore from the second level in the same mine, returned \$589. The total value of last week's ore output from this property was \$2,665. The yield of ore for February was 64 tons 1,086 pounds, the total value of which is \$3,436.14, an average of \$53.71 per ton. Work commenced last week on the Schwartz tunnel, the entrance to which is at Schwartzville, on Chicago creek. This tunnel is now in the mountain a distance of 300 ft, and it is the aim of Mr. Schwartz and sons, who are the owners of the tunnel site, to push the workings through to the ledge on which the Great Republican, Mattie and other locations have been made.

A GOLD BELT.—*Colorado Mining Gazette*, March 5: Up mill creek near Dumont there is a tract which has historic interest for Coloradans. Old kettles, rusted implements of warfare and culinary relics indicate that this place was used as a camping ground by the hardy 50ers followed. Clear creek to Idaho Springs and Central. Trappers and records agree in proving this old time camp to be one of Fremont's outposts two score years ago. So little is this interesting section of Clear creek county known that piles of rocks raised by human hands have never been sufficiently disturbed to discover whether they are the tombs of Indians, or white men. Sanguine prospectors claim that there is running between this point and Empire a gold belt equal in richness to the placer wealth of Corral d'Alene region. The gold producing section extends from the head of Mill creek to upper Empire or beyond, covering a surface of about two and a half miles, in width by six or thereabouts in length. A miner generally reliable and well known states that one dinner bucket containing \$16 and another \$24 worth of gold were panned in a day each, in Clear creek Corral d'Alene. There is likelihood of the existence of a rich gold center somewhere between the fine fissures of Gilpin county and those of Empire.

WHITE PINE.—*Cone*, March 8: A meeting of the managers of the North Star mine was held this week, and it was decided to shut down the mine for a short time on account of the difficulty of keeping the roads open. The suspension will be of short duration, however, as the company has a number of orders in from different smelters which must be filled. Less work has been done in mining in camp this week than at any previous time during the winter. The snow has drifted so heavily of late that all ore teams have been taken off, so that no shipping was done during the week. But a small force has been at work on the Carbonate King, and on Monday the North Star temporarily shut down. Work on the Parole continues, with good results; Porter and Stevenson are working the Evening Star; the Eureka work goes on steadily; Hess and partners are sinking the Sedalia; the owners of the Lela-Etta are doing some good work; the Silver Trowel is being developed; Jack Bailey and partners are crowding the Albany for all it is worth, and some assessment work is being done in various parts of the camp. As a whole, however, this has been one of the duller weeks in the history of White Pine. But look out for a stir when fair weather once smiles upon us.

IDAHO.

WOOD RIVER BULLION.—*Times*, March 5: During the month of February there were received at the Bailey Sampling Works 484,117 pounds of ore. In addition two carloads of Ramshorn bullion were also received and shipped to the Aurora (Ill.) Refinery. But for the heavy storms which blocked up the roads, the shipment would have been double. Still, the above is a very good showing.

MANY MEN.—*Cor. New Northwest*, March 5: George W. Carlton, who returned from the Corral d'Alene mines on Tuesday, says there are about 5,000 men there now, scattered in four or five incipient cities. The average increase is about 100 per day. The distance from Brinkup, Trout and Heron is about the same, 28 or 30 miles—and the population of the first two named is from 400 to 600. Each has plenty of big saloons, burly-houses, etc. Pat. Flynn & Co., and the company working the "Widow's Claim" expect to begin sluicing early in March. They have their drain ditches on, and almost water enough. Bedrock on the "Widow's Claim" is about six ft deep, and lays in waves, the big money being got in the depressions. This is the only claim yet opened. There was five ft of snow at the mines, but it began raining the day Carlton left. But little work can be done before May, and the rush in altogether premature.

EAGLE AND PRITCHARD CREEK.—*Cor. S. F. Bulletin*, March 8: There is no doubt that parties can come by one of the numerous routes at any time, if they are willing to endure the fatigue which thou-

sands have endured. Freight in limited quantities can also be brought in at from 20 to 30 cents per pound. The more important question, however, is when is the best time to come. People who wish to be first in starting any particular business are already too late. There are no lodging houses, and bunks are one dollar each per night. All meals are one dollar each, but the food is wholesome, abundant, and in greater variety than would be expected. Deer are quite numerous in the surrounding mountains, and venison is plentiful at 20 and 25 cents per pound. All provisions are high, but there is a sufficient quantity for all present demands. A man who brought 32 beds and a tent to Spokane Falls found that the freight would be \$1,200 from there to Eagle City. This fact probably accounts for the only hardship people have to endure, namely, the want of a proper place to sleep. Every saloon and store and cabin in the district is thrown open to parties who wish to spread their blankets on the floor, but the floors are usually damp, the space crowded and the nights cold, nor has the thermometer, in the coldest weather, fallen lower than 20 degrees below zero. If men wish to invest in town property, or to start in business, now is the time to come and secure locations and order goods. If a man wishes to invest in mines, he had better stay at home until April or May. Prospecting has been carried on to a very considerable extent, and development is a word which applies to only one or two mines in the district. Eleven claims have lines of sluices, and are said to be down to bed rock. These claims are known as: The Widow, Ives, Hapenstall, Wyant, Macomber, Campbell Points & Co., McQueen Moscow Co., Murray, Rockford Co., and Allman & Co. The gold is very coarse and is usually found in crevices of the bedrock. Nuggets varying in size from one to five dollars are frequently found, and larger and more valuable ones are reported, the largest being valued at \$140. The Widow claim is said to have yielded \$18,000, and others have paid handsome wages. No dependence can be placed on the fabulous statements which make every shovel of earth a shining mass of glistening gold, but enough truth exists in the reports to warrant hundreds of old miners in saying that there are good placer diggings here. Some good quartz ledges have been found, and there is a large number of men scattered all through the mountains searching for others. There is but one claim on which work is now being done, and that is The Widow. Snow lies upon the ground to the depth of four ft at Eagle, and it has until recently been much deeper. In the gulches and on the mountains the snow is quite deep, and prospecting is difficult work. The fact is, however, that there is no need of prospecting, as every foot of ground is located, and in many instances relocated. Parties do not look for diggings, they are only too happy to find unoccupied ground. Some locations, in out of the way places, are being recorded, but it is too late to hope for a claim in the principal mining region. There will doubtless be much contention and bloodshed in the spring, if the mines are as good as represented, for hundreds of cases of "jumping" have occurred. The grand rush which is anticipated in the spring has already commenced, but many who come in now return to their homes until the snow clears away. It takes but a day to walk out to the railroad, and when a man gets broke he has nothing to do but travel. There is little sickness, but many men have colds. There is no destitution, as work is abundant and wages promptly paid. Men of capital and brains are on the ground, and large sums of money are being invested.

COEUR D'ALENE.—*Cor. Ketchum Keystone*: As I have received many letters of inquiry about the Coeur d'Alene mines, and as each letter costs me 50 cents, and as I have \$1 a meal—well, I guess the boys will tumble. Good pay has been found a distance of thirteen miles up and down Pritchard creek, up Bear gulch about eight miles, and up quite a number of side gulches. Some ground has been found that prospects from one cent to nine cents per pan. Wherever bedrock is found it is rich. Many think this will be a rich camp, but I am not excited over the prospects, for I can see many drawbacks to the country's development. In the first place, the country is very flat and the bedrock very deep; this I consider a very great drawback. Again, heavy timber is growing all over the gravel grounds, and in most places there is no pay till bedrock is found. Eagle creek has been located some seven miles from its mouth, but it seems hard to get to the bedrock, and there has been very little done on it, and less profitable work. Beaver creek, about five miles south of Pritchard, is supposed to be good, and one company has taken out some gold this winter. It is hard to say how extensive the country is, but if one claim out of every twenty locations pays, it will be a good country. The number of locations are countless. As far as quartz is concerned, there is not much known. Snow came about the time the quartz prospectors did. I have seen some very good ore. They claim to have some four or five good prospects. Mr. Jake Colaugh, of Ketchum, has invested in some quartz. The Coeur d'Alene will not be as easy to prospect as the Wood River country, for there is too much timber and not enough grass here to make the work easy.

MONTANA.

MARYSVILLE.—*Helena Independent*, March 6: Recently it suited your correspondent to pay the Belmont mine a visit. Here was found Captain J. H. Burns and W. B. Pearson, who have been employed the past winter prospecting this once famous bullion producer. From a conversation with Captain Burns I learned that they had run a crosscut a distance of 105 ft on a level with the lower or No. 1 tunnel, and 575 ft from the mouth of the same. This crosscut is expected to cut the bonanza of rich quartz encountered in the north vein in tunnel No. 1. Three veins have already been cut, each from ten to eighteen inches in width, and prospecting quite well in gold. In the face of this cut there is considerable quartz, which is a fair indication that the ledge is not far off. It is very probable that in a few months more the old Belmont will be pounding away as of yore, and paying her way as she always has done. With the new improvements in saving the precious metals, as demonstrated at Gloster, it will, if adopted at Belmont, make a great difference in the product of the mine.

A LARGE LOAN.—Mr. Thomas Cruse yesterday made a loan of \$150,000 to the Montana Co. Limited, for one year at eight per cent per annum,

taking a mortgage for that amount upon the company property. This is the largest loan ever made by a private individual in the Territory. This money is intended to be used for the exclusive purpose of adding thirty more stamps to the twenty now being put up in the new mill at Marysville, thus giving the company sixty stamps in all. Mr. Cruse, who has undoubted faith in the Drum Lummion mine, volunteered to furnish the money for completing the work, thus enabling the company to retain its stock in the treasury. The offer was accepted by the company, and the money was paid over yesterday through the Merchants' National Bank. It is believed that the lower tunnel will strike the lead within the next two weeks, and if it proves as good as the lead above, which is confidently expected, the stock of the company will be worth a premium of three or four hundred per cent. Such a result will demonstrate the wisdom of borrowing money and retaining the unsold stock in the treasury of the company.

THE DRUM LUMMON.—*Inter-Mountain*, March 8: The ore body of the Drum Lummion has been tapped by the Masklyn tunnel which intersected the ledge at a depth of about 600 ft. The ore, which is reported to assay well, has been penetrated to a depth of three or four ft and the extent of the strike cannot therefore be stated. It is, however, a very important development and sets at rest all doubts as to the permanence of the mine. The ore lies next to a porphyry dyke on the foot wall, in which the tunnel face has been for some time past.

MURRAY DISTRICT.—*Inter-Mountain*, March 8: There is no mining camp in Montana that has a more promising future than Murray district, which is situated about 15 miles south of the Springs. The ore bodies are tapped by a number of farmers of Gallatin valley and business men of Bozeman, who have ample means at their command to develop the district. The copper ore taken from the mines there is said to be the best yet found in Montana, and the deposits are said to be sufficiently great to warrant the erection of a smelter, which it is proposed to put up in the spring. We feel confident that the new camp will become a place of importance in the near future.

NEW MEXICO.

STRIKES AND TRANSFERS.—*Silver City Enterprise*, March 6: A new mining company is organizing for Telegraph district. A new strike has been made in the Viola, at Pyramid. It is said by knowing ones that extensive work will soon be commenced on the Blue Bell mine. With every foot of work accomplished upon the disputed Rose claim at Bullard's Peak, the property shows up to a better advantage. Mullen & Kerr are steadily developing the property. Eight men were put to work on the mining of the Telegraph Mountain and Gila River Mining Co. last week. It is probable that work will soon be commenced on an extensive scale in that district. The promising group of claims purchased by Mr. Schulte, of St. Paul, and others are being opened up systematically. The Pumpkin claim of this group has a fifty-foot shaft, and the Butternut mine has improved with every foot of work done. At a depth of 65 ft, ore of the same character as that of the Black Hawk has been encountered, and the prospect is so promising that a contract has again been let to continue sinking. Upon Mr. Schulte's return from the East, work on an extensive scale will be commenced on this group. Some importance is felt outside this city in the coal strike made near Bullard's Peak. It is rapidly advancing in popular favor, and is generally recognized as a big thing. During the week the mineral expert of the Southern Pacific Railroad, and several other gentlemen of prominence have visited the ground, and agree that it is a most important discovery. It is said that the Southern Pacific Railroad Co. will make the owners a proposition, and if acceptable, will develop the property extensively. The coal is genuine anthracite, and much superior in quality to any yet discovered in the Territory. At present the ledge is fully three feet in width, where on the surface it was but a few inches. Great interest is being taken in the development of this claim.

UTAH.

REVIEW.—*Salt Lake Tribune*, March 7: For the two months of the present year the receipts of bullion (excluding ore) have been as follows: January, \$449,228.74; February, \$361,666.47. During the week ending March 5th inclusive, the receipts of bullion in Salt Lake City were \$111,645.22, and of ore, \$8,880; of both, \$1,020,225.22. The week before, the receipts were \$106,388.05 in bullion, and \$6,000 in ore. The shipments from this city for the week ending Saturday, March 1st, inclusive, were as follows: 19 cars bullion, East, 1,234,625 pounds; 1 car antimony, East, 23,673 pounds; 3 cars white lead, East, 67,345 pounds; 48 cars ore East, 1,020,000 pounds; total 101 cars, 2,345,643 pounds. The shipments of the Horn Silver for the week were eighteen cars of bullion, \$54,000. Total shipments for the year to date, \$375,000. A lively interest is taken in this company, and favorable comments on its annual report are quite common in Eastern journals. The Ontario shipped for the week, 22 bars of bullion, \$35,655.22. Total for the year, \$289,830.09. This mine was never before in so good a condition as now, and its prospects are as bright as its record, which is saying plenty. The Stormont sent up two bars of silver, \$3,820. The product of the Hanauer smelter for the week was eight cars of bullion, \$14,600. The Crescent sold and shipped ore to the amount of \$8,880. It shipments to the Macintosh sampler are reported as follows in the *Record*: February 23d, 103,550 pounds; February 24th 107,640 pounds; February 25th, 112,990 pounds; February 26th, 117,520 pounds; February 27th, 121,260 pounds; February 28th, 124,410 pounds. February 29th, 139,060 pounds; Total \$26,430 pounds. From the same we learn that the Sampson shipped to Macintosh's sampling works during the week 25,740 pounds of first-class ore. Total for the month of February, 64 tons, which netted the company over \$100 per ton. The Sampson mine is constantly improving as depth is attained, and it will in all probability become one of the mainstays of the camp. The shipments of ore alone speak volumes for the property. Already they reach about \$6,000 per month, and are constantly increasing as development progresses.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

[ESTABLISHED, 1869.]

A. LUCKHARDT.

B. SALAZAR.

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

THE ROLLER ORE FEEDER.

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works,
Sole Manufacturers,

CHICAGO FRASER & CHALMERS. ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns.

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars. Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x30. This latter also furnished J. B. Haggin or Olant and Old Abe Co., Black also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. Baby Hoists for Prospecting, 4 H. P. to 6 H. P.

Wire Rope, Safety Cages and any Size and Forms of Cars.

McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail. **HALLIDIE IMPROVED ORE TRAMWAYS.** We refer to Gen. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36, of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

KNIGHT'S WATER WHEEL

For Mills, Pumping and Hoisting

OVER 300 IN USE!

All Estimates Guaranteed.

SEND FOR CIRCULAR.

EDWARD A. RIX,

Sole Agent,

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252 Market St., S. F.]

FOR WEEK ENDING MARCH 4, 1884.
 294,430.—ROCK DRILL—Barlow & Emery, Nevada City, Cal.
 294,361.—CRUSHING ROLL—W. H. H. Bowers, Salt Lake City, U. T.
 294,616.—DEVICE FOR DESTROYING INSECTS—C. J. Gustavson, Salt Lake City, U. T.
 294,737.—APPARATUS FOR REMOVING SAND BARS ETC.—L. A. & N. E. Johnson, Portland, Oregon.
 294,481.—GATE—J. R. Lowe, Anderson, Cal.
 294,649.—GATE—D. B. Matlock, Red Bluff, Cal.
 294,654.—STEAM BOILER FURNACE—L. L. Merrill, S. F.
 294,493.—FENCE POST—E. D. Miner, Dayton, W. T.
 294,505.—BAG HOLDER—A. Robinson, Benicia, Cal.
 294,693.—HAY LOADER—M. M. Sornborger, Millville, Cal.
 10,973.—TRADE MARK—Bothin Manufacturing Co., S. F.
 10,974.—TRADE MARK—California Fig Syrup Co., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

GATE.—John R. Lowe, Anderson, Shasta Co., Cal. No. 294,481. Dated March 4, 1884. This invention relates to certain improvements in field gates and the means for holding them open while being passed. It consists in a combination of devices. It is certain in operation, not liable to derangement, and springs may be dispensed with.

ROCK DRILL.—Charles O. Barlow and George T. Emery, S. F., assignors of part interest to Joseph W. Sprague, Nevada City. No. 294,430. Dated March 4, 1884. This rock drill consists in a body bar carrying the power mechanism, the drill, the hammer, and the means for operating said hammer and rotating the drill, said bar being suspended from and adapted to slide upon a cross-bar which is attached to a supporting column in such a manner as to have a vertical, horizontal and inclined adjustment. The drill may be run by a "hurdy-gurdy" water wheel or an engine.

A BAD FALL.—John Watson, the engineer of the California Sugar Refinery, met with a very bad accident this week. While the steamer *Alameda* was discharging at the refinery he was precipitated into the hold, a distance of 50 feet. He was picked up in an insensible condition, when it was ascertained that he had three ribs broken, and also suffered other internal injuries. He was conveyed to his residence, on Ninth street, in a very precarious condition.

FRITCHARD, who spent so much time and labor and underwent so many hardships in bringing the *Coeur d'Alene* mines into prominence, is meeting with that ingratitude which is always the portion of great discoverers. He has been robbed of his property in the new mining district, and now all that he has left for all his years of toil is one very ordinary (in value) placer claim, everything else having been gobbled by the insatiable jumpers.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

MINING SALE.—Archie Farington, the well-known mine owner of Garfield, has bought the Lee & Lacy mine, about nine miles from Soda Springs. It is said that he paid \$10,000 for it. It is expected that work will be commenced at once. This is one of the best developed and most promising mines in Esmeralda county.—*Walker Lake Bulletin*.

The 10 prospectors supposed to have perished in the *Coeur d'Alene* mountains have arrived at Trout Creek station.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNAL

Mining Share Market.

Fluctuations in prices have been more apparent during the past week than has been the case of late. The market has not been quite so dead. At the Gold Hill mines all is going on well since the starting up of the mills on the Carson river.

The airway on the 2900 level, jointly run by the Sierra Nevada, Mexican and Union Con., has been completed, and operates splendidly, carrying away the current of heated air that comes up from the 3100 level. On the 3100 level the diamond drill is still being run from the face of No. 1 crosscut in Union Con.

In the Sierra Nevada the northeast drift is still in vein material. It is not expected that much change will be seen until crosscutting is begun. Doors are being put in on the 2900 level for the regulation of the ventilation in the northern part of the mine.

Bullion Shipments.

Hanauer, March 5, \$1,680; Crescent, 5, \$2,550; Horn Silver, 5, \$9,000; Ontario, 5, \$4,466; Stormont, 6, \$3,820; Hanauer, 6, \$2,100; Horn Silver, 6, \$9,000; Ontario, 6, \$4,640; Hanauer, 7, \$4,100; Horn Silver, 7, \$6,000; Ontario, 7, \$4,863; Moulton (for January), \$65,000; Crescent, 8, \$3,350; Hanauer, 8, \$1,950; Horn Silver, 8, \$3,000; Ontario, 8, \$4,895; Hanauer, 9, \$2,030; Horn Silver, 9, \$6,000; Ontario, 9, \$4,687; Horn Silver, 11, \$15,000; Ontario, 11, \$9,880; Lexington (for February) \$90,000; Bodie (for February), \$103,000. The banks of Salt Lake City report the receipt for the week ending March 5th, inclusive, of \$111,645 22 in bullion, and \$8,880 of ore; of both, \$120,525 22.

MACBETH'S —PATENT— STEEL PULLEY.

Advantages of these Pulleys.
They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.
They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.
On account of their great lightness and the form of the arms, they absorb less power than any other pulley.
They are the only pulley of the kind which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited),
LEIGH, ENGLAND, Nov. 5, 1883.
N. Macbeth, Esq., Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.
They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.
Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

GIANT POWDER

MANUFACTURED UNDER ALFRED NOBLE'S Original and only valid Patents for NITRO-GLYCERINE Powders, which has been and still is of such immense advantages to the Miner, Railroad Man and the Engineer. All other Nitro-Glycerine Compounds are simply imitations and adulterations of the Original Giant Powder. The GIANT POWDER COMPANY manufacture three grades of Powder, which are the Safest and Strongest High Explosives in the market. The Original Nitro-Glycerine Compound, GIANT POWDER or DYNAMITE, is acknowledged by all the great chemists of the world as unapproached by any other compound. The GIANT POWDER COMPANY have acquired the exclusive right to manufacture "NOBLE'S EXPLOSIVE GELATINE," which contains 96 per cent. of Nitro-Glycerine. It is still stronger than Dynamite, and even safer in handling. This explosive was used in constructing the Mont Vent Tunnel. THE JUDSON POWDER is a black Powder owned and manufactured by the GIANT POWDER COMPANY; is from three to five times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it Breaks More Ground, Pulverizes Better, and Saves Time and Money. The only difficulty heretofore experienced by some consumers of this Powder has been that it required more time to get it to the bottom of a deep borehole. This has now been entirely overcome, and our JUDSON IMPROVED is now as dry as the ordinary Blasting Powder and runs as freely.

New Book on Assaying Gold & Silver Ores.

By C. H. AARON.

For Practical Workers—\$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scoriafication; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth, 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 232 Market street, San Francisco.

N. B.—This is Part I of three volumes on assaying by the same author. To be followed by Part II—Gold and Silver; Part III—Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS, S. F.

HEINE PATENT SAFETY BOILER.

RISDON IRON AND LOCOMOTIVE WORKS,

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

Economy in space and fuel. Safety at high
pressures. Freedom from scaling. Equally
adapted for power and heating purposes.
Especially adapted for mills, factories, hotels,
stores or any place where safety is a necessity.
Will work well with muddy water and any kind
of fuel.

TESTIMONIALS.

St. Louis, Mo., Sept. 23, 1883:

Messrs. Adolphus Meier & Co. - GENTLEMEN:
We cheerfully certify that the "Heine Patent
Safety Boiler" put up by you in our establish-
ment has proved very satisfactory in its working.
The chief points of excellence in the "Heine
Safety Boiler" are its economy in fuel and space,
freedom from scaling, aptitude for power and
heating purposes, working equally well with clear
and muddy water. We warmly recommend it to
all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASSN.

OFFICE OF SUP'T OF ROYAL RAILWAYS,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to
your inquiry of September 2d, we respectfully in-
form you that the three boilers built under your
patents, under steam since September 25, 1881, at the Alex-
ander Platz Depot, as well as the two at Friedrich Strasse
Depot, under steam since September 22, 1882, have given
good satisfaction, requiring no repairs whatsoever to date.
The internal cleaning of the boiler was always accomplished

with ease on account of the convenient arrangement of the
tube caps, the adhesion of scales being fully prevented
thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

The PACIFIC WATER JACKET SMELTERS embrace
many features that are entirely new and of great practical
utility, which are covered by letters patent.

No other furnaces can compare with these for dura-
bility and in capacity for uninterrupted work.

MORE THAN ONE HUNDRED of them are now runs
along on the Pacific Coast, giving results never before
obtained as regards continuous running, economy of
fuel, grade and quality of bullion produced. We are
prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requir-
ing no brick or stone work, except that for the crucible,
thus saving great expense and loss of time in construc-
tion.

Complete smelting plants made to order of any capacity
and with all the improvements that experience has sug-
gested as valuable in this class of machinery. Skilled and
experienced smelters furnished when desired to super-
intend construction and running of furnaces. Estimates
given upon application. Send for circular.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, MARCH 22, 1884.

VOLUME XLVIII
Number 12.

An Improved Ash-Hoist for Steamships.

On the steamers *Alameda* and *Mariposa* which run between this port and Honolulu, on the Oceanic Steamship Company's line, an improved device has been adopted for raising the

ashes from the fire room and passing them overboard, without any handling at all. The device was invented and patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Mr. John D. Spreckels, one of the principal owners in the line and the senior of the firm acting as agents. The engraving on this page shows the general idea of the apparatus, which, though simple as it may appear, is a very great addition to the convenience and comfort of passengers, as well as labor-saving to the firemen and coal passers.

Ordinarily ashes are hoisted by iron chains and buckets and dumped into a chute, a process accompanied by a considerable manual labor and a good deal of noise. On a big ocean steamer, burning from 100 to 200 tons of coal a day, this ash-hoisting goes on periodically, the clanking of the chain and bang of buckets being one of the annoying features of ocean travel. In the improved apparatus invented by Mr. J. D. Spreckels, all this is done away with the operation being conducted noiselessly.

On the hearth of the fire-room is an iron receiver into which the ashes are dumped. The refuse from the fire room at the opposite end of the boilers is brought in iron buckets, such as are used for passing coal, and which are suspended by chains from rollers which run on rails above, as the engraving shows. The ashes are dumped on the iron floor and wet down so as to cool them and prevent them from injuring the elevator belt, after which they are raked into the receiver whenever they accumulate so as to be inconvenient.

The receiver is so arranged that the tension of the belt is adjustable. As the belt revolves, the

buckets scoop up the ashes deposited in the receiver, carrying them to the upper deck, where they fall into a chute-pipe leading downwards to the water-line of the vessel. The power to operate the belt is a small engine on the side of the casing, which receives its steam from the

extends down through the second deck in a nearly vertical position, and below the deck it curves outward so as to assume a more nearly horizontal position and pass out through the side of the vessel, thus obstructing the interior space to the least extent. As the material

A gate is fitted into the discharge chute, near its outer end, and serves to close it when not in use, preventing ingress of water. This valve or gate swings in a chamber of somewhat larger diameter than the rest of the pipe, so that when it is open it is out of the way and leaves a clear

passage. Its shaft has a lever arm with a connecting rod and hand lever, by which it may be opened and closed, and a curved link or rack with a set screw or pawl to hold it open or closed at will. The way this is operated is shown in the engraving. When the little engine is started the discharge valve is opened and a stream of water turned into said discharge pipe. As the ashes are hoisted and dumped into the discharge chute they are quickly forced overboard, the whole operation being performed quickly and without noise. The apparatus is also utilized for another purpose. At a point above the deck, where the donkey boiler is placed, a door is made, and a plate is fitted into the chute so that when in place it extends upward and backward from the lower edge of the door-opening as an incline. This device is used when ever it is desired to hoist coal from the fire-room bunkers for the use of the donkey boiler, and the coal, being taken from the receiver, is

carried up by the buckets and discharged into the chute, flowing down the inclined plate referred to, which directs it outward through the door opening on to the deck. When ashes are to be removed the plate is taken out and the door closed.

The device has been found to work very well indeed in practice, saving a great deal of labor and

doing away with dust and noise. The writer has examined it on board of the steamers, and those in charge speak very highly of its efficiency. No ashes dirty up the decks or fly in the eyes of passengers, and no men have to stand on deck to dump buckets into the chutes. The discharge is under the water line, as shown, so no dust is created.

SPRECKEL'S IMPROVED ASH HOISTING AND DISCHARGING APPARATUS FOR STEAMSHIPS.

main boilers of the steamer. The gear wheel for revolving the belt-drum is shown in the engraving, as is also the small engine.

The upper end of the discharge chute or pipe has a hood extending upward, and curving partially over the upper bucket roller, so as to insure the discharge of the contents of the buckets into the chute without scattering. The chute

is apt to clog when discharged through this chute, an opening or passage is made into it, entering on a line with the direction of the lower portion, and a water pipe, as shown, connects with it with a valve, through which a body of water from the pump may be discharged through the pipe, and forcibly clear it or prevent any lodgment of material within it.

Examinations of Fertilizing Materials.

University Experiment Station—Bulletin No. 8.

1. *Analysis of the Ash of Spent Tan-bark.*—This material is sometimes obtainable in considerable quantities from neighboring tan-yards; and the sample was furnished by Mr. John H. Wheeler, Secretary of the Board of Viticultural Commissioners, with a view to ascertaining its manurial value and especially its adaptation as a fertilizer for vines.

The ash contained some unburnt matter which was not determined directly. In the table below, column 1 shows the composition of the material after drying at the boiling point of water; column 2 shows the composition as it would be if burnt completely and at a higher heat, so as to "burn" the lime into quicklime:

	Per Cent.	Per Cent.
Insoluble residue.....	5.68	8.87
Potash.....	2.90	4.53
Soda.....	3.36	5.25
Lime.....	41.40	64.69
Magnesia.....	5.02	7.55
Iron and alumina.....	4.67	7.40
Br. ox. manganese.....	1.67	2.48
Sulphuric acid.....	.26	.40
Phosphoric acid.....	.47	.73
Carbonic acid.....	27.67
Organic matter and loss.....	8.26
Total.....	100.00	100.00

It will be noted in column 1 that lime (in the form in which it exists in air-slaked lime, in combination with carbonic acid and water) constitutes the bulk of this ash, while the ingredients of chief importance as mineral plant food, viz.: potash and phosphoric acid, are present in small amounts only as compared with the ash of oak wood, or of fresh bark. This change is partly the result of the leaching the bark has undergone in the tan-pits, partly that of the use of lime in dressing the hides. Assigning to the 58.0 pounds potash and 9.4 pounds of phosphoric acid contained in a ton of the raw ash, the valuation usually made in the case of commercial fertilizers, it would be worth about \$6.36 per ton on that score; but where lime is needed it might be valued from eight to ten dollars for actual use. Potash is especially needful for the maintenance of production in older vineyards, but as a rule it is abundant in fresh soils in California; while phosphoric acid is, on the whole, but in small supply.

2. *Analysis of the Lime Refuse from the Alcarado Sugar Works.*—This is the by-product of the defecation of the beet juice with lime, and, of course, it consists in the main of lime in the air, and water-slaked condition. The object of the analysis made at the suggestion of Mr. John L. Beard, of Centerville, was to ascertain the amounts of phosphoric acid and ammonia, or other nitrogen compounds that have been taken up from the beet juice and would be in a highly available condition as fertilizers. The substance is a grayish paste, of an offensive odor, in which the presence of ammonia is, however, easily perceived. Hence it is obviously losing in manurial value continually, as it lies exposed to the air. In drying it for analysis, this loss, of course, was also increased. The determination gave:

	Per Cent.
Phosphoric acid in air-dried mass.....	1.57
Ammonia (determined as nitrogen).....	.67

From the condition of the mass when received, it may be inferred that quite one-half, if not more, of the nitrogen originally contained in the fresh mass had already evaporated in the shape of ammonia gas.

Considering that the two ingredients thus derived from the beet juice are present in a highly effective condition, it is certainly worth the while of those living near the factory to haul this refuse upon their fields, or to use it in composting, especially with the tule muck, or marsh soil, which will thus be sweetened by the lime, and will serve to retain the ammonia. The latter object may also be attained by using some plaster in the compost. Aside from the lime, the value of the dry material, as shown in the analysis, is about eight dollars per ton, according to the usual schedule.

Examinations of Soils.

Granite Soil from the Foothills of the Sierra Madre, Los Angeles County.—Sent by Mr. Wm. A. Spaulding, of Sierra Madre, who says that such land forms a kind of sloping mesa, "the natural growth being greasewood, white sage, sumac, lupins, etc., with an occasional sycamore. The brush is naturally heavy, and often swept by fires. The soil is easily cultivated, and does not differ obviously from the subsoil; drinks up all the water that can be put upon it, but retains moisture well during the hot summer. Deciduous trees and grape vines flourish without any irrigation, provided they are fairly cultivated; citrus trees do finely, but it is not well suited to grasses, clovers, corn, grain, root crops or garden vegetables." It is especially desired to know the cause of the latter defect and its possible remedy.

This soil is rather coarsely granular or sandy, the grains being obviously largely granite debris. This fact renders a full analysis unnecessary, since such soils are known to contain abundance of potash and, in California, of lime. A special determination proved that it also contains an adequate supply of phosphoric acid. It is therefore obvious that its defect is a mechanical one, and this was verified by me-

chanical analysis, the soil being passed successively through sieves of increasing fineness, upon which there remained the following percentages of sand too coarse to pass:

	Per Cent.
Sieve with meshes of 1-12th inch retained.....	30.4
Sieve with meshes of 1-25th inch retained.....	20.6
Sieve with meshes of 1-50th inch retained.....	17.0
Sieve with meshes of 1-60th inch retained.....	12.3
Finer than 1-60th inch, or "fine earth".....	19.7
Total.....	100.0

This fine earth was found to contain 4.7 per cent of true clay, which referred to the entire soil, shows the latter to contain only about nine tenths per cent of clay.

This fact explains fully why the shallow-rooted grasses, vegetables, etc., will not grow well on this soil. The surface soil, upon which they mainly depend for their nourishment, is too coarse to afford it, contains too little fine matter from which their roots can draw sustenance, and is also too open to the dry summer atmosphere. The fine matters are constantly carried by the rain or irrigation water to greater depths, where the roots of trees, vines and tap-rooted plants can follow them, and find moisture at the same time.

It is not easy to suggest a remedy for this state of things that would be applicable on the large scale. For small garden plots, flower-beds, etc., the hauling of a more clayey soil on the surface may be feasible. Another expedient is the one employed by the Arabs, viz.: to plant in pits so as to bring the shallow roots within reach of a more compact soil and abundant moisture. But for practical purposes, the culture naturally adapted to these circumstances will have to prevail.

Soil from Capay Valley.—Sent by Mr. E. W. Thomas of Capay. This soil is evidently old alluvium of Cache Creek, substantial but light and somewhat gravelly, with a gravelly subsoil. Mr. Thomas desired to have some definite data as to its adaptation to fruit culture, and prospective durability. The only points needing determination in this case were the amounts of lime and phosphoric acid present, which were found to be as follows.

	Per Cent.
Lime.....	.735
Phosphoric acid.....	.164

As the rocks of the valley are known to contain abundance of potash, and the above percentages are quite satisfactory, there can be no doubt of the adaptation of the soils to the purpose intended, nor of fair durability.

Berkeley, March 6, 1884. E. W. HILGARD.

EUREKA MINERS' UNION.—The Miners' Union of Eureka went to the Home Ticket mine and requested all the non-union men to quit work. These men, who were working on tribute, came up from underground and quit work. The *Sentinel's* reporter, later on in the afternoon, called at the Ruby-Dunderberg office on South Main street, where he met Mr. Rickard, Mr. Kermeen and Mr. Wilson, respectively President, Superintendent and Secretary of the Home Ticket Company. Mr. Rickard, in response to the reporter's inquiry as to the facts of the case, said there had been no "trouble." He said that Mr. Kermeen and he were at the mine, towards noon, when the members of the Miners' Union came to the works. The officers of the Union came to him and told him their mission as stated above; and said that the Home Ticket men had promised to come over and join the society last Friday night. He says he told them that he had no objection to his men joining the Union, but he told them that if they shut down the mine and kept it idle till Friday night such detention would involve a loss to his company, and he would hold them responsible for the damages incurred. He was willing, however, in order to give his men a chance to go over to Ruby Hill and join the Union, that the mine should be shut down for one day, yes, today. Mr. Rickard said he had some further discussion with the officers of the Union in regard to the workings of their organization, which, perhaps, it would be of no advantage to publish. Mr. Rickard says that the men in the Home Ticket mine were to have become members of the Union at its last meeting, Friday evening, but they say the snow was so deep and the weather was so bad that they could not well walk over to the place of meeting. This is about the whole story as to the facts of the case. As we understand the matter, the sixteen Italians working on contract in the Home Ticket mine were to join the Miners' Union yesterday afternoon—which would remove all cause of disagreement or controversy so far as this particular case is concerned.

TUNNEL MINING ENTERPRISE.—The tunnel mining enterprise at Hoyt's old crossing on the South Yuba is now in full operation. About half of the water that comes down the channel (between 160,000 and 200,000 inches in all yesterday) passes through the tunnel and carries over the sluices an immense amount of debris all of which is supposed to contain more or less gold that will be caught and retained in the quicksilver.—*Nevada Transcript.*

MINERS going to the Coeur d'Alenes are giving Belknap the go-by and saving money and time. The road from that point to Eagle City is impassable because it is not yet finished, and a few days of warm weather will render it necessary to put on a line of mud scows across the bog between Belknap and the mountains.—*Butte Leader-Mountain*

Coeur d'Alene Mining Laws.

Following is a copy of the by-laws adopted by the first miners locating in the new regions: Local laws of the Coeur d'Alene mining district located on Pritchard and Eagle creeks, Shoshone county, Idaho Territory:

By-Laws:

SEC. 1. All locations on lodes of veins of quartz to conform with the United States laws of May 10, 1872, as nearly as practicable, viz.: Fifteen hundred feet (1500) in length, by six hundred feet in width.

SEC. 2. Placer mining claimants shall be allowed twenty acres, to be located so that the length shall not exceed eighty rods.

SEC. 3. Each location shall be represented by the locator or his authorized agent in locating and recording.

SEC. 4. No person shall be restricted to one claim, but may locate one claim in any stream or gulch where vacant ground may be found. But no person shall be allowed to locate more than one claim on the same stream or gulch. Persons shall not be prohibited from holding claims acquired by purchase.

SEC. 5. Claimants shall have one year from the first of January succeeding the date of location to work their first annual assessment which shall be one hundred dollars. Each year thereafter claims shall be represented by twenty dollars worth of labor each month after the first of June until the first of November after the first year's assessment. Furthermore, all claims shall be considered laid over from the first of November to the first of June. All necessary work, such as making roads or trails, building houses, or any improvements in opening or working a claim, will be allowed five dollars per day as assessment labor.

SEC. 6. Claimants will be required to record their claims in the district record within fifteen days from the date of location.

SEC. 7. The oldest or first claimants shall have the first privilege of water, but shall not prohibit others from using the surplus water, and all claimants shall be required to return the water to the channel of the stream for the benefit of those below.

SEC. 8. Several miners may form a company for the purpose of opening and working mines in placer claims, when such claims are contiguous, and the labor performed by said company shall represent their several claims, although the amount of labor for the convenience of opening and working may be done on one claim.

SEC. 9. Difficulties arising between parties in the mining district shall be settled by arbitration, each disputant to be allowed an equal number of arbitrators, and in case of a tie on decision said arbitrators will have power to call an assistant.

SEC. 10. All claims located prior to the date of the adoption of these by-laws shall be respected just the same as those made after said date.

SEC. 11. The records of the Coeur d'Alene Mining District, in Shoshone county, Idaho Territory, shall be kept at the house of A. J. Pritchard, Recorder, near the confluence of the Eagle and Pritchard creeks.

SEC. 12. On the written application of 12 or more miners, the Chairman shall cause three notices to be posted up in three conspicuous places, giving ten days' notice of a meeting, said notices to specify the object and business to be transacted at such meeting. To make any changes in the present by-laws between the 1st of November and the 1st of June the following year shall be illegal.

SEC. 13. These laws shall take effect from this date, and any laws or regulations previously enacted that conflict with these laws shall be considered repealed.

Routes of Travel to Coeur d'Alene.

C. F. McGlashen writes to the *San Francisco Bulletin* as follows:

Freight has generally been brought to this region over the Evolution trail, via Mission City and Fort Coeur d'Alene, from Spokane Falls and Rathdrum, the entire distance being about one hundred miles. Sleighs carry freight to Evolution, and pack trains convey it thence to Eagle City. The trail has usually been kept open, no blockades having lasted longer than a few days at a time. A weekly mail is carried by two brothers over this route, each letter costing fifty cents to the party who receives it. At one time the mail carrier's feet were frozen so badly that he was compelled to stop work for five weeks. Every man on the trail, that trip, had either feet, hands or ears frozen. The Heron Siding trail was used somewhat by footmen coming to the mines, but upon the opening of the Trout Creek trail, about the middle of January, nearly all the travel changed to this route. Seven men have just come in from Heron's Siding who were seventeen days on the road. They were caught in storms, and suffered considerably from lack of food and exposure. The Trout Creek trail, however, has been constantly kept open by the great number of men who travel it each day. Freight in considerable quantities is brought over this route in hand-sleds and toboggans drawn by men. A toboggan is a board five or six feet long, with the forward end curved like a sled runner. From 125 to 200 pounds are drawn on a toboggan by one man. The trail is very difficult, running along hillsides and over lofty mountains, yet a hundred toboggans and twice as many men are traveling it daily. Men have

walked the distance from Trout Creek to Eagle City, thirty-five miles, in less than eleven hours, but ordinarily it takes two days. Stations are situated every few miles, where food and shelter can be obtained. A toll of fifty cents is collected from each man traveling the route. A trail and wagon road are projected from Belknap, and the Northern Pacific are booming this route. It is not yet open for travel, however, and the universally popular road is a rival to that from Belknap, leaving the railroad a few miles further east, at Thompson's Creek. A large force of workmen are pushing a good road into the mines from Thompson's, and have about eighteen of the thirty-five miles completed. It is generally conceded that unless had weather prevents this road will be completed by the 10th of March, and will be the road over which the great bulk of freight and travel will come. All depends, however, on the weather. The North Fork trail reaches Eagle from Spokane and Rathdrum. It is not much traveled at present because of the thirty or more crossings of the river which have to be made. As soon as high water comes in the Spring this route is destined to be very popular, because steamboats can run from Fort Coeur d'Alene on Lake Coeur d'Alene, and up the River Coeur d'Alene to within five miles of Eagle City. The Fort is only eleven miles from Rathdrum, on the Northern Pacific, and a branch road has been projected connecting these points. Two steamers have been completed for travel on the lake, and the Government steamer at the Fort will also be used in transporting freight and passengers. Tickets from Portland to Eagle City are offered for sale on and after March 16th. Large numbers of men are engaged in opening a road from Rathdrum, another force has been sent from Spokane Falls to bring a road from Jackass Prairie, and a third will soon be at work cutting away a large drift in the North Fork so that boats can ascend.

The Mining Town of Anaconda.

The *Inter-Mountain* says: During the coming season of activity Anaconda will be the liveliest town in the Territory. At least 1,200 men will be given employment there, and the disbursements for wages will be larger than in any other burg in Montana, butte alone excepted. It has been reported in some journals that Anaconda has experienced a season of depressing dullness since the temporary suspension of operations by the company a few months ago, but the fact is that the town has been lively all winter, and that every business house there has made money. Last month the sum of \$40,000 was paid out for wages and supplies, and this month the disbursements will be greatly increased. From now on, it is stated to be the intention of the company to increase the working force as fast as men can be profitably employed, the intention being to have the concentrator and smelter in active operation before the snow flies next fall. The cost of the works complete will not fall far short of \$1,000,000. Their capacity will be the largest of any reduction works of the kind in the world.

The town of Anaconda is a wonder. Located near the mouth of a canyon, and on a plain almost as level as a billiard table, its broad and regular streets, substantial business houses and general look of solid prosperity impart to it the look of a town established for years. Yet less than twelve months ago the site of Anaconda was covered with willows, and no one resided within half a dozen miles of the spot. To-day there are 500 people there, and when the season fairly opens there will be between 1,500 and 2,000 permanent residents. The smelter is not the sole support of the town. It is the trade center of Upper Deer Lodge valley, and as the demand for farm products will be great, the farmers will, of necessity, transact all their business at Anaconda. There is no town in Montana with a more assured and prosperous future.

A Test for the Hydraulic Pumps.

The *Virginia Enterprise* says: Yesterday morning at one o'clock a blast in the face of the north drift on the 2600 level of the Savage started a flow of from twenty to twenty-five inches of water. This water flowed out to the Combination shaft with a rush, owing to the clogging of the drain boxes, and the debris collecting here and there forming little temporary dams. This sudden increase of water was a good test of the hydraulic pumps, and they performed splendidly, easily handling the water. Though the men who were at work at the bottom of the Combination shaft below the 2600 level were for a time drowned out, the pump was drained, and they resumed work again last evening.

The water streak tapped seems to run up to the 2400 level, as the flow of water there decreased about fifteen inches. It must be that a crevice of some kind was tapped, as the water would not have rushed out so suddenly from mere wet ground. There are reports that some quartz was brought out by the water, but we could not learn anything regarding its value. Such sudden flows of water generally come from the vicinity of belts of quartz. The place will perhaps be explored when it dries out.

On the 2200 a very heavy flow of water was struck some years ago, and gave much trouble until the drift whence it came was bulkheaded. The place is now perfectly dry, but thus far it has not been explored, and the hole from which the water came examined.

MECHANICAL PROGRESS.

Expansion of Metals in Melting.

A foreign journal notes the following experiments on the expansion of metals at melting points, and the comparative rates of cooling of certain alloys and tin. The experiments were made by Herr E. Wiedemann, and the dilatometer method was employed. The substance was inclosed in a glass cylinder, tightly fitted, at the upper end of which a capillary tube was affixed.

The most convenient liquid for filling the apparatus was found to be oil, which has the advantage of not evolving air when heated to 200; moreover, it does not possess an appreciable vapor tension at that temperature. When heated above that point, the oil attacks the metal. The rate of cooling was determined by heating the metal to 260 in an iron vessel. A thermometer, protected by a glass cup filled with oil, was inclosed within the molten mass. The whole apparatus was then immersed in a double-walled metallic vessel, the intermediate space between the walls being filled with water. The intervals of time required for cooling five degrees were carefully measured; the reciprocal value for these times may be taken as a measure for the velocity of cooling of the metal. In three experiments it was found that tin on melting expanded in volume 1.76, 1.69, 2.20 per cent. These results are in direct contradiction to those of Nies and Winkelmann, who melted a large quantity of the metals, and then dropped in a solid fragment of the same metal, and observed whether this fragment floated or sank. But the author points out that in this method it would be exceedingly difficult to avoid convection currents, which would be liable to carry up the solid fragments to the surface in the center of the vessel.

Experiments also proved that soft solder expands almost 2 per cent of its volume in melting. An alloy of bismuth and lead, corresponding to $Pb_{45}Bi_{55}$ of sp. gr. 11.4, begins to show an increase of expansion at about 120°-136°, which reaches its maximum at 180°.

The results of these experiments show that these alloys contain a definite compound of composition between $Pb_{45}Bi_{55}$ and $Pb_{50}Bi_{50}$, whose melting-point is about 125°, and in which the excess of one metal, lead or bismuth, as the case may be, dissolves. For equal increments of temperature, the proportion of the metal dissolved rapidly increases. From the changes of volume at temperatures above the first melting-point, one can conclude whether the metal in excess expands or contracts on melting. The experiments would seem to indicate an expansion of lead and a contraction of bismuth, a result in accordance with previous observations. For example, the alloy $Pb_{45}Bi_{55}$ consists of an alloy of low melting-point, in which the excess of bismuth dissolves; if it be gradually warmed to 120°, the alloy and the excess of bismuth expand regularly. At this temperature the alloy melts with marked expansion and contains the solid bismuth in suspension; above that point the bismuth gradually dissolves and melts.

Papered Veneers.

About the year 1868 it was discovered that it was possible to make wood veneers of such extreme thinness that in some cases it would take 175 of the sheets piled upon each other to make an inch. These were handsome, and could be successfully applied to a surface, but they failed in one most important particular—they would crack and curl. It remained for Charles W. Spurr to devise a plan whereby this defect was remedied. That gentleman found upon experiment that when this thin wood was expanded to its natural capacity, and in that condition applied to a piece of paper, it ever afterwards remained in that condition, neither shrinking nor expanding after it had been applied as a veneer. This is the process: The logs, which embrace all the many kinds of rare and handsome woods, are halved or quartered and placed in a large tank, where they are steamed for the purpose of expanding the water already contained in the sacs of the wood. The log is taken out in this moist condition and bolted upon a revolving section of a ponderous machine, which weighs over 30 tons, and which, at every revolution, throws off a thin board 12 feet long and from 1.90 to 1.75 of an inch in thickness. After cutting, the wood is taken still wet and applied to a sheet of paper. The paper is also wet at the time. After this papered veneer is dried it is a perfect compound and cannot be separated. After the wood is backed with the paper it is hung up and dried, and is then ready for use. The uses to which these paper veneers can be put are many, and the article has grown steadily in popular favor. It makes a handsome covering for the walls of rooms. It can be attached to the plastered wall, and after it has received the finish it can be washed whenever necessary. The beauty of the wood improves with age; it even strengthens the walls, while steam or furnace heat, dampness or frost have no effect upon it. This product is excellently well adapted to the manufacture of furniture, and the advantage which the veneers have been found to possess for this kind of work may be briefly summed up as follows:

No waste or injury in storage or careless handling; many sheets can be cut at once, without ruining brittle wood; 100 pounds of glue will lay as much surface as 250 with ordinary veneers, twenty minutes under pressure, instead of twelve hours, keeping the press going all day; no delay for glue to set, but being immediately sand-papered, instead of planing, scraping and sand-papering; less than one-half the amount of filling and finish, with marked clearness of color and brilliancy, and durability under circumstances fatal to the ordinary veneers and finish, from the absence of glue in the veneer of finish. Still another use to which paper veneers may be put is in the binding of expensive books, such as albums. Experiments are constantly making which widen the sphere of usefulness of this article. — *Lumberman's Gazette.*

THE SERVICE OF CAR WHEELS.—The following facts concerning the relative durability of steel tired and cast iron car wheels are taken from a paper read by Mr. John M. Ford at a meeting of the Master Car Builders' Club, held at Boston, January 30th, and are based on statistics from the passenger coach service of the Boston & Albany railroad for the past year: During the year 1883, 180 Hartford steel-tired wheels had been removed as worn out. The average mileage was 245,980 miles, the minimum being 63,500 and the maximum 470,000 miles; the average time in service seven years, eight months and three days. Out of 180 wheels worn out the great majority, 131, ran over 200,000 miles, and only about three per cent of the total number ran under 100,000 miles. The average mileage of worn-out cast iron wheels removed during 1882 was 29,074 miles, and it would there fore appear that a steel-tired wheel will outlast eight chilled wheels, which latter only ran on an average 332 days. Speaking of the best material for ties, Mr. Ford said crucible steel of good quality, containing about one per cent of carbon, is four times as strong as cast wheel iron, and machinery steel containing about thirty per cent of carbon gives nearly the same breaking strain with a fibrous fracture. This metal is too soft for wheel tires, but steel made in crucibles from Swedish iron, with seventy-hundredths to eighty-hundredths per cent of carbon added, hammered and rolled, will produce a perfectly safe and durable tire.

ONE ADVANTAGE OF AMERICAN MACHINERY: Lionel Garden, British Consul in Mexico, says in a recent report: "In a general way, it may be said that it is the weight of English machinery which places it at such a disadvantage when compared with that from other countries, and especially from the United States. In Mexico, owing to the enormous freights and the expense of handling, it often happens that bulky articles of no great value have to pay for transport alone from the factory to the city of Mexico from 50 to 100 per cent of their original cost, independent of the duties (if the goods are dutiable) and other charges and commissions, and independent also of the further cost of transport to their ultimate destination. It stands to reason, therefore, that the lighter a machine can be built, without prejudice to its strength and durability, the better it is suited to this market, and the position that American machines occupy here to-day is due, in very great measure, to the recognition of this fact by American manufacturers."

IS PUDDLING NECESSARY?—A comparatively new process in the manufacture of low carbon Bessemer steel, says an exchange, was tried a short time ago at the works of the Pittsburgh Bessemer Steel Co., which, if after sufficient trial, is found successful, will completely revolutionize the work of puddling, doing away with that process altogether. Heretofore but little Bessemer steel has been made below a certain degree of carbon, which renders it impracticable to use for many purposes for which wrought iron is employed. But by late experiments under the present management, by the above works, steel is expected to be made as low in carbon as 1.600th of 1 per cent, which, the superintendent states, will answer all the purposes for which wrought iron is used.

STRAIGHTENING SAWS.—A late improvement consists in tempering and straightening saws at one operation. This is done by heating the saws to a proper degree, and then pressing them by a sudden and powerful stroke between two surfaces of cold iron, a drop press being employed for the purpose. The use of this mechanism effects a very considerable economy in the manufacture of the article.

COST OF PIT IRON.—The actual cost of making a ton of iron in the Lehigh Valley, Pa., is put down by Mr. McCreat, chemist of the Geological Survey of Pennsylvania, at \$20 38, itemized as follows: Ore, \$9 34; coal, \$5 30; limestone, 77 cents; labor, \$2 33; incidentals and repairs, \$2 64.

DIAGONAL JOINTS FOR BELTS.—Instead of making square joints in belts where laps occur, why not run them diagonally? There would be more holding surface in the lap, and a gradual strain on it instead of a double one, where it passes over the pulley.

SCIENTIFIC PROGRESS.

Some Recent Scientific Discoveries.

Mr. Hughes' researches, which tend to show that a magnet is made up of a great number of atomic magnets or molecules, is, perhaps, the most interesting of the many papers on electric science which have been published in the course of the last twelve months. Several new comets have been detected, and, as one of the conclusions derived from the recent transits of Venus, it is announced that the sun's distance from the earth is 92,700,000 miles.

Dr. Hughes has succeeded in photographing the sun's corona by producing an artificial eclipse, and, among other applications of photography, a compass has been devised by which a ship's course can be unerringly chronicled by aid of the sun, thus no longer rendering captains and courts of law dependent on the veracity of steersmen or the entries in log-books.

Prof. Langley has shown that the normal color of light is not white, but bluish, and in chemistry, which, like physics, has for the most part been "practical" in its labors, a new species of explosive—one of the dynamite family—known as "panclastite," ought to be credited, or discredited, to M. Turpin.

In biological science, though the amount of work done has been considerable, there is less of popular interest to note.

The curious fresh-water jelly fish which appeared so mysteriously in the Victoria tank in the Royal Botanic Gardens, in Regent's Park, has again shown itself; and, as indicating that the botanist has not yet exhausted the globe, the island of Socotra, in the Red sea, has yielded to one visitor no fewer than thirty-seven new species of plants. But perhaps the most important discovery in biology which 1883 has to boast of is that which tends to prove that the protoplasm in cells passes through their walls, uniting them with other cells, contrary to the view formerly held. Should this statement be generally confirmed, it will rank among the greatest of the year's achievements. — *London Standard.*

The Growth of Electrical Science.

At the first meeting of the current session of the Society of Telegraph Engineers and Electricians, held on January 10th, Professor W. G. Adams, F. R. S., in his inaugural address, delivered in the lecture hall of the Institute of Civil Engineers, speaking upon the subject of "The Rapid Growth of Electrical Science," said that 100 years ago Cavendish, though far behind our age, was much in advance of the men of his time. He quoted figures to show that the result which Cavendish had obtained in his experiments in connection with the measurement of electrical force were remarkable for their accuracy as shown by their close approximation to the results recently obtained by the aid of the efficient instruments that were now used in the solution of such problems. The progress of electrical science had been marked by steps similar to those which were found in the history of other sciences. The gradual collection of observation of facts gave rise to new theories and new inventions, which in turn were the sources from which other facts, theories and inventions were derived, but the rapid progress of the science was largely due to the fact that it had been the pursuit of men like Faraday, Maxwell, Thompson, Siemens and others; men who had not only the capacity to perceive what was required, but likewise the ability to discover and supply that which was needed. In illustration of this remark, Professor Graham spoke at some length upon the leading inventions of Faraday, Thompson and Siemens, and said that the importance of the results derived from the introduction of accurate instruments of measurement was clearly proved by the history of the science during its most recent period. Referring at the end of his address to the principal events of the year in connection with electrical science, the Professor gave some technical details of the manner in which electricity had been utilized as a motive power for tramways and railways.

A Pocket Apparatus for Air Analysis.

Since the unwholesomeness of the air in a room or hall is nearly proportional to the percentage of carbonic acid (carbon dioxide) in the air, Dr. Wolfert, of Kaiserlautern, has devised a very simple apparatus for estimating this suspicious constituent approximately, to be used in school rooms, sleeping rooms and public halls.

A small glass cylinder is filled to a certain mark with perfectly clear lime water, a very cheap article to be had at any drug store, or easily made at home. He then takes a small india-rubber ball or bulb, with a glass tube attached. On squeezing the ball until all the air is expelled it will, of course, fill itself with the air of the room. The tube is then allowed to dip into the lime water, and the air made to bubble through it slowly but steadily, squeezing the ball. When all the air is expelled, remove the tube from the lime water and allow the ball to fill again, taking care that no lime water is sucked into the tube or bulb. This is

repeated until a precipitate of carbonate of lime is formed which obscures the numbers on the bottom of the cylinder. The number of times it must be repeated to effect this end increases with the purity of the air. Accompanying tables give the percentage corresponding thereto.

If the lime water is rendered so turbid as to be opaque by less than ten repetitions, the air is very bad, and cannot be breathed with impunity. If it requires from ten to twenty repetitions, a person may remain there for a short time. When more than twenty repetitions are necessary, the air is good enough for ordinary purposes. In sick rooms it should require at least thirty, and in contagious disease, forty to fifty. The purer the air, of course, the longer time the tests will take.

A NEW COMPASS.—M. Mascart, the well known electrician, has devised a new compass which finds the magnetic meridian by the well known experiment of moving a coil of wire across the lines of magnetic force of the earth and inducing a current in them. M. Mascart employs an azimuth circle on which is mounted a ring movable around the horizontal axis. The angle, made by the ring with the horizon, is measured by a vertical circle. A coil of 0.12 meters in diameter is carried by the ring and can turn around an axis perpendicular to that of the ring. The size of the apparatus is not greater than an inclination compass. It acts on the principal that when the axis of rotation of the coil is in the magnetic meridian the induced currents in the ring when rotated will be nil. A sensitive galvanoscope is employed to show the induction current. In using the apparatus a series of trials show that the axis of the ring is perpendicular to the magnetic meridian. A second series place the axis of rotation of the coil in the line of the inclination needle. The observation, with checks, occupies half an hour, which is less time than is necessary to find the inclination by a magnetic needle. From observation made at the Observatory of the Parc Saint Maur, by M. Moureaux, the new compass seems to be as correct as the inclination compass.

A VALUABLE PHOTOGRAPHIC IMPROVEMENT.

An invention has quite lately been perfected by Mr. Edward W. Fell, of Cleveland, O., which, it is claimed, ranks with the electric light and telephone. The invention consists in taking absolutely permanent pictures upon any substance whatever having a smooth surface, instantly, by the action of electricity, upon a sensitive coating, and at an expense not exceeding one cent per picture. Photographs on wood are not only perfect in outline and finish, but possess a peculiar softness not obtainable by any other process. This invention opens an entirely new and distinctive field in the art of photography, and will work a revolution in various branches of business into which it will enter more or less. None of the present processes are used; and it is not intended to interfere with the portrait work of the average photographer. The engraver upon wood, copper or shell need no longer consume time and patience in obtaining a defective counterpart of the object to be engraved, but instead, can, at a trifling expense, obtain a beautiful photograph directly upon the wood or metal upon which the engraving is to be made.

VELOCITY OF TIDAL WAVES.—M. Errington de la Croix has calculated the velocity of propagation of the tidal wave caused by the volcanic eruption of Krakatoa. The final moment of the explosion was about 12 minutes to noon, when a gigantic wave was formed in the Straits of Sundra. But the same day at 1:30 P. M., a tidal wave was felt on the coast of Ceylon, notably at Point de Galle. Assuming that this was the same disturbance propagated across the 1800 miles of sea dividing Point de Galle from Sunda, M. de la Croix calculates the velocity of propagation to be some 1,200 miles per hour, or 1,804 feet per second. Further data from the Island of Mauritius affords a check on this result. Here the distance is 3,300 miles from Sunda, and the tidal ebb was felt at 2:15 P. M. Hence the speed per second works out as before—1,804 feet.

CONDENSATION OF CARBONIC ACID GAS UPON THE SURFACE OF GLASS.

Prof. Robert Bunsen has recently published the results of his investigations upon the film of carbonic acid that adheres to the surface of smooth, clean glass. He found that the quantity gradually increased from year to year, and more rapidly in cold weather than in warm, but change of barometric pressure makes no difference. In three years over 5 c. c. of carbonic acid gas had attached itself to the square meter (1,600 inches) of surface, and had been compressed to 0.05 c. c., which represents the very considerable pressure of 135 atmospheres. Bunsen thinks that there can be no doubt that it exists on the surface in a liquid form.

FIVE NEW COMETS.—Dr. Gould, Director of the Observatory at Cordova, Argentine Republic, telegraphs to the Minister of Instruction at Buenos Ayres, December 15th, that he observed five comets, all small ones. The Buenos Ayres *Standard* supposes that this may explain the unprecedented heat felt in the river Plate, 101° Fahr. in the shade at Buenos Ayres, where the glass rarely marks over 92 in midsummer (December-January.)

Passing Events.

Some of the men who have gone to Cœur d'Alene send back word that much exaggeration has been indulged in by those who have told the stories we have been reading for some time. Of course there is gold there, but it is not probable that the whole country will pay to locate.

The striking of the lead in the tunnel of the famous Drum Lummon mine is the most important strike yet made in Montana, considering the fame of the Drum Lummon and the figures at which it sold about one year ago. Had this tunnel failed to develop anything, all mining enterprises in Montana would have received a severe blow. As it is there are many spurs and extensions of this wonderful lode which soon will be developed, and Marysville will be a second Butte, no doubt in a couple of years.

The broken railroad connections have been repaired, and trains are running to Southern California on time again. The fine weather is favorable to mining operations and miners are taking advantage of it.

COPPER.—The latest Liverpool quotations for copper are as follows: Chili bars, £55 7s. 6d, sharp cast; ore of 25 per cent and good quality, 11s. per unit; Chili regulus, 11s. 3d. per unit. The total visible supply is 46,036 tons fine, against 43,658 tons fine on Feb. 1st. The English imports for the year so far aggregate 17,428 tons fine.**LEAD** in Liverpool has fallen to £11 15s. 0d. to £12 for English, and £11 10s. to £11 12s. 6d. for Spanish.**ANTIMONY** is selling in Liverpool at £44 to £46 for French Star.

A New Quartz Mill.

A representative of the PRESS examined, in operation this week, at No. 52 Bluxome st. in this city, a new form of quartz mill, designed by Frank A. Hill. The machine is quite simple in construction and operation. It is circular in form. In a suitable bed is a circular V shaped groove or channel, open at the bottom, in which are nine steel rollers or wheels of corresponding shape on their edges. These rollers or wheels set on edge in the channel. Above them is a large open casting having an inverted V-shaped circular groove, in which the upper part of the rollers fit. This upper casting is given a rotary motion by means of an upright shaft and gearing similar to that of an ordinary amalgamating pan. As the weight of this casting rests on the upper edges of the rollers, they are revolved rapidly in a circle in the grooves provided for them. The upper casting is open at the top, and ore, which is first passed through a rock-breaker, is led into the machine by a suitable spout, with a stream of water. As it falls into the interior it finds its way into the V-shaped channels, and the broad faces of the rotary rollers crush it. The centers of these rollers are open, to allow the quartz to have free motion all over the machine. The ore is crushed both in the lower and upper channels. The rollers run free, but close together. Around the series of rollers is a circular screen, through which the pulp passes, the discharge being all around the mill. Below the screens is a circular apron, on to which the pulp falls, and which is provided with amalgamated plates. From this the material falls into the usual sluices.

Provision is made to add more or less weight to the upper casting, so as to increase the capacity of the crushing rollers. A small derrick is arranged to handle these extra weights, and to lift the casting when the mill is to be cleaned up. The V-shaped channels have removable dies made of steel, and the rollers themselves are made of steel. One of these machines are now being made ready to run at a mine in Tuolumne county, in this State. The weight of the whole thing is about 3,000 pounds. It was crushing ordinary granite through a 40 screen when we saw it at work, and seemed to be getting it through pretty fast, running at a speed of 53 revolutions per minute. Mr. Hill will be glad to show the machine in operation to all persons interested in such matters, and they can see for themselves the work it can do. He is confident that the machine has a large capacity, and is a practical invention, in which opinion many mining men who have seen it concur.

Manufacturing Interests.

We have several very important things to learn, as a community, before we will be as prosperous as we should, considering our resources. We want to make up our minds to manufacture everything we can, and to let as little of our raw material go away as such, as may be. When in the Southern States they grew cotton and sugar cane, and sent the former all off to be made up and the latter to be refined, they were always poor. Now they manufacture cotton yarn and goods and refine their sugars, and are prosperous.

We ought here in California clean and prepare our wool, and make it up into yarn, hosiery, clothing and blankets. Our hides ought all he tanned, made into leather, and into shoes and harness; and our excellent native woods should be made up into furniture, etc. We might go on and mention a score of products which we now send away, and the profits of manufacture of which accrue to others.

We are already seeing that it will pay us to make flour instead of sending away wheat, for the profit of manufacture remains at home. Immense mills are now being made at Carquinez Straits for this purpose. There are also woolen mills, tanneries and shoe factories. But the people do not appreciate their importance as factors of progress, nor does the number of factories increase as fast as it should. The geographical advantages of San Francisco, and the resources of the surrounding country, ought to make this city a larger manufacturing center than it has so far become. True, we see with satisfaction the strides it has taken of late, yet there is much room for improvement. The establishment of every factory, no matter on how small a scale, is one more step in industrial progress. Around each one gathers a little crowd of interested workers, and these small communities enrich the large one and make prosperous manufacturing centers.

Foundry Notes.

A Sun Engine.

At the California Machine Works (W. H. Birrh), in this city, they are about completing a novel piece of mechanism, in the form of a machine for utilizing solar heat. It is being built for the Solar Heat Power Co., of California, and is an experimental machine, with which it is intended to practically test the new principle employed.

The apparatus is intended for the collection or concentration and utilization of the sun's rays for industrial purposes. It consists essentially of a cylindrical heat-receiver of novel construction. The machine is designed so as to heat the water in a steam boiler and generate steam, the sun's rays furnishing the heat.

The receiver is made of sheet metal, with its outer surface lakened, and is mounted on a frame, to which it is fastened at each end. The frame is placed above the foundation of the machine, and is attached to it at one end by means of hinges, and the other end is supported by regulating screws, which are operated simultaneously by gears.

The arrangement is intended to raise or depress the frame so as to give the reflector and receiver the proper latitudinal inclination according to the different solstitial angles in summer and winter.

The reflector is a cylindrical surface of parabolic cross-section, mounted on trunnions fastened to the frame, and is caused to turn and follow the diurnal movement of the sun by means of worm gears. The receiver and reflector are set at right angles with the plane of the sun's course. The rays of the sun striking the surface of the reflector at the proper angle are reflected toward the focus and concentrated on the circumference of the boiler.

The quantity of heat conveyed on the boiler, other things being equal, will be in proportion to the dimensions of the reflector. By using a cylindrical reflector of parabolic cross-section in combination with a boiler of circular cross-section, having the same axis as the reflector, it is possible to concentrate the rays of the sun evenly on the whole length of the boiler, and not in circular spots or rings, as it has been done before, with cone-shaped or parabolic reflectors having surfaces of revolution, with the heat receiver placed vertically, or in other words, in the axis of the surface of revolution.

The apparatus is provided with an orienting device, the object of which is to enable the operator to see that the reflector is at the proper angle with reference to the image of the sun at all hours of the day.

When in operation the reflector is caused to revolve, and is elevated or depressed by suitable devices, and the beams of sunlight are so led that the sun's rays strike the reflectors at the proper angle for concentration on the receiver or boiler. The motions are accomplished automatically by metallic devices which are well known and need not be described here. The heat rays are concentrated on the boiler so that steam is generated, which operates an ordinary engine. Sometimes a glass jacket is carried on the boiler to diminish radiation.

By the arrangement described—a patented device of Geo. W. Deitzler—that is, conducting a reflector having a parabolic or other cross section, and placing the lines of the reflecting surfaces parallel to the axis of the boiler, which is the essence of the whole appliance, it is possible to expose to the sun long and broad surfaces of reflection within reasonable limits and workable conditions, the length and breadth of the reflector being limited only by the convenience of construction, and heat tubes or boilers of great length, the heat rays being concentrated on the surfaces to be heated in long lines, and with great evenness, each section of the boiler exposed receiving the same quantity of heat; whereas the reflectors heretofore used for this purpose being all of the inverted pyramid or cone style, present only small and narrow surfaces of reflection, and gather the ray in spots, a process necessarily quite limited in its practical application. The idea is, by the arrangement described to secure an even distribution of the heat which will act on the surface of boiler much like the flame of the ordinary furnace. The steam generated is utilized in an ordinary engine for any desired purpose. For the southern part of this State, for Arizona, New Mexico, and Mexico, where there is so much hot weather, these engines may be applied to many purposes, such as pumping for irrigating, etc.

Patent Infringements.

In the last two cases tried here for infringement of patent, the inventor has proved his case and made the infringers pay damages. A decision in favor of the plaintiff in the case of John D. Winters vs. Donald Crane and others has been rendered by Judge Sawyer in the United States Circuit Court. The suit was for damages on an infringement of an improvement in wagon derricks, and the Court ordered an interlocutory decree, which was referred to the Master in Chancery of the Court to ascertain and report to the Court whatever damages had been sustained.

In the case of John Reynolds vs. Henry L. Dodge and Alexander Martin, United States Circuit Judge Sawyer recently rendered a judgment to the effect that the letters patent issued to plaintiff March 20, 1866, are good and valid in law; that the defendants have infringed upon said letters by using the same in the United States Branch Mint in this city; that plaintiff recover from defendants the profits which have accrued to the government of the introduction of the invention, and that the matter be referred to S. C. Houghton, Standing Master in Chancery, to ascertain the amount due plaintiff. The invention alluded to consists in boiling crude hulsion in sulphuric acid or nitre, without melting and alloying it with copper and granulating it before refining, as the practice had previously been. The Master reports: "I have, therefore, ascertained and report that since the 20th of March, 1866, 188-, 489.62 ounces of hulsion have been refined by the complainant's said patented process in the United States Mint at San Francisco, Cal., by or under the directions of respondents; that there has thereby arisen and accrued to the government of the United States as advantages equal to the saving in expense by the use of said process in said mint, which is the sum of \$140 upon each 50,000 ounces of hulsion treated at said mint by said process, and that the total saving or advantage which has so arisen and accounted to the government of the United States amounts to \$52,777 05."

The Cœur d'Alene Mines

There is not the least doubt that three quarters of the thousands of men who will be in the Cœur d'Alene mining region within the next two months will be disappointed in their hopes of a fortune. At the same time, this thought, though it may occur to many, will deter few who think of going. Of all classes of people in the world, miners and prospectors are, perhaps, the most hopeful. Each thinks that he, at least, will strike it rich. Repeated failures, expended money, useless work and lost time only stimulate them to renewed endeavors and increased effort. There are thousands of these men who expect to retrieve their fortunes at the new placers; and they will overcome every difficulty to get to the new region. Telling them of the rigors of the climate, the schemes of the traders, the misrepresentations of the transportation companies or the narrow limits of the mining area, will not damp their ardor. They have made up their minds to go, and go they will.

Yet of late many discouraging reports have been received from the new mines. That is to say, men who are there say there has been much misrepresentation about the country, and that reports of the gold finds are highly exaggerated. No work has been done this winter which would prove the assertions of the men who are "hooming" the region. One man writes from the new mines to a Nevada paper that "the camp is the worst humbug that ever saw the light. It is worse than the famous diamond swindle. There isn't enough gold in the cursed diggings to plate a spoon with, and what little there is can only be found under forty feet of snow. Any man who wants to work like a nigger and make about a dollar a day, will find this country just the place." Most of the miners there have been through White Pine, Salmon River, Frazer River, or some other excitement, and they know what a stampede is. Many have confidence in the placers and in the quartz ledges, but they expect to see the usual crowd who rush in expecting to make money easy, go out dead broke and disgusted.

In addressing letters to Belknap, the new boom town on the Northern Pacific, be sure to add Missoula county, as there is a postoffice called Belknap in Choteau county.

Publication of Mining Notices.

It has been decided officially that the selection of newspapers for publication of mining notices is a matter resting in the sound discretion of the United States Registers, within the limits prescribed by section 2325 of the Revised Statutes; but, that other things being equal, the convenience of the applicant should be consulted. The case grew out of a refusal on the part of a certain Register to publish notices of intention to apply for a patent to a mining claim in a certain newspaper.

The grounds of complaint were substantially as follows: Before making application for patent, on behalf of certain clients, for four mining claims, Mr. Arnold obtained terms from the two newspapers published at the mining town in the district. One of them offered to publish notices of the four applications for \$90, and the other for \$48, thus making a difference in cost to the applicants of \$42. Upon filing the applications, he requested the Register to direct publication in the cheaper of the papers, both being published equidistant from the claims. This the Register refused to do, unless the proprietor of the one making the lower bid would enter into bonds with him for the continuance of regular publication of his paper during the sixty days required by law.

The Commissioner of the Land Office called on the Register for an explanation of his refusal to allow the notice to be published in the paper charging the least. He explains his action by stating that he did not at the time and does not now regard the paper referred to as "a reputable newspaper of general circulation." Also, that in cases where he has doubts as to the stability of a newspaper, it has been his custom to require bonds for the continuance of publication, similar to that mentioned above, and that such bonds have been promptly furnished by other papers.

The complaint raises the question, What is the legitimate discretion of the Register in regard to the publication of notices?

Section 2325 Revised Statutes, U. S., provides that the Register shall publish the notice "in a newspaper to be by him designated as published nearest to such claim." This section, according to the construction adopted by the department, vests a discretion in the Register even as to papers published at unequal distances from the claim, and he may exercise his official judgment in designating a paper which is not the one published nearest the claim, under certain circumstances. Where papers are published equidistant, or very nearly so, from the claim, the decision rests entirely with him. The Commissioner of the Land Office says in his letter to the Register: The power of designation in the latter class of cases, to which the one under consideration belongs, being given by the law to the Register, I do not feel authorized to interfere with his decisions. Moreover, he assigns as a reason for his action a fact that would justify him in declining to order publication in the *Journal*, even if that paper were published nearer the claim than any other paper, viz.: that in his opinion it is not "a reputable newspaper of general circulation," as required by the rulings of the Department.

It does not seem to me that the Register has exercised the power conferred upon him in an arbitrary manner. He has offered to publish notices in the *Journal* if its proprietor would assure him, in a manner which does not appear unreasonable, that its publication would not be interrupted. No objection has been made to similar demands in other cases. Without some such assurance, and entertaining doubts as to the stability of a paper, he would violate his duty if he should direct publication to be made therein. His action in the present case seems to be entirely proper. For these reasons I must decline to interfere in the matter. I wish to add, however, that where two or more papers of repute and general circulation are published equidistant, or very nearly so, from a mining claim for which application has been made, the Register should be guided in the exercise of his discretion by a due regard for the convenience of the applicant, all other things being equal.

The Lane mine, in the Bradshaw mountains, Arizona, has been sold to T. J. Eaman, for \$20,000.

Industrial Notes.

The first leather manufactured in Ukiah, Mendocino county, has just been turned out of the new tannery there.

The Standard Soap Company, of Berkeley, intend erecting works to save the glycerine contained in fats, for which there is a large demand in manufacturing nitro-glycerine at the neighboring powder works.

Over 400 men are in steady employment at the Judson Manufacturing Works and the California Iron and Steel Works, at Emery station. About 2,000 Victor mowing machines will be turned out at the former factory this season.

The new oil works of the Arctic Oil Company, at South San Francisco, are rapidly approaching completion. The machinery is nearly all in position, and the corrugated iron roof will soon be on, and it is expected that the entire affair will be in working order by April 15th. In a few months refined oils of home manufacture will be on the market.

Congressman Roscerans has forwarded to the Labor Bureau here an invitation sent out by the Pennsylvania Museum and School of Art to California manufacturers of porcelain, glass and pottery, announcing an exhibition of these articles. Decorations on porcelain are to be especially classed, and it is on account of the numerous workers in that branch of industry that the Labor Bureau calls attention to the circular.

Deane Brothers' Steam Pump Works have recently received orders for their independent air-

Retort and Condenser.

Last week we illustrated a form of retort for silver amalgam, and on this page we give an engraving of a retort and condenser for gold amalgam. The retort is turned smooth inside, and is of a shape peculiarly adapted for rapid and complete exhalation of the quicksilver. Of course this can be used for silver amalgam if desired.

The condenser attachment, shown in the cut, which is made of either brass or iron, is, as will be observed, of very important use in facilitating the process of retorting by decreasing the time required, and permitting of a more perfect condensation of the quicksilver through its automatic action; adding but little to the cost, and can be applied to any retort pipe, as it is not a fixture, and if made of brass will not rust. The rubber bag attached to the end of the retort pipe prevents all danger of explosion. It should, of course, be immersed in a vessel containing water. The distension of the bag indicates that quicksilver is still being condensed, and its collapse indicates that the operation is complete. The Hendy machine works have these appliances. The tripod or retort stand can be made by any blacksmith.

Gold in Black Sands.

In Mr. Paul's article of last week on this subject he said that the great loss of gold in one hydraulic drift and river working is in that

IMPROVED AMALGAM RETORT AND CONDENSER.

pump and condenser from the Logansport (Ind.) Electric Light Company, Clinton (Iowa) Water Works, Yaeger Mill Company, Kane, Ill., and Brush Electric Light Company, Indianapolis. Deane Bros. are getting out patterns for a new line of duplex pumps.

The cigar-makers' strike is at an end, the locked-out Chinese agreeing to return to their work without any concessions from the bosses. The conditions under which they returned are that they resume work before any agreement is entered into; that they do not ask for any advance under twelve months from date; that the cigar-makers employ any workmen they see fit, regardless of non-membership in the Chinese Union, and finally, on the bosses' part, an advance of fifty cents per thousand on the higher grades of goods was conceded. Still the experiment of the school for teaching white boys and girls to make cigars is to be continued with a view of eventually displacing the Mongolians entirely. The Board of Directors will be required to file a bond in the Internal Revenue Office of \$500 for the school, as it has been decided that it will properly come under the head of a factory. The law also requires that a bond in \$100 shall be filed for each person employed in any factory where cigars are manufactured. As the Directors expect to have 500 boys and girls at work within a short time, a bond of \$50,000 will be required.

The Excelsior Mining Company, of Smartsville, has about 44 miles of ditches, furnishing a minimum supply of 3,000 inches of water. The Golden Gate Company, of the same place, has 28 miles of ditches, and its least supply is 500 inches of water.

Value of Tailings.

If miners are apt to allow themselves to be fooled on the probable average value of ore in a mine, taking as a basis assays of ore of a class which they ought to know to be above the average, they are still more apt to be misled on the subject of the value of tailings. Most mine owners think their tailings are worth more or less money. The mill superintendent is perhaps the only one who does not believe in the value of tailings. He may think those left by his predecessor have a good deal in them, but you cannot easily make him believe that the ore he has worked has not yielded pretty much all its precious contents.

There is no doubt that old piles of tailings from ore worked many years ago, in which the sulphurets have had time to decompose more or less, by exposure will often pay to work. The old-fashioned haphazard way of working ore made rich tailings. There are instances where tailings worked three times over have paid each one who worked them. But it by no means follows that every pile of tailings is worth working.

The writer has in mind an instance where, at a gold mine which had been worked at a profit for many years, there was a pile of several thousand tons of tailings. They had been systematically turned and shoveled over several times in order to facilitate decomposition of the sulphurets. High assays had been obtained, and the pile was always spoken of as a

good mine in itself. By and by, some experienced and practical men were induced to make a long journey to see these tailings, with a view of working them on shares. They went systematically to work to get an average of the pile, spending a couple of weeks in the work. They found that, taking the pile right through, the tailings were worth only about \$5 per ton. In the locality referred to it would have cost more than that to work them. The men who own the pile, however, still think it worth about \$20 per ton. Though as this was some time ago, and they still want to sell, not work, the batch, it is probable the \$5 average was nearer the truth.

Some old slag dumps and many old tailings piles have paid those who have worked them very well, but it is not always proper to estimate a tailings pile very high in the assets of a mining company.

A case, however, where tailings figure high in this connection, is that of the famous Alice mine, at Butte, Montana. In the recent official report, which has occasioned so much comment, there is this paragraph: "There are two large reservoirs of tailings which contain about 70,000 tons, at an estimated average value of \$5 50 per ton, making \$385,000. This does not include the quicksilver and amalgam which has been lost in the process of milling."

This is of course encouraging to stockholders, and is supposed to show they have something for the money they have expended, even if it is in the doubtful shape of "tailings." But the Butte *Inter-Mountain* says of the statement, "It is insulting to common intelligence. There is not a man, woman or child in this camp that does not know that the Alice tailings reservoirs are absolutely worthless. We would be willing to wager that were it not for the sake of appearances and the desire to have some 'assets' on hand, Mr. Walker would take \$10 for the entire 70,000 tons. This '\$385,000' does not include the quicksilver and amalgam which have been lost in the process of milling," says the report. This makes the matter still more ridiculous. But admitting that the value of the quicksilver and amalgam equalled the silver and gold value of the tailings, which is of course not the case, and that the value of the tailings was \$11 per ton; it would still be preposterous to claim that the tailings would pay to work. Seventy thousand tons of limestone would be far more valuable. It is not justifiable to put a value upon that which is valueless."

The annual report of the Omaha Smelting Works Company puts the production of 1883 at \$12,700,000. This is an increase of 33 per cent over the output in the preceding year. The force employed last year averaged 350 men. Over 17,000 tons of coal and 8,000 tons of coke were consumed, and \$750,000 paid to the Union Pacific Railroad for freight charges.

associated with black sand. In the table given, one of the headings, viz: that referring to "drift mines," was accidentally omitted, so we repeat the table corrected as follows:

Tests from Hydraulic Mines.

No. 1, per ton	\$22 20
No. 2, per ton	80 00
No. 3, per ton	347 00
No. 4, per ton	28 75
No. 5, per ton	168 00
No. 6, per ton	12 00
No. 7, per ton	475 00
No. 8, per ton	54 00
No. 9, per ton	221 80
No. 10, per ton	240 00
No. 11, per ton	90 00
No. 12, per ton	140 00
No. 13, per ton	98 00
No. 14, per ton	152 05
Average, per ton	\$152 05

Lowest Tests from Drift Mines.

No. 1, per ton	\$6 00
No. 2, per ton	15 80
No. 3, per ton	65 50
No. 4, per ton	271 80
Average, per ton	\$103 25

Lowest Tests from River Mining.

No. 1, per ton	\$10 00
No. 2, per ton	27 90
No. 3, per ton	15 44
No. 4, per ton	17 78
Average, per ton	\$14 21

Test of Ocean Beach Sands.

No. 1, per ton	\$0 32
No. 2, per ton	2 10
No. 3, per ton	3 50
No. 4, per ton	18 50
No. 5, per ton	18 00
No. 6, per ton	2 30
No. 7, per ton	1 35
No. 8, per ton	80
No. 9, per ton	4 20
No. 10, per ton	1 75
Average, per ton	\$6 82

There was no very close concentration of these sands, is what Mr. Paul wrote—not "concentration of these sands."

The Anaconda mine of Montana ships 25,000 tons of ore a month over the Northern Pacific railroad.

Experiment Stations.

A very important measure to aid practical science is now pending before Congress. On the 10th of December, 1883, the Hon. A. J. Holmes, of Iowa, introduced a bill "to establish National Experiment Stations in connection with the Agricultural College of the various States."

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That in order to enable the Department of Agriculture to fulfill the design and perform the duties for which it was established, as declared in the organic act creating the said department, to-wit: "to acquire and diffuse among the people of the United States useful information on subjects connected with agriculture in the most general sense of that word, and to procure, propagate and distribute among the people new and valuable seeds and plants," institutions shall be established in connection with each of the agricultural colleges in the State providing such colleges, with an improved farm in connection therewith, and placed under the conduct of such colleges, to be called and known as "national experiment stations."

SEC. 2. That it shall be the object and design of the said national experiment stations to conduct original researches or verify reported experiments on the physiology of plants and animals, the diseases to which they are severally subject, with the remedies for the same; the chemical composition of useful plants at their different stages of growth; the comparative advantages of rotative cropping as pursued under a varying series of crops; the capacity of new plants or trees for acclimation within the isothermal limits represented by the climate of the several stations and their vicinity; the analysis of soils and waters; the chemical composition of manures, natural or artificial, with experiments designed to test their comparative values for raising crops of different kinds; the composition and digestibility of the different kinds of food for cattle; the scientific and economic questions in the production of butter and cheese, and all other researches of experiments bearing directly on the agricultural industry of the United States.

SEC. 3. That the said experiment stations shall be placed under the general control of the regents or trustees of said agricultural colleges, who shall have power to employ a professor for each agricultural college who shall act as superintendent of the experiment stations established under this act.

SEC. 4. That the said professors shall make such reports to the Commissioner of Agriculture from time to time as he may direct. The general character of the work and of the experiments to be performed at each station shall be determined by the Commissioner of Agriculture, the president of the college where the station is located, and the professor in charge of said station.

SEC. 5. That to each agricultural college providing for experiment stations under this act, to pay the salaries of the professors and superintendents of the said experiment stations, the wages of the laborers employed in their operations, and the cost of the experiments and researches connected with their conduct as heretofore specified, the sum of fifteen thousand dollars is hereby appropriated out of any money in the treasury not otherwise appropriated, or so much thereof as may be necessary to cover expenditures actually made for said purposes; the money to be drawn quarterly from the treasury of the United States, upon a certified statement of the amounts actually expended at each station, properly indorsed by the college board of audit, the professor in charge, and the Commissioner of Agriculture.

SEC. 6. That upon the passage of this act, before the agricultural college in any State can draw any funds as provided, the Legislature of such State shall pass an act accepting such trust and agreeing to conduct an experiment station in accordance therewith.

This is the movement toward the establishment of experiment stations to which we alluded last week. The measure is a wise one and we trust it will be enacted without fail at the present session of Congress. It will be just what is needed to continue and extend the valuable experimental work which is being done at Berkeley, and in other parts of the State, under the supervision of Professor Hilgard. In fact, the internal evidence in the above bill shows that it took its cue from articles which Professor Hilgard published in the *Atlantic Monthly* nearly two years ago, and it would give him much satisfaction, no doubt, to carry forward in this State this work to which he is so thoroughly committed, and for which he is exceptionally prepared. Some of the California representatives at Washington have already declared themselves in favor of the measure, and we hope the representatives from other States are similarly disposed. It will be a graceful act of the government to do for the agricultural interest.

A BRAVE MINER.—Wm. Clemon, one of the miners who was ordered to give up his money to highwaymen, at Nevada City, Saturday night, saved his coin by a bold dash. He threw his dinner-bucket at the robbers, and ran off. He was fired at two or three times, but the shots did not take effect.—*Grass Valley Union*.

Miners in the Winter.

Hundreds of miners are snow-bound in the mountains of Colorado, says the *Denver Republican*, and must remain so for several months. It is interesting to glance at the condition of these isolated dwellers on the sides and near the summit of the ranges which constitute the backbone of the continent. Their cabins are commodious, warm and comfortable, and are generally situated at or near tunnel workings, which afford them easy and safe access to the scenes of their day and night shifts of toil. These drifts are used as store-houses for provisions of all kinds, and while some are natural ice-houses others are temperate enough for articles that would be injured by freezing.

The experienced, prudent miner locates his claim in the timber, which tempers the furious windstorms and also protects him from the dangers of the dreaded snow-slides. If the situation is above timber line, he chooses a flat spot, above which the mountains are not high enough to hold snow-banks to break away and sweep down upon him, or plants his stout cabin beneath a sheltering ridge of solid rock in place or upon a "hog-back," which is the sharp divide between two gulches, and upon which both the winds and the contour of the ground prevent snow from accumulating. Granting that he has safely secured to him, what are the remaining conditions of his months of imprisonment? The natural tastes and domestic instincts of the individual are the gauges of his preparation for thorough enjoyment or mere toleration of his voluntary exile, and hence the habits and customs, the pleasures and amusements, and the modes of living are as variable as among the same class of individuals wintering in towns and cities.

But, as a rule, the menu is excellent, thanks to the canning of fruits, vegetables and meats, and all kinds of preserves and relishes. Intellectual pabulum can be made as diversified as in lower altitudes, with the one exception of daily newspapers. Those possessing musical tastes and accomplishments provide generously for enlivening the hours between labor and rest. The convivial soul takes good care that the flowing bowl does not become exhausted ere the snow melts from the trails, or that the tobacco plug and punch are ample for himself and all chance visitors. Water is obtained by melting the snow, and supplies of wood are previously prepared.

The miners, from their cosy cabins, are the observers of the terrific battles of the elements, and not infrequently witness nature's most awe-inspiring throes, commonly termed snow-slides. The snowfall amounts to from three to ten feet in depth on the level, and this is banked by the winds in drifts hundreds of feet in height, covering hundreds and thousands of acres in extent, according to the lay of the land, and when they become top-heavy, or the lower supports give way by melting or settling, the whole mass plunges down the steep mountain sides, uprooting, overturning and crumbling all obstacles in its pathway, until its force is spent in the valley below or against the opposite side. It is impossible to conceive the enormity of the power of a huge snow-slide until one follows in its wake down a mountain, where it has cut a huge swath through a heavy forest, hurled from their base gigantic boulders, scooped out the channel of a frozen river, and deposited the entire debris in solid mass far up upon the opposite bank of the canyon.

Miners have become expert in detecting the location and direction of impending slides, and are thus enabled to avoid them. They, however, become reckless or careless in estimating the time of their occurrence, and by passing over the field they expect to see move later on, they are engulfed in its sudden breaking away, and are hurried to a death they might have escaped by the exercise of more patience. The web and Norwegian shoes enable the practical operator to climb the mountains and swiftly descend them to the settlements for mail or any necessities of life which have not been previously supplied. The writer has often been surprised most agreeably at the preparations for comfortable, and even luxurious, living by men thus snow-bound in the mountains in different parts of the State, and in only a few instances has noticed any scarcity or lack of variety in the essentials of either comfort or rational enjoyment.

The Utah Smelter Bill.

H. F. No. 70. Territory of Utah, Twenty-sixth Session. In the House of Representatives, March 3, 1884, the Committee on Public Health introduced the following:

A Bill Regulating the Building and Operating of Smelters in the Territory of Utah.

SECTION 1. Be it enacted by the Governor and Legislative Assembly of the Territory of Utah: That hereafter no person, firm or corporation shall erect and operate any smelting furnaces in or within the quarantine limits of any incorporated city without the permission of the authorities thereof, nor near any agricultural or grazing districts in this Territory, without building or operating in connection with said smelters good and sufficient condensing chambers, with the required amount of superficial surface to prevent the escape of lead and other poisonous substances in such quantities as would prove injurious to the health and property of the inhabitants in the vicinity.

SEC. 2. All persons aggrieved and injured by

the non-compliance with the first section of this Act may, upon proper showing before any competent Court, recover damages to the extent of their losses or injuries, from the agents, operators or owners of such works, and also a writ of injunction restraining such persons from operating until they have complied with the provisions of the first section of this Act.

SEC. 3. All persons violating the provisions of the first section of this Act shall be deemed guilty of a misdemeanor.

Working the Mount Cory Ore.

The ore, after being brought from the mine on ore wagons, a distance of about eight miles, is dumped at the first rock breaker, passing through this pair of monster jaws is conveyed by cars to the tryere, from where, after being mixed with salt it is passed through another rock breaker, and from this is passed through a set of three Cornish rollers, the last one rendering it fine enough for roasting; from the rollers it is carried by an elevator to a chute, and from the chute to the furnaces, where it is roasted. After this process, it is spread on a floor to cool; being sufficiently cooled, it is carried by cars to the vats where it is leached for its silver.

The ore contains silver and some gold, together with copper, lead, antimony, arsenic and zinc. The silver in the ore is by the process of roasting converted into a chloride; part of the copper into chloride and sub-chloride; the lead into sulphate of chloride; the zinc is reduced to oxide and partly to volatile chloride, and the iron remains principally as an oxide and a small part as a chloride—in this condition the ore is put into the leaching vats of which there are twenty-four, holding about ten tons each—while in this condition, the ore is first leached with water to dissolve out all the base chlorides, together with the salt remaining in a soluble state in the ore.

Chloride of silver is insoluble in water, but the solution of salt and base metal chloride have formed will dissolve silver to a considerable extent. To recover the silver from this water Mr. Arents collects the water as it runs from the leaching vats, in large precipitating tanks in which cement copper is placed; this copper will take up the chlorine from the silver and go into solution, and metallic silver will be deposited on the copper. This solution has then given up all the silver to the copper and it is allowed to run off through the water-pipe. After the ore in the leaching vats has been leached with water until everything soluble in water has been extracted, it is then leached with a solution of hyposulphite of soda for its silver. This operation will take from two to three days before all the silver is extracted. The hyposulphite solution as it filters through the ore, flows into precipitating vats, where the silver is precipitated with sulphide of calcium as sulphide of silver and the solution of hyposulphite freed of its silver, is pumped up to a storage tank to be used again as wanted.

The residuum—a kind of black slum—is then ready to be converted into bullion, and as the mine is turning out ore in unlimited quantities, and of number one quality, and the mill working like a charm, we do not see any reason why this should not be a large bullion producing camp, and have a boom in the near future that will put *Cœur d'Alene* or any other camp in the shade.

SUPERFICIES OF THE OCEANS OF THE WORLD.—From a work by Dr. Otto Krummel, of Göttingen, we learn the extent of the different seas on our globe. According to his calculations, the Atlantic ocean has a superficies of 49,429,468 square miles; Indian ocean, 45,462,040 square miles; Pacific ocean, 99,897,917 square miles. Thus the total superficies of the three large oceans is 194,787,425 square miles. The Arctic ocean has a superficies of 9,481,294 square miles. In the Arctic ocean, Hudson's bay has a superficies of 663,249 square miles, and the White sea, 7,715 square miles; the Australian sea, 5,112,491 square miles; Mediterranean sea, 1,789,029 square miles; Baltic, 257,559 square miles; Red sea, 278,944 square miles; Persian gulf, 146,837 square miles. Then come the seas that Dr. Krummel calls coast seas, viz.: North sea, 339,526 square miles; Sea of Great Britain, 126,200 square miles; Sea of St. Laurent, 170,109 square miles; China sea, 761,632 square miles; Japan sea, 647,170 square miles; Sea of Okhotsk, 934,717 square miles; Behring sea, 1,440,338 square miles; Sea of California, 103,678 square miles. The total superficies of these coastal seas is 5,423,460 square miles. Adding the Antarctic ocean, the superficies of which is calculated at 12,606,236 square miles, the total superficies of all the seas is 231,915,905 square miles, while the total superficies of the continents and islands of the globe is only 34,354,950 square miles.—*English Mechanic*.

ARTIFICIAL OYSTERS.—Artificial eggs are beginning to be quite well known in the market in some portions of the country, but now it seems that artificial oysters are the latest things in deception, and numbers of "manufactured bi-valves" are said to be passed off on the Paris public. Hitherto, although the oyster itself could be well imitated, it had been found impossible to make the substance adhere to the shell like nature, but an ingenious personage has invented a glue which overcomes all such difficulty. The exact composition of the imitation is not stated, but copper is a prominent ingredient.

Electricity in Mines and Mills.

The Mount Cory reduction works, at Mount Cory District, Nevada, are now in full operation. About 1,000 tons of ore are on hand, and notwithstanding the icy condition of the roads, the teams are kept constantly at work. Everything, to the most minute detail, is exactly as was contemplated in the beginning. No breaks have occurred; no stoppages have delayed the steady advance toward completion. When the immense size and complicated character of the whole mill is considered, it will seem a matter of wonder that everything could be made to fit and work so perfectly. A feature in the crushing of the ore as described by the *Walker Lake Bulletin*, or the *Esmeralda Herald*—we are not sure which—is the electro-magnet in the ore chute over the rolls. As small pieces of pick-points and chips from the edges of shovels might be run through the rolls, it was thought best to prevent any possibility of resultant damages by placing a powerful magnet in the chute. A six-horse power dynamo machine is connected with the magnet, and gives it power sufficient to draw to it and hold any iron or steel which might otherwise get into the rolls.

According to *Engineering*, Messrs. Siemens and Halske, the well known German electricians, have recently applied the dynamo to the ventilation of the Carola pits, in Saxony. Two dynamos of the Siemens No. D 8 type were employed, one being on the pit head, the other coupled to the ventilating fan underground. The armature of the first dynamo is connected direct to the crank-shaft of the driving motor—a Dolgorki rotary piston steam engine giving an available work of two and one-half horse power, with an effective boiler pressure of three and one-half atmospheres. The conductor carrying the two machines is carried about 2,500 feet, and consists of a copper wire 0.28 inches in diameter, supported on stoneware insulators along the shaft. The return conductor for part of the way is an old steel wire pit rope, 1.18 inches in diameter, and for the other part a conductor of copper similar to the lead conductor. The second dynamo drives the ventilating fan by a strap, the shaft of the former making 124 revolutions to 100 of the latter. The ventilator is a centrifugal fan, made by G. Schiele & Co., about three feet three inches in diameter. The loss of power by the circuit one way and another is about forty-six per cent. The cost of working is 6s. 3d. per day, or about 3d. per million cubic feet of air delivered.

Asphaltum.

Domestic Asphaltum.

Asphaltum is mined to a small extent in California, has been found in West Virginia (gramamite), and recently has been reported in Colorado; but the production in this country has hitherto been very limited. About 3,000 tons of domestic asphaltum are used in California annually. Most of this comes from Santa Barbara county, from deposits near the coast, and this is said to be the best material, as it is the hardest and does not shrink. Some asphaltum is also shipped from San Luis Obispo county, and some from Santa Clara county. It is used for sidewalks and for street pavement, and also for coating water pipes. Some 18 miles of the 26-inch pipe of the Spring Valley Water Company, which supplies San Francisco with water, is coated with this substance. The asphaltum costs \$3 to \$4 per ton at the coast landings where produced, and \$8 to \$10 per ton in San Francisco.

Foreign Asphaltum and Asphalt Rock.

The asphaltum used in the Eastern States is almost exclusively imported, and comes mainly from the pitch lake at La Brea, in the island of Trinidad. The price is about \$14 per ton on the Atlantic seaboard. The use of the Trinidad asphaltum is increasing, some 10,000 gross tons of the crude substance having been used in the city of Washington alone, in paving the streets. In preparing it for paving, the asphaltum is tempered with heavy petroleum and mixed with sand and powdered limestone, thus imitating the natural asphalt rock. Messrs. Louis Monjo & Co., of New York, report an importation of Cuban asphaltum of 650 tons in 1882, the price ranging from 13 cents per pound up. There is a considerable importation of rock asphalt from Switzerland, one prominent locality being the Val de Travers, canton of Neuchâtel. This rock is manufactured into a mastic known as rock asphalt mastic, which is used for laying the wearing surfaces of sidewalks, roofs and floors. With the crude rock asphalt the wearing surfaces of carriageways are prepared. This crude rock asphalt is a carbonate of lime, naturally and evenly impregnated with bitumen. It sells for \$18 per ton of 2,000 pounds; and the manufactured mastic at \$23 per ton. The importations of foreign asphaltum during the fiscal year 1882 amounted to 30,686,333 pounds, invoiced at \$103,152. Crude asphaltum and bitumen are on the free list. The exports of asphaltum during the period mentioned amounted to only 8400.

The extensive Shasta River canal, owned by the Yreka Creek Gold Mining Company, has been purchased by E. B. Edson, who will extend it around the west side of Yreka, as formerly, if the Hawkinsville miners will make him a good proposition to that effect.

ENGINEERING NOTES.

The Advantages of Light Draught for Vessels.

Some years ago, standing on a point in the Bay of Fundy, we saw an Indian paddle a birch canoe up against a fierce rush of the tide, which no six men could have stemmed with an ordinary row boat, but the Indian shot up with ease, because his birch went over the water and scarcely at all through it. The fact was suggestive.

When we speak of light draught we refer to vessels whose breadth of beam shall equal nearly three fourths of their length, with this breadth carried well forward and aft. The power of a heavy sea to strain, twist or crush a ship depends absolutely on the power which that sea exerts upon her by reason of resistance which it meets when it strikes her. The deeper she is buried in the water the more this resistance is increased. The fury of the rushing surface movement is driven violently against her hull, which is held by the relatively less fiercely impelled water of which her deep draught takes hold. This lower stratum, though itself tossed by the storm, is less moved than that above, and it is to just that extent a solid body against which she is forced, and resultantly the less her draught the less there is of resistance and the less of strain.

Another item is the increased stability of the craft consequent on the increased breadth of beam. In passenger-carrying vessels this is a matter of no small moment. But, independently of this, a saving of motion is also a saving of wear and tear upon the vessel's frame; and if she is a sailing craft, increased stability gives in addition increased power of carrying sail with safety, and less liability to suffer from violence of wind or sudden changes.

The question of speed is for future consideration. But all these points, which pertain to the vessel herself, are of very small consequence compared to the advantages to be derived from her shallow draught by reason of the facilities for navigation which will be caused by it. Harbors in almost endless numbers will become available for active commercial service, which are now relegated to dependence on small and poor coasters, and imperfectly served at that. As all the world knows, the characteristic of all our Eastern coast, south of Cape Cod, is shallow water; scarcely a port can be found to which our largest vessels can have free access at all times of the tide, and into by far the greater majority large ships cannot enter at all.

If now we can devise any means by which ships of such size as the exigencies of modern commerce demand can be so constructed as to draw a relatively small amount of water and yet be just as thorough craft as now, as ready to keep the open sea, the world over, a ship of 3,000 tons, for instance, to draw but six or seven feet, we shall have opened a new and wide range for commerce and navigation.

Foreign Engineering Enterprises.

There are several large engineering projects at present on the tapis in Europe. There is plenty of capital, and the bridge between contemplation and realization may be passed over or not, according to the energy of speculators and the trust of investors. From our foreign exchanges we find the following large projects discussed:

A new examination committee has been formed for cutting a canal between the ocean and the Mediterranean.

This project has come up at various times, and would practically do away with the long, and, according to the song, "rough passage," through the Bay of Biscay, would deprive Gibraltar of its importance, and would open up a new route for the Mediterranean. The great objection to this canal, which would run from near Bordeaux to Narbonne, would be the large number of locks required.

The plans for forming the connection between the Scheldt and the Meuse are no fewer than three: 1st, via Hasselt, Quadmechelen and Herenthals; 2d, via Hasselt, Bolderberg, Diest and the Ruppel canal; 3d, along the valleys of the Paer, Herck and Demer. The second scheme is the one, however, favored by the author.

There still remains immense canal work to be done in Europe. The glorious Rhine has actually no sea outlet, and good as the Dutch are at "dams," they have never been able to regulate the Waal, or known what became of the Rhine. The Elbe canal will also be a great work, although it may be retarded by political complications in Prussia. A committee of engineers has been appointed for reporting on the removal of the obstructions of the Iron Gate on the Danube. In fact there is no absolute impediment to Vienna becoming one day a great port.

In England nothing is doing in the way of canal cutting, although the Manchester canal project crops up periodically. While practically possible, it may be doubted whether the extra expense involved in transshipping cotton (and this would be the only freight almost) from Liverpool to Manchester would not be counterbalanced by the lesser tonnage of vessels and by the disturbance of existing commercial relations. It is not the river, but the tide, that saves Liverpool, and the Mersey beyond Runcorn does not amount to much.—*Engineering News.*

USEFUL INFORMATION

The Protective Action of Tin Upon Iron.

This question has considerable scientific interest. It is well known that two dissimilar metals in contact with each other, in the presence of an exciting liquid, will form a galvanic couple, the conditions of the galvanic battery being thus practically established. Under these circumstances, precisely as in the galvanic battery, the electro-positive metal of the combination will be dissolved (corroded, oxidized), while the electro-negative metal will remain unaffected, and, when thus coupled, the solvent or corrosive action of the liquid upon the electro-positive metal will be more energetic and rapid than when it is exposed alone to its action. The energy of the galvanic action set up by two metals thus coupled, will be governed by their relative electro-chemical characters. For instance, between two metals standing near to each other in the electro-chemical series, the galvanic action will be exceedingly feeble; but this will progressively increase as they recede from each other in the electro-chemical series.

Applying these facts to the case of tin and iron, it will appear that they stand, relatively, considerably apart, and their union under the proper conditions will provide the elements for a galvanic current of some intensity. In such a combination tin is the electro-negative element, and is therefore protected, and iron is the electro-positive element, and is therefore the metal which is chemically acted upon by the electrolyte or fluid excitant.

When exposed to atmospheric moisture, which will play the role of an electrolyte, tin-coated iron must be perfectly coated with tin in order that it shall not suffer rapid deterioration. These facts are fully known, and the manufacturers spare no care and attention to coat their iron so perfectly that it shall be without a flaw. Wherever such a flaw exists, or wherever moisture can find its way between the two metals, galvanic action is at once set up, and the points in question become the foci from which the oxidation of the iron extends in all directions, like the continually widening circles made by a stone cast into a pool of water.

So long, however, as the tin coating remains intact, the tin, by reason of its presence and its indifference to atmospheric influences, effectually protects the underlying iron; but it should not be forgotten that as soon as the continuity of the tin coating is destroyed, the rusting of the iron, when exposed to moisture, proceeds with greater activity than if it were uncovered. Where, however, the tin coating has been removed for a considerable space by the oxidation of the underlying iron, the exposed surfaces of the latter metal behave to all intents and purposes as though the tin were absent, since it is only at the points of contact of the two metals that the galvanic action is maintained.

The above remarks will serve to explain why tin-coated vessels, or sheets, exposed to the damp or allowed to remain wet for a comparatively short time, are rapidly eaten through by the rusting of the iron; and also why it is important to completely dry such vessels at once after using them, or to protect with a coating of paint or varnish tin-coated sheets—tin-coated roofs, for example—that are to be exposed to the weather.—*Manufacturer and Builder.*

WHY COCHINEAL AND CARMINE ARE SO COSTLY.—The London *Ironmonger* explains why the beautiful cochineal and carmine colors are so expensive. It says: "One of the best and most powerful animal dyes used in the arts and manufactures is the body of the female cochineal insect, dried. This insect exists on a species of cactus, and when alive is about the size of a lady-bug, or perhaps a trifle smaller. It is wingless, rather long, equally broad all over, and is marked behind with deep incisions and wrinkles. It has six feet, which, curiously enough, are only of use directly after birth, and secrete itself to the plant by means of a trunk, which is found between the forefeet, and derives its nourishment from the sap. The male cochineal is like the female only during the larval period. It changes into chrysalis, and eventually appears as a red fly. The female deposits some thousands of eggs, which she protects under her body until they are hatched, and on the appearance of the young ones the parent dies. When the young are in the larva state their sex cannot be determined. They lose their skin several times, and while the female fixes herself on the plant, the male, after getting over the pupa state, is winged. Two or three months is the extent of the life of these little insects. They are gathered before they lay eggs, and are then rich in coloring matter. Carmine is prepared from the cochineal insect—*Coccus cacti*—which is collected by brushing the branches of the cactus with the tail of a squirrel or other animal. This is very tedious work. They are killed by being immersed in boiling water.

OBSCURING GLASS.—There are many ways of accomplishing this, some of the plans making the glass permanently frosted, others temporarily so. For permanence, take a flat piece of marble, dip it into glass-cutters' sharp sand,

moistened with water; rub over the glass, dipping frequently in sand and water. If the frosting is required very fine, finish off with emery and water. As a temporary frosting for windows, mix together a strong, hot solution of Epsom salts and a clear solution of gum arabic; apply warm. Or use a strong solution of sulphate of soda, warm, and when cool wash with gum water. Or dab the glass with a lump of glaziers' putty, carefully and uniformly, until the surface is equally covered. This is an excellent imitation of ground glass, and is not disturbed by rain or damp.

A NEW CEMENT.—Ordinary hydraulic cement is said to be greatly excelled in value as a mortar and in power of resistance to the action of water by a French mineral composition which has been brought forward, and for which are also claimed the advantages of being unaffected by air or acids, and of acquiring a stony hardness of 230, retaining this even in boiling water. This article is prepared by subjecting a mixture of 19 pounds of sulphur and 42 pounds of pulverized stoneware and glass to a gentle heat sufficient to melt the sulphur, and stirring it until a perfectly homogeneous mass is formed, when it is run into vessels and allowed to cool. The material thus produced melts at about 218°, and can, like asphaltum, be repeatedly used by heating it gently.—*Manufacturers' Gazette.*

AN ARTIFICIAL LEATHER. says the *Engineering*, mixed with five to ten per cent of sinew and pressed into sheets like ordinary leather cardboard, has been recently made in Germany. Both materials are made separately. The leather pieces are washed, cut, boiled in alkaline lye, torn, neutralized with hydrochloric acid, and finally carefully washed once more to remove all traces of acid. The sinews are treated similarly, but steamed in an acid bath until they are like glue. When thus prepared the materials are mixed, pressed into sheets, moistened on both sides with a concentrated solution of alum, and the upper surface is at last given a thin coat of caoutchouc in solution with carbon bisulphide.

PRICES OF HORNS FOR CUTLERY.—Reindeer horns are brought from Lapland and Siberia to England for use by cutlers in large quantities. The largest stag horns come from the East Indies and China. Many specimens of the antlers are so noble and beautiful that it causes a pang to see them given to the saw of the enter, the more so because they are becoming annually more scarce. The best are now selling for \$600 per ton. Time was when they could be bought for \$50 to \$100.

GOOD HEALTH.

The Spinal Cord.

Professor J. O. Hirschfelder delivered the fifth in the regular course of the Lane Popular Lectures at the Cooper Medical College, the subject of the lecture being "The Spinal Cord."

In considering the nervous system and its importance as the organ of mind, the doctor compared it to a telegraphic apparatus, the two systems independent, but united, the sympathetic or vegetative controlling the functions of life, and the cerebro-spinal or animal controlling sensation and volition. Pursuing the electrical analogy, the nerve cells are like the jar of the battery and the fibres like the wires, but he cautioned against confounding the nature of nerve force with that of electricity. An irritated nerve sends the effects of its irritation quite to the end of the nerve, as for example, a blow on the large nerve near the surface of the elbow will make the finger tips tingle, and when the nose is cut off and the surgeon's art makes another nose out of the skin of the forehead, a touch upon the new nose will for a long time seem like a touch upon the forehead to the patient until the brain has become accustomed to the new conditions. The

Composition of the Nerve Cell

Dr. Hirschfelder explained to be a coating of protoplasm inclosing a nucleus which in turn incloses a nucleolus. The protoplasm sends out arms that branch and re-branch and interlace, forming an intricate network, but also sends out one unbranched arm called the axis cylinder, which as it proceeds becomes inclosed in a coating called myelone, and re-inclosed in a sort of cement which gathers many nerves into one bundle. The nerve celled structure the doctor illustrated with a chart representing a multipolar nerve cell many times magnified. He illustrated the effects of nerve irritation upon the leg of frog with the nerve exposed in connection with the muscles of the leg. Pinching the nerve, touching it with electricity from the battery and with a wire heated in the flame of an alcohol lamp, produced the same effect of a spirited contraction of the muscles of the leg and foot, an effect known to science as isomeric transformation. The doctor described the spinal cord as a mass of nerve tissue, white and gray matter extending from the brain to the small of the back. It was fifteen inches long, as thick as a finger, and protected by scrum, called the cerebro-spinal fluid. A cross section, illustrated on the magnified chart, showed the central gray matter of the cord to be arranged like a somewhat irregular letter H. The white substance of the cord contains no cells, but

fibres that conduct nerves to different parts of the body. The course of the

Nerve Force

Through the vertebrae to the brain, and again from the brain to the muscle to be invigorated, both in the case of the sensory and motor nerves, was most clearly and interestingly shown on the chart. The super-sensitiveness of the finger-tips is due to the presence of corpuscles, the five-hundredth part of an inch broad and the one hundred and fiftieth part of an inch long, round which the nerves are spirally wound, thus giving more nerve surface to irritation. The union between the nerves of feeling and of motion is not far distant, so near as to cause the jerking away of the hand even before the brain has taken cognizance of the pin-prick or scorching about to injure it. This is called reflex action, briefly defined as the contraction of the appropriate muscle when a nerve of feeling is irritated, the contraction taking place without the command of the will. Again the frog, which the doctor called the long-suffering victim of science, because of the endurance of his tissues, was brought to the fore to illustrate the mechanical workings of the muscles after connection between the spinal cord and the brain has ceased. "If you stroke a normal frog," said the doctor, "sometimes he will croak and sometimes he won't, for the will cannot inhibit reflex action. I have severed the connection between this frog's brain and spinal cord and he will croak every time I stroke him." So saying, he took a fine frog from a retort, properly caressed him, and the audience applauded the resulting song. Skelton men in shows, the doctor said, were victims of disease in the cells of the gray matter of the spinal cord, which cause their flesh and muscles to waste away. The lecture closed by a comparison of the brain working on by force of will, though the nerve centres sent in protests of uneasiness, to a monarch ruling by oppression a groaning people. The riot and rebellion which inevitably follow dethrone the monarch himself as well as wreck the kingdom.

THE USE OF LEMONS.—The lemon tree is a native of Asia, although it is cultivated in Italy, Portugal and in the south of France.

In Europe, however, it seldom exceeds the dimensions of the smallest tree, while in its native state it grows to over 60 feet in height. Every part of this tree is valuable in medicine, though we rarely employ any but its fruit—that is, the lemon itself. And every one knows how to employ this in lemonade—to squeeze the juice into cold water; this is the shortest way—or to cut in slices and then boil it. Either way is good. Lemonade is one of the best and safest drinks for any person, whether in health or not. It is suitable to all stomach diseases, is excellent in sickness—in cases of jaundice, gravel and liver complaints. The pippins crushed may also be mixed with water and sugar, and be used as a drink. Lemon juice is the best scorbutic remedy known. It not only cures this disease, but prevents it. Sailors make a daily use of it for that purpose. I advise every one to rub their gums daily with lemon juice to keep them in health. The hands and nails are also kept clean, white, soft and supple by the daily use of lemon instead of soap. It also prevents chilblains. Lemon is used in intermittent fevers, mixed with strong, hot black coffee without sugar. In fact, its uses are manifold, and the more we employ it, externally and internally, the better we shall find ourselves. Natural remedies are the best and nature is our best doctor, if we would only listen to it. Decidedly rub your hands, head and gums with lemon, and drink lemonade in preference to all other liquids.—*The Shakers' Manifesto.*

WHY THEIR TOES WEAR OFF.—A man who has a "canting-toe-to-the-right-and-left sort of walk," during the contact of the foot with the ground, gives it a twist or grinding motion, the obvious result of which would be to wear off his boots rapidly at the parts where the most pressure is exerted. We have seen people who, in walking, give the body a quick, nervous thrust forward just about the time the foot is raised, while the toe rests upon the ground. This peculiarity tends to wear off the leather at the toe rapidly. Many people strike the point of the heel first in walking, and soon run it down through the hard leather lifts.

HOW TO RETARD OLD AGE.—"To sum up shortly what has already been advanced, according to the teachings of modern science the most rational and certain means of retarding old age are by avoiding all foods rich in the earth salts, and by taking daily two or three tumblerfuls of distilled water with about ten to fifteen drops of diluted phosphoric acid in each glassful. Thus are the mineral salts held in solution, and their excretions daily effected. The means herein advocated have also another great advantage—viz: That they cannot possibly do any harm.

TO SLEEP IN CLOTHES worn through the day is a bad practice. The clothes are filled with the effluvia emanating from the natural wastes from the body all through the day. Especially is this the case with those who labor hard, or perspire easily. The poisons of the system thus ejected or thrown off by people in vigorous health furnish a strong reason, if there were no other, for removing or retiring every article worn through the day.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—Amador Ledger, March 15: The second cleanup of the Talisman mill, running on ore from this mine, was made early this week. For 20 days, run, with ten stamps, on the general run of rock as taken from the mine, without any picking, the yield was 25 pounds of bullion, worth \$6,400. About 300 tons of ore was crushed, so that the average yield was a trifle over \$21 per ton, without sulphurets. This second demonstration of the value of this mine will doubtless spur the owners to put the property in good trim for future working. The mine is being well handled under the able superintendency of John R. Tregloan. Francis Ivers, of Boston, one of the leading stockholders in the South Spring Hill mine is visiting Amador county. He has been sent out by the stockowners to make a personal inspection of the mine, and see what has been done, what is in sight, and ascertain what is needed for the proper development of the property. We understand he is well satisfied with the prospects of the mine, and that the reports which have been made concerning its value are within the truth. It is probable that heavier hoisting machinery will be secured before long, which is greatly needed. The addition of ten stamps to the mill is also a work that will be needed at no distant day. It is a well established fact that ten stamps involve almost as much cost in running expenses as twenty stamps. At any rate, the difference in the cost is altogether out of proportion to the difference in the amount of ore crushed. So that wherever the size of the ore body is sufficient to keep 20 stamps going, it is the path of wisdom and economy to secure a mill of that capacity as soon as possible.

MISCELLANEOUS.—The Bunker Hill is running the 40-stamp mill to its full capacity. A cleanup was made a few days ago, which turned out splendidly. The sinking operations at the Keystone have attained a depth of 1220 ft on the incline. It is the intention to go about 100 ft deeper, and then to open up a level. A bunch of ore was encountered between the granite walls in sinking, of good quality. It was not followed. Since the heavy rains the pumps have been kept busy to control the water, between 200,000 and 300,000 gallons being pumped out daily. The water comes from the surface. Only twice in the history of the mine under its present management has the flow of water been so great as during the past week. Repairing the south shaft of the Governor is progressing. The big tunnel at Middle Bar is now in 700 ft, in soft rock, and progressing satisfactorily. There is a strong body of water flowing through the tunnel. The upper tunnel lacks only 20 ft of being underneath the shaft. It will take from a month to six weeks to make a connection.

SUTTER CREEK.—Cor. Amador Ledger, March 15: James Morgan has been in town the last few days arranging the Mahoney and Wildman mines for operation. The Lincoln is crosscutting on the 200-foot level for the lost ledge, and in all probability will encounter the same at no distant day. The little pick is once more in requisition in the Iowa, and the sound of the stamps will soon brighten up the intellects of the interested.

PLYMOUTH.—Cor. Amador Ledger, March 15: A new ore chute has been struck in the No. 3 north tunnel of the Pacific mine, nearly 100 ft inside of the Empire lines. It is 6 ft wide and opening out. It is good milling rock. This new chute of ore will increase the value of the Empire stock. A prospect tunnel, I am told, is being run south at No. 2 station. A crosscut has been run over 130 ft west to a foot-wall, and now the company intend to run south along this wall in hopes of finding an ore chute on this side of the shaft. If a new ore body is found of paying quality, there will be a big boom in mining matters here, as there are some adjacent mines which there would not be much trouble in disposing of to mining speculators. The present ore body that has produced so much bullion is enough to last five years or more without exploring or sinking for more. The Pacific is 1,400 ft deep, and rock still going down.

VOLCANO.—Cor. Amador Dispatch, March 15: Since I wrote to you last the business of this place has been on the mend. Owing to the last rains most all the gravel mines have started up, but the Tunnel Co. has been considerably damaged. Last Sunday morning their large flume that carries the south branch water to the creek across the tunnel broke down and caused the claim to fill with water and tailings so that they will have to build a new flume before they can commence operations again. It also carried away the water wheel and one side of Gillick's mill so that he is unable to crush any rock for the present. The Downs mine is getting out plenty of rich rock. The mill is running day and night to its utmost capacity. The Tellurium has started up under the management of Mr. Marrassia, formerly of the Gwin mine.

Calaveras.

NEW MILL.—Mountain Echo, March 15: The North End mine, situated about one mile west of this town, is now being worked by the company who recently purchased it. A new mill is in course of construction, consisting of two arastras, two stamps for dry crushing, and shaking tables for saving sulphurets. There is little doubt as to the mine paying, as the ore has been thoroughly tested, and proved to be rich.

VALLECITO MINES.—Monday last I had occasion to visit the Tyler mine, situated on Balaklava, about two miles east of town. I found the owners making preparations to wash an immense body of fine looking gravel which they recently extracted from the mine, and from which they expect to realize quite a handsome amount of the precious metal, as the gravel, on an average, has prospected exceedingly well. It is reported that Keiser & Co. have recently struck rich gravel in their mine. The owners have been engaged in running an incline, and at last, after running nearly 300 ft into the mountain, have struck gravel that will, most undoubtedly, prove this to be a good paying mine. Work on the Winchester mine has not yet been resumed as expected, probably owing to the illness of the Supt., Mr. E. Parsons. Mr. Robert Greenwell, of this place, has two men busily engaged in sinking a shaft on the Bunker Hill

mine. This mine has never been fully developed, and will, perhaps, prove to be a valuable placer mine. There are many quartz claims near here, but none developed sufficiently to give any idea of their value. The New Constitution mine, owned by Sloan & Co. is at present, idle. Work on this mine was suspended last winter, and it is not known when the company will resume work. As water has been abundant for the last week, several miners have been sluicing off the surface claims of Red Hill. I am informed the wash-ups were not satisfactory to the owners.

Inyo.

CARSON MINE.—Inyo Independent, March 14: This mine, situated about a quarter of a mile from the old Chrysopolis mill, we understand gives promise of developing into a fine property. The owners, Messrs. Conklin, Lasky, Anton and Bolinger, already have a shaft down 60 ft on the ledge. At the bottom of the shaft the ledge is five ft wide, and the ore is high grade. Work will soon be started on a tunnel to tap the ledge beneath the shaft, and then they intend to upraise on the ledge and make a connection with the shaft. It is estimated the length of the tunnel will be 200 ft. When completed the ore car can be loaded at the face of the tunnel, run into the mill and dumped into the hoppers without the least trouble, and thus save the expense of handling.

THE STORM.—The late storm has interfered with the mining interests of many districts in this county very materially. At Cerro Gordo the storm was so severe that work on the mines had to be suspended. The blacksmith shop at the Ygnacio mine was blown down and much damage done to other property. The snow on the summit prevents ingress or egress to Deep springs, Cottonwood creek, Beveridge and other districts, thereby stopping a great many mines from working, as no supplies can be got to the mines.

ACTIVE OPERATIONS.—John S. Gorman left here Thursday for Darwin, to meet Hon. P. Reddy, owner of the Defiance mine, and look at the recent rich strike made. We have it on what we consider good authority that active operations will be the result of their investigation, and if such be the fact, we look for large bullion shipments to follow.

SCHOOL CLOSED.—The Lone Pine school—Mr. and Mrs. Clark, teachers—closed for the term yesterday, with appropriate exercises. Supt. of Schools Charles H. Groves was present. Mr. and Mrs. Clark will shortly leave for Hawthorne, Nevada, to take charge of the public school at that place.

THE MAXIM COMPANY'S MINE.—This company's mine is now turning out ore equal to the average of the best mines in the State. The Supt. leaves this week to procure a stamp battery, everything else being in place.

FAVORABLE RETURNS.—Returns have been received from the February shipment of ore from the Brown Monster mine. They are very satisfactory—in fact, better than any previous shipment.

BEVERIDGE DISTRICT.—John Anton and M. C. Lasky, just in from Beveridge, give us the following information from that rich mining district: There are about forty men at work taking out ore in different parts of the district, and the late run of the Lasky mill shows that they are making good wages. The mill crushes lots of fifteen tons or over at \$10 per ton; anything less at \$12. This shuts out the arastras from working custom ores. McEvoy's mill is closed down for the present. The prospectors and mine owners are happy and content, for they can go to work on their claims any time and take out a grub stake, and in some instances make quite a pile of money in a short time. The snow on the summit is about four ft deep, making it difficult to get in or out just now.

Mono.

A GOOD TIME COMING.—Bodie Free Press, March 12: A practical man—not an "expert," but a miner—remarked yesterday that the coming summer would be one of the liveliest that Bodie has ever seen. He is firm in the belief that before the year is ended there will be continuous work from High Peak to Queen Bee Hill, and that there will be more comprehensive prospecting done than ever before. "There is," he said, "an endless amount of low-grade ore here that we know of. If this were economically worked there would at least be profit enough to pay the expense of prospecting for better ore. In other places they work, at a profit, poorer ore than we have. We have proved that we can do pretty close milling here, and when we get to working this low grade stuff on a large scale we will have a big camp."

BODIE.—Free Press, March 16: The week was ushered in by the most severe storms of the season, or for several seasons. A fall of over two ft of snow or nearly as much more, with which the ground was already covered, interfered materially with communication and transportation, and the Bodie mill lost two or three days' time in consequence. The weeks' bullion shipment will therefore be lessened in that proportion. The results of the works of exploration and development in the Bodie have been of a most satisfactory character. The stops at the 306 level are now over 100 ft in length in rich ore, while in the Vulcan vein on the 206 level a bonanza is being opened which is likely to rival if it does not exceed in value the old Bruce and Burgess bonanzas of 1878. In the upraise from the 433 level on the Fortuna ledge the vein is well defined, and some rich ore has been encountered, giving promise of a valuable development between that and the 306 level. Ore is also being extracted from the 550 and 770 levels. This latter is hoisted through the Lent shaft, where the ore bins are filled with rock awaiting shipment to the mills.

Nevada.

GOOD RESULTS FROM THE BANNER.—Foothill Tidings, March 15: Flattering reports were received last evening from the North Banner mine, and created quite a little ripple of enthusiasm among the stockholders in the prospect. The ledge in the main drift and the upper tunnel has improved greatly in the last two weeks, and the ore in the stopes is very good. J. M. Lakenan is now engaged in making five additional stamps for the North Banner, and they will be placed in the mill as soon as they are finished. The mill has five stamps in it at present, and they are kept running from seven o'clock in the morning until seven in the afternoon. A cleanup of the plates in front of the battery, for 48 hours run,

gave 48 ounces as a result, which is very good considering that the amalgamation is done in the battery. On Monday next Mr. Wm. A. Hawley, assistant amalgamator of the Idaho mine, will take the position of Supt. of the North Banner and Jonathan Rosevere will act as underground foreman. Both gentlemen are well qualified for the positions. The outlook for the North Banner is very encouraging. The Merrifield mine, located near Nevada City, was closed down to-day. It was but a short time since this mine was closed, and the shaft allowed to fill with water. While it was in that condition, some parties in New York purchased one-half of the mine and work was soon resumed, but only with a small force of men. The water has not been entirely pumped out since the close, and work was only done in a few of the levels. To-day the mine was closed for the second time, but it is quite likely that tributers will be put on as soon as they can be engaged. Messrs. Bourn and Stoddard, who have charge of the affairs at the North Star, are in San Francisco, but are expected here in a few days. The Imperial Company have commenced sinking their sump, and in a few days drifting will begin. About \$300 worth of pure gold was brought to town to-day by parties who mined it from the croppings of the Hartery mine. The Idaho Company are now running on the 15-level and have a large ledge.

BEAUTIFUL SPECIMENS.—Grass Valley Union, March 15: Yesterday, in the 300 level of the Magenta mine, the workmen encountered some of the richest rock ever taken out in this vicinity. The specimens are dark crystallized quartz, filled with beautiful bright wreath gold. As cabinet specimens they are as fine as ever were found. To-day they will commence taking up ledge in this same level of the mine, and no doubt it will prove very rich. The stockholders of the Magenta have every reason to be jubilant over the flattering prospects of the mine, and those who were lucky enough to purchase stock at 50 cents per share have reason to congratulate themselves upon their good fortune, as the Magenta is certain to soon be one of the leading mines in Grass Valley district.

Plumas.

LORING AND LEAVITT.—Greenville Bulletin, March 12: The cause of the drowning out of the Loring and Leavitt mine does not seem to be clearly understood. Several years ago a drain tunnel was run through the ground at a depth of thirty ft from the surface. This was to catch the surface water and carry it past the ground being worked. The timbers in this tunnel had rotted a good deal, and finally gave way and let the ground cave in. The shaft through which the ground is now worked is about thirty ft east from the tunnel, and is connected with it by an opening. When the tunnel caved in the water backed up, passed through the opening and poured down the shaft, which is 116 ft deep. It is not expected that much more mining will be done on the claim till a new shaft shall be sunk lower down the canyon. This had become necessary, as the ground above the shaft is already worked.

San Bernardino.

GOMBLER.—Calico-Print: There are now 13 men at work on this mine and considerable ore is taken out that will average \$75 or \$100 per ton. Occasionally small, rich pockets of ore are struck that would mill up in the thousands if taken separately. Operations of sinking below the present depth has been suspended for the present and work has been confined to simply taking out ore wherever it can be found in openings already made and in new places recently opened. Teams are supplied daily with ore from the company's mill a Hawley's and there are also 100 tons and over in the ore bin. The Eclipse mine, adjoining the Kearsage on the south, owned by Col. E. S. Basdel and others, recently milled two lots of ore at the Oriental mill that returned about \$500 each. A shaft has been sunk to a depth of about 30 ft and the appearance of the rock has not deteriorated in the least since they first struck ore, which was of a fair grade. Last week Nichols & Co., commenced work on the Tiger mine a short distance above the Garfield.

THE BONANZA KING MINE.—Calico-Print, March 15: Mr. Thos. Ewing, superintendent of the Bonanza King mine, of Providence, called at this office last week while on his way to San Francisco. From him we learned that the Bonanza King is looking splendidly and that recently some very rich developments have been made in some unexpected places in the mine. The lowest working is at a depth of 547 ft and the appearance of the ore at that depth is improving. A 12-foot vein of considerable richness has been discovered in the fourth level back of what was considered the foot wall of the ore zone. There is ore enough in sight, that will average \$100 to the ton, to keep the mine and mill in operation for the next four or five years. The recent hauling of ore to the mill difficult and disagreeable. The mill has been running regularly with the exception of a loss of three days last month in making a few repairs. The other new strikes recently made are still holding out well, and the general prospects of the camp are improving.

SPECIMENS OF ORE.—We have received from Mr. O. G. Leach, superintendent of the copper mines in Ord district, several fine specimens from those mines. A large ledge runs through several groups of mines in this district which at a depth of about 50 ft measures in some places ten or twelve ft in width. The ore averages about 35 per cent in copper, and there are apparently large bodies of this character of ore. Some rich pockets of ore will go as high as 75 per cent. There has been considerable work done on some of the mines, but at present but little is being accomplished.

BULLION FROM IBEX.—Last Wednesday Mr. M. Carey arrived from the Ibex mine with seven bars of silver bullion valued at \$12,840. One of the bars was a heavy one valued at \$2,300. On account of the ore becoming wet by the rains, it became necessary to close down the mill for a few days until it dried out, as the mill is a dry crusher.

LAVA BEDS.—Mr. J. W. Smith arrived in town from the Lava Beds on the 12 inst. He reports having purchased recently the Columbus mine of Messrs. Thos. Gray & Co. The Columbus is the first southeastern extension of the De Soto mine, and has a width of about forty ft in the croppings. The firm, J. W. Smith & Co., are now actively at work preparing to develop the mine, and as soon as a windlass arrives will put on a night and day force of

men. Mr. Smith speaks highly of the camp and says the mines show every indication of permanence. The De Soto is looking well and the workings have been carried to the depth of about 35 ft. Some six or eight tons of first-class ore is already on the dump and many more of second-class. The first-class ore is rated at about \$300 per ton in silver value. Mr. Smith is a miner lately arrived from Nevada, and as his experience in silver ores extends over a term of 20 years or more what he says in regard to the outlook and prospects of the camp can be relied upon. Without any ostentation he pronounces it a good camp, and one which will doubtless last for years.

Shasta.

GOLD.—Shasta Courier, March 15: The "wet weather" creek which runs through town and empties into Middle creek, has yielded considerable gold in times past, and on Main street, since the recent rains, about \$6 worth of gold was picked up. In the garden of F. Prehn, formerly the Harrell garden, placer diggings have been struck and considerable gold lately taken out. In the range of hills northeast from town, and extending from the head of Back street to Bunker Hill on Middle creek, gold is found, but no water is to be had to extract it as yet. Bunker Hill yielded "mule loads" of "oro" and in the hills a little east of that Gold Hill and Daniel's Hill panned out thousands. There are undiscovered bonanzas in this vicinity yet.

QUARTZ.—During the past year extraordinary activity has been shown in discovering, prospecting, locating and working quartz lodes in this county, and the result is that those representing quartz interests are full of courage and go ahead. The year 1884 will undoubtedly witness more activity in this class of mining than any two preceding years has done. The invention known as the Dyer Cannon Ball mill has greatly contributed to, and encouraged mining interests in the county, as they are not costly and do satisfactory work. Among the purchasers of these mills in the county are Thomas Greene, C. J. Kempton, St. Auburn & McKaig, Wm. Hall, Daniel O'Neal, Willard & Wiel, Wm. S. Coleman, Andy Cusick and several others.

Sierra.

PUSHING WORK.—Tribune, March 15: At the Sunnyside gravel claim, located near Poker Flat, the contractors will complete the 100 ft of main tunnel in a week or so. The Company expect to reach gravel in about 100 ft further and when the present contract is completed will immediately let another for that distance. The good work of developing our great mineral resources goes steadily on.

RED OAK.—Mountain Messenger, March 15: Johnny Mason was down from the Red Oak claim this week. He has struck a streak of very hard rock which costs about \$40 a foot to penetrate. The snow is about 20 ft deep at the mine and hard as a rock and full of water. Kendall & Co. have their cut up to the bank, and have struck an old tunnel run something near 20 years ago, but which being too high was abandoned. It shows that there is a back channel in the bank, and it is for that they are running.

LOCATED.—The quartz mine, formerly known as the Graphic, located about one and a half miles northeast of Plum Valley, has been located by Richard Dillon, David Davis, Thos. W. Jones, Gustave A. Deiter and J. M. Davis.

NEARLY READY.—Work was commenced to put on the belting at the new quartz mill of the Sierra Buttes Co., last Wednesday. The stamps to the number of 20 are in place, and Chief Amalgamator, J. Carney, is preparing the copper plates. There was some more work to do on the tramway, and the chances were favorable for crushing to begin some time next week.

COLOMBO.—The Colombo Quartz Mining Co., Sierra City, paid off their men Wednesday. Everything at the mine looks well for the future. The concentrators have been temporarily stopped as there are not enough sulphurets to run them. The Ruby Company is now employing about 60 men, and as there is plenty of water, there will doubtless be good returns before long. There was a cave in the air shaft at the Blue Gravel mine recently at Sierra City. The Bunker Hill boys are at work again after having lain idle since Christmas for want of air. A number of gravel mining locations have been recently made in the neighborhood of Tennessee ravine. A company of Portuguese are ground-slucing for quartz opposite Sierra City.

Tuolumne.

A FLOOD AT THE PATTERSON MINE.—Union Democrat, March 15: The Patterson mill and mine at Tuttletown suffered severely from the flood last week. The water poured in torrents off the hillside into the gulch where the tunnel is located, flooding the mine, tunnel, car track, blacksmithshop and office. A great portion of the dump was washed up against the mill, and much of it swept inside. The water flowed all through the mill, covering the floor with mud and slime. It became necessary to shut down the mill to clean it out, and repair damages. Everything has since been placed in working condition, and the mill has again resumed crushing.

THE MINING OUTLOOK.—Tuolumne Independent: There will be no lack of water for mining and milling purposes in this section; therefore, a renewed activity in quartz and other branches of mining throughout the county is looked for. Reduction works are now being placed on the Stockton mine, and the Oakland Company contemplate erecting a twenty-stamp mill on the Auburn mine at no distant day, and many new mines in this district are showing flattering prospects as the process of development progresses. Once the great mineral and other natural resources of the county are fairly developed and opened out to the commerce of the State, through ample railroad facilities, Tuolumne will be classed among the wealthiest counties in the State. Progress, in reaching this stage of commercial importance, will be slow and tedious; yet, the county has within its boundaries undeveloped wealth, which, in after years, will justify its title to such a place in the future history of the State.—R. O. Columbia, March 13, 1884. At the Patterson mine they are sinking the main shaft rapidly, working three men to the shift. The rock looks well, showing gold daily. The vein is very large, no hanging wall showing—which necessitates close timbering. The Patterson, generally, never looked so well before, or with a better prospect. The flood at Tuttletown did some damage at the Patterson mine, delaying operations some two days. The rush of debris down the gulch backed up at the tunnel, and came within an inch of going

into the shaft. Had it occurred in the night, it would have occasioned a loss of life in the mine. The dump was washed into the mill, and a bad mess made generally. The energetic Supt. has everything again in running order.

BEN SOULSBY MINE.—The Ben Soulsby mine, under Col. J. L. Coles, Supt., shut down a couple of weeks ago, but is going to start up again, and will employ several men. This mine has been in the hands of a great many different owners. It was discovered in the year 1857 by B. Soulsby. It was afterwards taken up and sold to a San Francisco co. by M. B. Duffield. It was then shut down, and laid idle for several years. It was then taken up and worked by Kaden and Soulsby. They crushed rock that paid between 60 and 70 dollars a ton, in an anartha. Coles then did some work on the mine, while owned by them, when it was again shut down. In 1880 it was jumped by Westinghouse, who sold out to Coles. It is now owned by parties who intend to work it as it should be worked. The rock and metal (or sulphurets) is the same in appearance as the old Soulsby mine, and it is supposed to be an extension of it. They have good hoisting works and pumps now on the mine. Adjoining this mine is a mine known as the "L. Soulsby mine." This mine will also start up under a company, as soon as the other is under good headway. There is a splendid rock in this mine, the ledge varying in width. In some places it is one and a half feet wide. The shaft is down fifty feet, and the ledge still continues to look fine.

NEVADA.

Washoe District.

GOULD AND CURRY.—*Enterprise*, March 15: At the 2700 level they have commenced cutting out a station from which to start a drift. A donkey pump will be set up and all put in good shape to handle any water that may be encountered before starting the drift.

ALTA.—Good headway is making in the main east crosscut on the 2150 level. The ground is now blasting tolerably well. In the main west drift on this level the ground is working well. It has yet some 200 ft. to go before reaching the west wall. Occasional streaks of quartz are cut that carry metal.

BEST AND BUTCHER are excavating the station at the 2700 level. A donkey pump will be set up at this station before starting the drift. The Osborn shaft has been overhauled and put in good shape, and a new compressed air pipe has been put in from the surface down to the Sutor tunnel level.

SIERRA NEVADA.—The northeast drift on the 3100 level is being advanced at the rate of about 20 ft per week. It is still in vein material, and is going with the course of the vein. On the 2900 level are making preparations to begin active prospecting operations.

SAVAGE.—The flow of water cut in the north drift on the 2600 level appears to be decreasing somewhat. In case it does not run out in due time this water may eventually be shut back by means of a bulkhead placed across the drift.

COS. VIRGINIA.—The enlarging of the station at the 2700 level has been completed, and the double hoisting engine is being set up at the top of the winze that extends down to the 2900 level.

UTAH.—The northeast drift on the 1750 level is being advanced at the rate of about twenty ft per week. It is now out about 360 ft. The face is in vein material, with occasional streaks of quartz carrying some metal.

BELCHER.—Sufficient ore to keep the mills on the Carson river in operation is being regularly extracted. The mills will be kept running to their full capacity all summer.

CALIFORNIA.—The work of enlarging the 2700 station is completed, and the double hoisting engine is being placed in position. Are still making some repairs to the C. and C. shaft.

YELLOW JACKET.—The usual amount of ore is being extracted from the old upper levels, and the mills on the Carson river are kept in operation to their full capacity.

OPHIR.—Are extracting low grade ore on the 150 and 250 levels. Prospecting drifts are being run on both levels. The ore found is principally in the old fills.

CROWN POINT.—The usual amount of low grade ore is being taken from the old upper levels, and the mills on the river kept running.

ANDES.—The drifts are showing quartz of a promising character, and the usual amount of low grade ore is being extracted.

UNION SHAFT.—Are still cleaning out and repairing the drain drift that runs out to the Sutor tunnel on the 1600 level.

IMPERIAL.—Are drifting north and south on the old 600 level, where some favorable prospects are being obtained.

SCORPION.—The usual progress is making in the west drift, and the material shows no special change.

Columbus District.

MOUNT DIABLO.—*True Fissure*, March 15: Winze No. 5 has been sunk eight ft during the week. Its total depth is 95 ft. The south crosscut from the west drift on the third level has been stopped for the present, after reaching a length of 125 ft, and the men have been put at work sinking the incline below the third level. The work in the remaining parts of the mine presents nothing noteworthy. The work of sinking the incline is progressing favorably, except in the upraise from the third to the second level, where the ground is hard. The total amount of incline driven thus far is 149 ft. Of this 52 ft were driven this week.

COLUMBUS CON.—Since the date of the last report the usual amount of work has been done on the different levels of the mine. A small quantity of good ore is being extracted from a streak that is in the drift. There is no work of importance being done in the east drift that was started some time since from the above mentioned crosscut. The east drift from the main drift on the third level has attained a length of about 20 ft, and a quantity of very rich ore is being extracted from it daily.

Eureka District.

BREIF LOCAL NOTES.—*Eureka Sentinel*, March 15: The Hamburg tributaries are still doing well. The Fair Play mine on Alhambra Hill, is a daisy.

The Mildred mine, Secret canyon, is a splendid prospect. Wm. McCuen reports his tribute pitch in the Connolly mine improving. The Diagonal mine at Silverado is producing some very good ore. The leasers of the Colorado mine are taking out a good quantity of fair ore. Large quantities of ore are coming in from the Silver Lick mine, Adams Hill. A new shaft will be sunk in the Original Butte mine by the Silver State Company. The Rescue mine at Silverado is producing some unusually good ore at present. The Uncle Sam Tunnel at Silverado is looking well and the ore coming from it is very rich. There are a number of tributaries at work in the Queen mine at Silverado, all making big wages. Tribute pitches will be let on the quartz ledges of the Central Hill mine as soon as the snow leaves. There is an accumulation of ore at the El Dorado No. 2 mine, which will be sent to the furnaces in a few days. When the roads and trails are all broken there will be a great rush of ore to the smelters to help the spring boom. The road up to the Alexandria mine has been cleared of snow, and ore will be shipped from there during the present week. Tom Werry of Ruby Hill will lease the Snug Harbor mine, on the line of Prospect Mountain Tunnel, on application. There is pay in sight. Work has been resumed on the Uncle Sam mine, at a point near New York canyon, where some very rich ore was found years ago. A great improvement has taken place in the Clipper mine. The fissure is widening and the ore in it is increasing in size and assay value. From the best sources we get information that there is more ore broken down in the small mines of this district, awaiting shipment to the furnaces, than was ever known before. An unusually large number of mines in Eureka and adjoining districts are being leased, and the number will increase as the spring season advances. This appears to be the only good that has arisen from the late depression, but it will very likely prove of lasting benefit to the camp. We have it upon reliable authority that a new and valuable strike has been made in the Home Ticket mine on the lowest level. The main shaft will be sunk deeper and a drift carried out under the newly discovered ore body in order to work it out to advantage. So says our informant. A gentleman who has had considerable experience in our mines has visited the Dead Broke mine and reports it as being in a very flattering condition. He says there is ore on the dump and in every opening in the mine. He saw rich galena in about 40 different places. This kind of ore in the Dead Broke mine will assay upwards of \$300 to the ton. The Silver Connor mine has been pretty well snowed in during the heavy winter storms, but the snow fall having abated, the dump has been cleaned off, and the work of hoisting ore will be resumed at once. If the present thaw continues the trail and road from the mine to Eureka will be shoveled out and the ore shipped to the furnace as quickly as possible.

Taylor District.

NEW WHIM.—*Virginia Enterprise*, March 15: The Monitor people are putting up a whim on their main shaft, which must prove a great saving of labor. Last summer they had to hoist their ore by windlass, and they paid \$4 a day to the men at the crank, as well as to all others in their employ.

Tuscarora District.

INDEPENDENCE.—*Times-Review*, March 13: West crosscut No. 2, 300 level, has been extended 15 ft. No. 2, drift north, same level, advanced 17 ft. Retimbering the main drift, north where it was required, has been completed.

CENTRAL CON.—South crosscut, 150 level, extended 8 ft, and discontinued for the present. North crosscut, 150 level, extended 28 ft. Upraise on 80 level to crosscut old workings, extended 19 ft.

ELKO CON.—The main west crosscut, 200 level has been discontinued for the present. Have commenced drifting north and south on ledge No. 2. It is looking quite favorable.

GRAND PRIZE.—South crosscut on north lateral, 200 level, extended 35 ft; no change in formation. South drift, 400 level, is in 365 ft. An upraise from this drift has been started on the vein which is carried up 19 ft. Vein looks favorable.

NAVAJO.—The pump station, at the 350 level has been completed. The pump is in place and the connections will be made within the next two days. The mill will be started, and work in the mine resumed at all points in a few days.

COLORADO.

GENERAL NOTES.—*Georgetown Conrier*, March 15: The Kitty Clyde mine is working forty men and considerable good ore is being taken out. Two and a half tons of ore from the Matilda Fletcher mined last week, run 123 ounces silver per ton. Three eight-hour shifts are sinking the Mendota shaft. The ore streak is five ft wide in places. An engine and hoisting machinery is soon to be placed on the Troy mine by the Union Manufacturing Co. The Mayflower mine, near Idaho, started up work on Monday under the management of Dan Kroken. It is probable that the Little Mattie will soon be started up also. While drifting the Pay Rock mine, Messrs. Criley and Williams, lessees, made a good strike on Last Friday. They opened up a streak of ore, 12 inches wide, which runs 600 ounces silver per ton. It is reported that a company under the title of the Grand Lake Mining and Smelting Co., has bought machinery for a mill at Gaskell, Grand county, which will be built during the coming summer. The Atlas mill, at Empire Station, started up on Monday last. Mr. Sol. Robeson, the manager, says that they don't expect to stop for six months, unless some breakage compels them. Two teams are hauling milling quartz from the California lode. A good strike was made by Moore, Farris & Co. in the Joe Reynolds mine last week. In sinking a shaft from the tunnel level, following a good vein of mineral, when at a depth of about 45 ft, a large body of solid mineral was opened up, which carries large quantities of gray copper and ruby silver. It is said by solid, substantial men who are acquainted with the plans to be pursued by those interested in properties in West Argentine district, that that section will be livelier this summer than ever before. Those working mines in the district last summer were so successful that they will extend and do greater work this year. Another reason assigned for the future activity is the fact that the railroad will be completed within three miles of the district. Mr. D. C. Folsom, who is interested in the Vermont lode, on Kelson mountain, returned from Boston and other eastern places, last week. He says that since he has been

gone he has visited a number of mining sections of Colorado, and can say without a doubt that Georgetown is as good a mining camp as there is in the Rocky Mountains. It is his opinion that the present outlook for Georgetown is the best for years. More interest, he says, is being taken in this particular camp by people outside the State and outside of this section than in any other in Colorado.

THE SEVEN-THIRTY.—The tunnel level east of the Seven-Thirty mine continues in a fine body of ore which appears to go both down and up, and offers good prospects in the levels above and below. The level above is being rapidly pushed ahead to the point where the ore chimney has been opened on the tunnel level. The last lot run from this ore body, on the 8th inst., assayed 129 ounces silver per ton second class, and 246 ounces silver with 40 per cent lead for the first class, and netted \$1,287 after deducting freight, mill charges, etc. The 240-foot, 330-foot and 375-foot levels east are being pushed out in the direction of the ore body opened on the tunnel level. Each of them show fine seams of mineral. Thirty-nine tons shipped from the 1st to the 8th inst. netted \$5,456, or an average of \$140 per ton after deducting smelting charges. Some lots carried from 15 to 50 per cent lead, and were worth from \$400 to \$700 net per ton.

ARIZONA.

AUBREY DISTRICT.—*Cor. Mohave Miner*: I believe that the developments and productions of our mines should be made to speak for themselves, instead of wasting time, money and breadth trying to sell prospects for prices that only well developed mines will bring. I am a firm believer in the future of Mohave county. When the time comes that owners of claims will go to work and mine practically to obtain the fruits of their labors from the output of their mines and not hold back for buyers to offer big prices for prospects, then Mohave county will begin to receive the attention its mineral resources deserve. Then the long-looked for boom will come, as capital always seeks investments where good returns can be had on a reasonable outlay. We have markets for our ores both at home and abroad and in my opinion there are hundreds of prospects in Mohave county that will produce enough good ore in the work of development to pay the expenses of the same. I have been in a dozen different districts in this county and I have the first one yet to see that has not only one but several fine prospects, the equal of which is not to be found in the territories. The developments as yet are hardly sufficient to attract the attention of heavy capitalists. The Wallapai range has an extraordinary showing. For length of well defined belts, strong ledges, contact formations, good character and quality of ores on the surface, its equal cannot be found and future developments will substantiate it. Inside of two years Mohave county will take its proper place in the estimation of the mining community, and labor will have its reward. I base my opinion on observation and tests of ores taken from the different districts, not taking anyone's say so regarding the quality of the ores, as I believe the furnace is a better test than either the eye or judgement. This part of the county is coming to the front, especially that portion called the Grooms Peak country by some and Tillman basin by others.

IDAHO.

MINING SALES.—*Ketchum Keystone*, March 16: C. P. Smith's interest in the Mattie mine on Trail creek, about six miles east of Ketchum, has been sold through Judge Lewis to Geo. M. Snow, the Banker. The Mattie has shown itself to be a very bright prospect in the possession, near the surface, of a compact vein of galena in a ledge of iron and low grade oxides. Some very fine specimens have been brought from the mine. The situation of the Mattie is very convenient and advantageous for immediate operation, and it is easily accessible. Mr. Snow is a gentleman of means, and we expect to see the property strike out for development in the coming season.

COEUR D'ALENE TOWNS.—Snow is three ft deep at Eagle City, Coeur d'Alene, and 11 ft deep on the mountains of the Belknap trail. The east immigration for May is estimated at 25,000. Four new towns are laid off in the country as follows: Butte creek, one-half mile below the Widow claim, crossing of Evolution trail and Pritchard creek, and at the mouth of Eagle creek.

BULLION SHIPMENT.—From the Vienna Company's mill, at Vienna, March 6th, 2 bars, Nos. 128 and 129; weight, 241 pounds; value, \$2,485. March 9th, 3 bars, Nos. 130, 131 and 132; weight, 350 pounds; value, \$3,699. March 8th, 3 bars, Nos. 133, 134 and 135; weight, 369 pounds; value, \$3,877.

MONTANA.

A STEADY DIVIDEND PAYER.—*Butte Inter-Mountain*, March 11: The Original mine is now the steadiest dividend payer in the western territories. The thirty-first consecutive monthly dividend of \$3,000 and making a total of \$93,000 was declared on the 1st inst. and has since been paid. The development of the mine proceeds as usual. On the 400 level, where for a time the ore body appeared broken up and where considerable prospecting was required in yielding an excellent quality of ore from a compact and well defined streak varying in width from one to two ft and sampling about \$500 per ton. The level also shows an abundance of second class ore assaying from \$40 to \$60 per ton. The Moulton looks fully as well as it has done at any time since the December strike was made. On the 400 level the new ore body is producing well from drifts and stopes. The sinking of the 400 foot winze has been suspended for some time on account of water. It showed a fine vein of ore of uniform quality all the way down. The main shaft of the Liquidator having been sunk to a depth of 300 ft, a crosscut has been extended to the vein. The walls were found intact and the ore body, though of somewhat low grade at the place of intersection, is as compact and wide as ever. Drifts have been started and a great improvement has taken place in the quality of the ore. The two mills are running smoothly. The Anaconda continues to be the heaviest producer in the territory, but no attempt is being made to crowd the production. The only ore now being extracted is taken out in the necessary work of advancing the drifts.

THE MOUNTAIN VIEW.—*Inter-Mountain*, March 12: The appearance of the Mountain View mine continues to improve. On the 500-foot north level

the east drift shows a handsome face of high grade copper ore. The south vein is being actively developed. The south crosscut from the 400-foot station has penetrated the ledge for a long distance, and opened up 20 ft of good concentrating ore, besides streaks of copper glance and pyrites. The hanging wall has not yet been reached. The south crosscut from the 300-foot station has not yet reached the foot wall, but is being driven vigorously ahead in that direction. The future of the Mountain View is assured, and it will soon rank as a producer with the leading copper properties of the Butte district.

THE DRUM LUMMON STRIKE.—*Cor. Butte Inter-Mountain*, March 12: Ere this, no doubt, you have been informed that the lower or Maskelyne tunnel has cut the Drum Lummon lode. To-day I had the pleasure of examining some of the ore taken from the late strike, and was surprised to find it of much finer quality than that found in the upper levels. Free gold and sulphides of silver could be seen with the unaided eye in that examined. The point at which this tunnel pierces the vein is 400 ft vertically below the outcrop, but as the vein dips southerly 70 degrees from the horizontal for 200 ft in depth then at a greater angle, it will be readily seen that the body of ore has a much greater height than 400 ft. The air drills have now been working about 48 hours, cutting across the bonanza, and no sign of hanging wall yet. The quartz samples \$64 50 per ton in gold and silver.

NEW MEXICO.

LAKE VALLEY.—*Rio Grande Republican*, March 11: Mining matters at Lake Valley continued to improve during the week just passed. Sierra Grande has come to the front with a shipment of high galena. In the meantime, the mill runs steadily on low grade ore, making handsome returns. The concentrators, under the immediate supervision of Dr. Taylor, are proving a success.

SIERRA APACHE.—Developments this week are encouraging. An occasional carload of high grade ore being the result of a very trifling expenditure by the company.

OREGON.

GENERAL NOTES.—*Jacksonville Times*, March 14: The Palmer creek diggings are being operated with success. Most of the miners have been able to do something during the week. Miners of Steamboat district have plenty of water and are doing well. Josephine county miners now have plenty of water and are making the most of it. Supt. Ennis of the Sterling mine has two giants busily at work. He expects to make a four-months run at least. More snow lies on the hills now than at any time during the winter, which will no doubt prove beneficial to the miners. The copious rains the forepart of the week did the miners go d, and they hope to see them repeated at once. Edson Bros. have purchased the big ditch in Siskiyou county of the defunct Yreka Creek Mining Co. and will repair it immediately. Walter Simmons of Galice creek made a cleanup not long since, after a 16 days run, and got \$800. He has struck a rich channel. J. T. Layton of Applegate has a force of men engaged in cleaning out his extensive ditch and will probably be at work this week. N. De Lamatter has both his claims near Kertyville running on full time and expects to make an excellent showing at the end of the season. J. Griffith, who is engaged in prospecting for quartz in the Hungry Creek section, just across the Oregon line, was in town Tuesday. He has high hopes of striking it rich. The miners of Willow Springs precinct are all busy and most of them have a good supply of water. Benner & Co. are at work as also D. M. Marden who has the Kane creek ditch rented.

UTAH.

REVIEW.—*Salt Lake Tribune*, March 13: The movement of metals for the week has been quite sluggish. The deplorable casualty at Alta, where ten men and two women lost their lives in a snow-slide, which, at the same time, swept away the New Emma works and machinery, has thrown a gloom over mining circles. The receipts of bullion in Salt Lake City for the week ending March 12th, inclusive, were \$101,177 95; of ore, \$9,600; aggregate, \$110,777 95. Last week the aggregate was \$120,525 22, of which \$111,645 22 was bullion. The shipments for the week ending March 8th, inclusive, were as follows: Forty-three cars bullion, East, 1,079,786 pounds; 6 cars white lead, East, 174,099; 1 car white lead, West, 20,000; 11 cars ore, East, 120,000; 61 cars, 1,391,885 pounds. The receipts of the Horn Silver Co. for the week were 14 cars, of the value of \$42,000, bringing the total for the year up to \$417,000. The Ontario shipments for the week were 28 cars, \$33,527 95, bringing the total for the year up to \$323,358 04. The Crescent made three shipments of ore during the week, amounting to \$9,600. The Stormont sent up one shipment, three bars of silver, amounting to \$5,150. The product of the Hanauer smelter for the week was ten cars of bullion, \$20,500.

PARK CITY.—*Record*, March 15: We have reliable authority for stating that the Empire will resume operations. Mr. Sampson, one of the former owners, and four other capitalists, have put in \$25,000 each, making \$125,000 with which to begin work. The company has been re-organized, and no stock will be placed on the market at present, nor until it is determined that there is a mine there. This amount of capital is put up for the purpose of fully developing the property, and if more is needed it will be forthcoming. The mine is at present almost entirely free from water, and the cost of pumping, which heretofore was one of the greatest expenses, will be very light. The water which stood in the mine for a long time did very little damage, as there are only two small caves resulting from it, and they can be fixed up at a small cost. We understand that work will commence immediately.

ORE SHIPMENTS.—Received at Mackintosh's Sampling works from the Crescent Mining Co. in last five days, 471,720 pounds of bullion. The Crescent shipments were cut off Sunday, Monday and Tuesday on account of the severe snow storms, which were the most severe of this season. The Sampson has shipped this week nearly two car loads of ore. The Apex has not been heard from as a shipper for some time past, on account of the impassable condition of the roads.

For Mining Shareholders' Directory, Stock Reports, etc., see page 216.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

[ESTABLISHED, 1869.]

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurates, Arsenides, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 150 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free.

REPORT OF MR. WRIGHT, Agent, Boston Mine, Lake Superior, Michigan: Average drilling, after two weeks' trial, with Improved Ingersoll Eclipse, National and Rand Rock Drills, in Jasper Rock, hard as iron, 16' drilling per shift big work:

Ingersoll, D2 3", large ports.....	1.785 ft. per hour.
Ingersoll, E, 3 1/2", medium ports.....	1.601 " "
National, improved, 3 1/2".....	1.280 " "
Rand, improved, 3 1/2".....	1.041 " "
Ingersoll, D2 3", beat Rand 3 1/2".....	.744 " "
Ingersoll, D2 3", beat National 3 1/2".....	.565 " "
Ingersoll, E, 3 1/2", beat National 3 1/2".....	.560 " "
Ingersoll, E, 3 1/2", beat National 3 1/2".....	.321 " "
National beat Rand.....	.139 " "

[ESTABLISHED 1864.]

THE MOREY & SPERRY MINING MACHINERY COMPANY,

Successors to MOREY & SPERRY,

Manufacturers of all Kinds of

Mine and Mill Machinery

WAREHOUSES:

92 & 94 Liberty St., New York.

WORKS:

Newburg, - New York.

The Foundry and Machine Shop in Newburg has been enlarged we are now prepared to receive from the most improved patterns QUANTZ and STAMP MILLS complete, for working GOLD and SILVER ORES.

MOREY'S IMPROVED PULVERIZER.

Steel SHOES and DIES for Stamps, and Mine and Mill Supplies. Agents for IMLAY ORE CONCENTRATOR and the MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given. Send for Catalogue.

Address,

THE MOREY & SPERRY MINING MACHINERY CO.

Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS, WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON

Orders Solicited and Promptly Executed.

Office, No 202 Market St., UNION BLOCK.

Mining Engineers.

WM. BREDEMEYER,

Mining, Consulting and Civil Engineer
56 East Fifth South Street,

SALT LAKE CITY, UTAH.

UNITED STATES MINERAL SURVEYOR for Utah and Idaho. Notary Public. Geological Examinations, Reports on Mining Properties, Surveys Mines, Railroads and Canals, and Superintends the workings of the same. Prepares Estimates and Plans for Opening and Working Mines. Expert on Mining Questions before the Courts. Address P. O. box 1157, Salt Lake City, Utah.

KINGSLEY & KELLER,

MINING ENGINEERS,
Silverton, Colorado.

Attention given to the Construction and Erection of all kinds of Mining Machinery, viz.: CONCENTRATORS, HOISTS, WIND-ROCK, and other TRAMWAYS, PUMPS, ETC. U. S. Mineral Patents obtained. Underground Surveys and thorough Reports made on all classes of mining properties. Consultations can be had on a strictly business basis, and for legitimate fees.

SCHOOL OF

Practical, Civil, Mechanical and Mining Engineering.

SURVEYING, DRAWING AND ASSAYING,

24 Post Street. San Francisco

A. VAN DER NAALDEN, Principal.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING FEBRUARY 26, 1884.
291,304.—REVOLVING CYLINDER ENGINE—J. Blair, Tacoma, W. T.
294,198.—SOFA BED—W. A. Clark, S. F.
294,220.—ALARM CLOCK—I. S. Goldman, Pasadena, Cal.
294,254.—FOLDING MAP RACK—F. P. Montgomery, San Jose, Cal.
294,270.—COMMUTATOR FOR DYNAMO OR MAGNETO ELECTRIC MACHINE—Rae & Healy, S. F.
294,288.—MEDICAL COMPOUND—Geo. Taylor, Redding, Cal.
294,293.—CIGAR AND MATCH HOLDER FOR TABLES—J. P. Walch, Suto, Nev.
294,175.—CRYPTOGRAPHICAL TABLE—J. L. Winneba, S. F.
3,930.—LABEL—B. Farley, S. F.
3,934.—LABEL—G. H. Holbrook, Portland, Or.

FOR WEEK ENDING MARCH 11, 1884.
295,097.—BRICK CUTTING MACHINE—T. M. Bannister, Lone Pine, Cal.
294,974.—HEN'S NEST—Ira B. Dillon, Visalia, Cal.
294,860.—FIRE ESCAPE—Elam Dye, S. F.
294,777.—WOOD WORKER'S DOG—John Forbes, S. F.
294,869.—NECKTIE FASTENER—O. M. Graves, Dayton, W. T.
294,895.—TIRE TIGHTENER AND JACK—McClosky & Tozier, Walla Walla, W. T.
294,805.—VENTILATING MINING SHAFTS—W. Phillips, Coos Bay, Or.
294,807.—OPERATING VALVES OF STEAM CYLINDERS—E. L. Reese, Newark, Ca.
294,923.—BELT HINGE—Eugene Smith, S. F.
295,065.—WASHING MACHINE—R. Smith, Cottage Grove, Or.
294,925.—PACK SADDLE—Smith & Hunter, Lone Pine, Cal.
294,927.—STEAM BOILER—Jos. Stevens, S. F.
294,932.—POULTRY FOUNTAIN—J. C. Tappeiner, Bisbee, A. T.
294,937.—HOSE PATCH—Geo. W. Towle, San Rafael, Cal.
294,943.—WINDMILL—Chas. W. White, Santa Rosa, Cal.
294,948.—GRIP FOR CABLE R. R.—J. W. Young, Ft. Maroni, A. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Mining Share Market.

With the exception of a few spurts, strikes have been rather dull all the week. Work is progressing as usual on the big mines of the Comstock, but no strikes are to be recorded. In the Union Con., on the 3000 level, a series of crosscuts is being run, at the ends of which the diamond drill is being put in for the purpose of tapping and drawing off the water. As soon as the water shall have run down sufficiently, the crosscuts will be advanced. These crosscuts are about 100 ft apart, and will pretty thoroughly explore the ground lying to the east of the main north and south drift.

In the Sierra Nevada the circulation of air is being regulated for the purpose of beginning prospecting operations on the 2900 level, where are some promising streaks of ore. During the advancement of the north lateral drift on the 2900 level, streaks of quartz assaying from \$2 to \$3 were passed through.

At the California and Con. Virginia they are now placing in position at the 2700 station a double hoisting engine, and when this goes into operation they will commence drifting from the bottom of the winze on the 2900 level.

At Gold Hill the several leading mines are taking out a sufficient amount of ore to keep the mills on the Carson river in constant operation. Plenty of ore will be found to keep the mills going all summer.

COAL.—In another column will be found the advertisement of Messrs. J. Macdonough & Co., 41 Market street, the leading importers and dealers in all kinds of foreign and domestic coal, coke and pig iron. Having discharging, and at all times large stocks on hand, an order for any quantity, large or small, will receive prompt and careful attention. Their stock embraces the best minings and brands of these articles, all being selected with regard to purity and excellence, a great item when expense of transportation is considered. They are in constant receipt and make specialties of Lehigh and Cumberland blacksmith coal and English foundry and smelting coke. To country merchants, manufacturers, foundrymen, mining men and others, special inducements are offered in what they may require in their line, and all who may favor this firm with a share of patronage will experience entire satisfaction both regarding price and quality.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replanted, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE CONR D'Alene mines seem determined to allow no Chinese miners in the camp. They will let the Mongolian cook or wash, but not do any mining work at all.

MINING SHAREHOLDERS' DIRECTORY.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

F. A. HUNTINGTON, SAW, SHINGLE, AND QUARTZ MILL MACHINERY.

We Call Attention to the Following Testimonials as to the Capacity and Durability of the Centrifugal Roller Quartz Mill:

SAN FRANCISCO, Dec. 27, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—
DEAR SIR:—The four-foot Centrifugal Roller Mill, bought of you in August, 1882, for the Whidden Gold Mining Company, of Shingle Springs, has given entire satisfaction, both on our own and on custom work, saving from 85 to 90 per cent of the gold in the mill. In conclusion I will say that we are so well pleased with it that Mr. Whidden and myself are putting one of the same size on the Tohonga gold mine, near Ravena, in Los Angeles county.

Yours truly, P. VEASEY,
34 California St., S. F.

FINE GOLD GULCH, Nov. 10, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—
DEAR SIR:—In reply to your inquiry concerning the working of your Centrifugal Roller Quartz Mill, I am pleased to say that I run one of them for seven months, doing custom work on different varieties of rock, and that the mill gave satisfaction in every respect, and did all that you claim for it.

Yours truly, BYRON JENNINGS.

GARIBALDI MINE, Dec. 17, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—
DEAR SIR:—In reply to yours of the 10th inst., I take pleasure in assuring you that your Centrifugal Roller Quartz Mill gives entire satisfaction, and I can heartily recommend it to mining men who want a cheap and efficient crusher.

Yours truly, E. I. PARSONS, Supt.

32 WASHINGTON AVENUE, 1
SAN FRANCISCO, Dec. 29, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—
DEAR SIR:—Having run one of your Centrifugal Roller Quartz Mills on sample lots of rock from more than twenty different mines, I must say that in every instance it has given the best of satisfaction in every particular; and I recognize its superiority over any other mill manufactured.

Very truly yours, D. O. MOWRY.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

F. A. HUNTINGTON, 45 Fremont St., San Francisco.

32 SAMPLE LOTS OF ORE WORKED.

CAPACITY AND DURABILITY GUARANTEED.

32 WHERE A MACHINE CAN BE SEEN IN OPERATION.

CENTRIFUGAL ROLLER QUARTZ MILL.

The work done by the Centrifugal Roller Quartz Mill, during the past two years, on various mines and different kinds of rock, proves all that is claimed for it, viz:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing comparatively small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.

SONORA, CAL., Dec. 1, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—
DEAR SIR:—In reply to yours of recent date, inquiring about the Centrifugal Mill which I bought of you, I will say that I have run the mill four months on hard rock; and I take pleasure in adding that the mill has in every way given the best of satisfaction.

Yours truly, J. H. NEALE.

GARIBALDI MINE,
Calaveras Co., Cal., Dec. 17, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—
DEAR SIR:—In answer to your inquiry concerning the working of the five feet Centrifugal Mill, bought of you for the Garibaldi mine in Calaveras county, I take pleasure in saying it gives entire satisfaction in every respect, and I only regret that the mine does not warrant the purchase of more of them and the continued use of the one now in operation.

Very truly yours, O. B. SMITH.

F. A. Huntington, Esq., San Francisco, Cal.—
DEAR SIR:—Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Co. property at Shingle Springs, El Dorado Co., Cal., about four months, and it has done good and satisfactory work, a greater proportion of gold remaining in the mill than in the stamp battery.

FRED JONES, Supt.

HILBRETH RANCH, Fresno Co., Cal.,
January 11, 1884.

F. A. Huntington, Esq., San Francisco, Cal.—
DEAR SIR:—In regard to your mill (Centrifugal Roller), I have crushed about 500 tons of rock in the mill, and am glad to say that it has given entire satisfaction, and can recommend it to the public as the most expeditious and least expensive method for crushing and milling ore that I have ever seen.

Truly yours, THOS. HILBRETH.

TATUM & BOWEN,

25, 27, 29 and 31 Main St., near Market, SAN FRANCISCO, and 187 Front Street, PORTLAND, OREGON.

SOLE AGENTS FOR

The Albany Lubricating COMPOUND AND CUPS, The Albany Spindle Oil, THE ALBANY VALVOIL,

THE ALBANY CYLINDER OIL, The Sight Drop Cylinder Lubricator.

WE ALSO IMPORT

LARD OIL, WEST VIRGINIA LUBRICATING OIL, DOWNER'S MINERAL SPERM SKID OIL, ETC.

32 These Lubricants have been for the last eight years, and are now, in general use in nearly all the mills, mines and steamers on this Coast, and the fact that the demand constantly increases is sufficient evidence of their superiority.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

Awarded SILVER MEDALS in 1882 and 1883
By Mechanics' Institute.

MANUFACTURED AT

The Tustin Windmill Horse-power and Pumping Machine Works.

TO THE LADIES.

MRS. ADCOCK, having just returned from the East, begs to offer to the public some of the FINEST GOODS ever imported to this coast at prices lower than ever before. 32 An inspection is solicited.

10 Kearny Street,
Band Box, 748 Market St., S. F.,
And First and Main Sts., Portland.

CLARENDON HOUSE,

574 Folsom Street, N. E. Cor. Second, S. F.
ENTIRELY RENOVATED & NEWLY FURNISHED.

Sunny Suites and Single Rooms with or without Board at reasonable rates. Hot and Cold Water. Folsom street cars pass the door. Location and Appointments unequalled in San Francisco.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barren crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

WANTED

TO BUY—A MINING PROPERTY. California gold quartz preferred. Don't want mine to stock, but to work as an individual enterprise. Prefer to own property alone, but might take a mine to develop for a controlling interest.

Address "WILSON,"
Care Mining and Scientific Press.

Iron and Machine Works.

MACBETH'S

—PATENT—

STEEL PULLEY.

Advantages of these Pulleys.
They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.
They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.
On account of their great lightness and the form of the arms, they absorb less power than any other pulley.
They are the only pulley of the kind which runs true. They cannot be broken in transport.

TESTIMONIAL:
MATHER LANE SPINNING Co. (Limited),
LEIGH, ENGLAND, Nov. 5, 1883.
N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.
They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.
Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

TESTIMONIALS.
ST. LOUIS, MO., Sept. 23, 1883.
Messrs. Adolphus Meier & Co. GENTLEMEN: We cheerfully certify that the "Heine Patent Safety Boiler" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, adaptable for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,
ANTHEUSER BUSCH BREWING ASSN

Office of Supt. of Royal Railways, Berlin, Sept. 23, 1883.
To Mr. H. Heine, Chief Engineer: In reply to your inquiry of September 21, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Platz Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.
(Signed:) BRAUCKE.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE
ever invented for the service of Prospectors and
others requiring the use of a Horse Power, possessing
all the requirements of a first-class hoist and affording means
for the continuous operation of a Pump or Blower without
interfering with a hoisting apparatus.
It is made entirely of iron; no piece weighs
over 250 pounds. At the ordinary speed of a horse a
1,000-pound bucket of ore may be raised 120 feet per
minute. The hoisting drum is under the complete control
of the man at the shaft, and is capable of carrying 500
feet of five-eighths steel rope. The cost of erection is
slight, as two men in half a day can easily put it in place
ready for work.
While this power is more particularly for mining pur-
poses, it is equally adapted to all other uses where animal
power is required. SEND FOR CIRCULAR.

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS.
at a depth of 500 feet. The Whim is mainly built of
wrought iron. The hoisting drum is thrown out of gear
by the lever, while the load is held in place with a brake
by the man tending the bucket. The standard of the
whim is bolted to bed-timbers, thus avoiding all frame-
work. When required, these whims are made in sections
to pack on mules.
120 in Actual Use.

— WHICH —

Anyone, upon examining, will proclaim to be far superior to anything yet offered to the MINING PUBLIC in the shape of a ROCK DRILL.

CALL AND SEE IT OR SEND FOR CIRCULARS.

\$1,000 CHALLENGE!

PRICE REDUCED,

Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS (\$575.00).

OVER 800 ARE NOW IN USE. Saves from 40 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the office of Hinchley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that all shaking motion applied to an endless traveling belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of \$1,000.

Examination of Hoisting Gear.

There is very little doubt that many of the accidents which occur from the breakage of wire ropes or hoisting gear of mines could be prevented if any regular systematic inspection took place. This is apt to be omitted or to be only attended to by subordinates, who may know more about trundling a wheelbarrow or dumping a car than the examination of wire rope. Another thing not always thought of is that the rope may be examined too frequently. This may appear like a strange objection, but daily routine work often becomes mere routine, and the man whose duty it is to inspect may think more of ridding himself of an irksome and frequently recurring task than of the actual results to be accomplished. To take the case of the hoisting rope: The person whose duty it is to examine it stands and looks at it as it is being rapidly let down or drawn up, and then signs a report declaring it to be in a sound condition. This person is perfectly aware that a serious defect might, and almost certainly would, escape his observation under such circumstances. But a sufficient inspection would occupy a good deal of time, and this consideration leads him to evade it. The same thing takes place with other machinery. The mischief is that this so-called examination prevents a real examination from being made at more distant intervals when sufficient time could be devoted to it. Hence defects remain unobserved, and sooner or later an accident happens. Daily inspection, therefore, is apt to be more a source of danger than tending to security.

But at least once a week the machinery, rope and all hoisting appliances, should be inspected carefully by a perfectly competent person who is not the one in daily charge of it. With a daily inspection there is a tendency to believe that nothing could have happened in the short intervals since the last examination, and a careless perfunctory overlooking of the rope is the result. But the consciousness that seven days have elapsed since it was last examined awakens an anxious desire to know accurately its present state. The galleys frame, shieves, ropes, gears, cages, guides, safety clutches, springs, brakes, and all of the appliances that go to make up perfect hoisting works, should be carefully and systematically examined at least once a week. This will take a little time of course, but this should not be grudged, as the safety of so many lives depends upon this gear. Of late years we have not had so many accidents with this part of the mining outfit as formerly. All the machinery and appliances, however, may be of the very best character, but they more or less want systematic periodical examination and care.

A new organization, known as the Young Men's Scientific Society, has elected the following officers: President, Milton S. Eisner; Vice President, George Nuttall; Secretary, Benjamin Ariner; Financial Secretary, C. G. Levi-son; Treasurer, Gus Brenner; Directors, M. Feintuch, H. C. Badger, H. W. Faust, J. W. Wolf. The society will give its first public lecture in about two weeks.

Snow is so deep on one branch of the Canada Pacific that no trains have passed for 18 days.

Nuggets.

It is not by any means an uncommon occurrence, in some of the mountain towns of California, for people to find small gold nuggets on the hillsides and in the gulches after heavy rains. If this was done once in a while in a distant country which we knew little of, we should read of it with wonder, and consider it a very desirable place of residence. Being at home, however, and near by, we pay little attention to such matters. In Mariposa county, for instance, over a thousand dollars in nuggets has been picked up since the last rain. The Mariposa Gazette of last week mentions the following instances:

The late storm has brought to the surface several gold specimens, which have been picked up and reported:

John Ellen picked up a piece of rock near Elkhorn ranch, supposed to contain at least \$1,000, which he sold for \$500. He was doing

WILLIAMSON'S DOUBLE DRUM FRICTIONAL HOISTING ENGINE.

some prospecting, since the rain, in the vicinity of the Brooks mine, about four miles north-easterly of the town of Hornitos. As prospectors are in the habit of doing, he, with his pick, was just turning over the scattered boulders and float quartz rock that lies upon the surface, when he caught the glimmer of gold sticking out from a small boulder, which weighed 20 pounds.

George Gordon picked up a specimen near town worth \$45.

Mr. C. V. Dingley, over on Mono, about five miles northeast of town, picked up a solid piece valued at \$100.

Raphael Farrias found a specimen worth \$44.

About \$150 was picked up in the streets of Hornitos, by different parties, some two weeks ago.

If these circumstances had been recorded of the Oeur d'Alene region, or of Alaska, people would have opened their eyes in wonderment. Of course such things do not occur every day, but that they happen at all will surprise some who think that California is a played-out mining country.

ALBERT ARENTS has been appointed Superintendent of the Mount Cory mine in place of Alex. G. McKenzie, deceased.

Improved Hoisting Engine.

The accompanying engraving shows the Williamson patent horizontal, double-drum, frictional-gear, hoisting engine. These double-drum friction hoists are made horizontal or inclined. Each drum is worked entirely independent of the other, having a steam pipe and valve connection to the engine separate from each other, so that when one is hoisting the other can be lowering, or one can remain stationary while the other is in motion. The engine is always running ahead, and each drum is operated entirely by one lever, which, at the same time the load is thrown on the brake, shuts off the steam for that drum, whilst the governor valve for the other drum remains unaltered. When both drums are thrown on at the brake, and are stopped or lowered at the same time, steam sufficient to keep the engine in motion is allowed to enter the cylinder through the starting valve. In the en-

graving A is the operating lever which throws the friction gear into or out of contact, releases or applies the brake, and opens or closes the governor valve. B is the throttle valve. After the lever B is set to suit the load, it is unnecessary to handle any other than the lever A for hoisting, stopping and lowering.

Several forms of these hoisting engines are made, with spur or friction gear. One engine is specially designed for steamships; another is made for prospecting purposes at mines, or for use on wharves, etc. They are made stationary or portable. The Williamson Brothers, of Philadelphia, manufacture these hoisting engines, and H. P. Gregory & Co., of this city, are sole agents for this coast.

A PETITION is being circulated at Cherokee entreats the Board of Supervisors to grant an appropriation from the General Fund or any other fund of the county of Nevada to aid the defendants in the Woodruff case, to assist in defraying the expenses of taking an appeal from the decision and decree of Judge Sawyer. The amount prayed for is \$5,000.

QUIRK, the defaulting wharfinger, has been sentenced to three years' imprisonment at San Quentin.

A Curious Mine.

There is at Sunny Corner, new South Wales, a mine that has been mined for gold for twenty years past, and has been the fortune of two or three men. The ore has been run through a five-stamp mill, and has yielded from half an ounce to twenty ounces of gold to the ton. By good fortune the water supply was short, and they had to settle all their tailings in tanks so as to save the tailings so as to save the water. They now find themselves in possession of a pile of tailings estimated as containing from 15,000 to 20,000 tons, and from many different assays made in the last year each ton will contain from 40 to 70 ounces of silver and from 5 to 7½ per cent lead.

An old California mining man, who is now managing the mine, writes to a friend in this city a letter describing the curious geological features of the mine. It is a flat lode. Above the crushing ore, which is a decomposed quartz, with some iron in it, is a pipe clay, spotted with small crystals of pyrites.

The crushing ore is from a few inches to four or five feet thick; then comes in some places a light red gossan iron ore, and below that a hard, flinty rock, that they never have gone through. In places a heavy lead ore is found between the gossan and the crushing stuff. It seems to run in channels, and sometimes will entirely disappear in a few feet. Since our California friend has been at the mine he has had the gossan assayed, and there is silver and lead in all of it, although to look at it no one could see any sign of either lead or silver ore.

In one place they sunk through the gossan and came on a galena lode. It is 24 feet wide, but is not very good, as it only gives about 18 per cent lead and 15 ounces silver. It contains a good deal of zinc and iron, and also some copper. When in the winze lately the Manager noticed the lode was all covered with little blue crystals of sulphate of copper. The water running out from the mine leaves thick coatings of metallic copper on the iron rails if they are immersed a short time. Several geologists and mineralogists of note have examined the mine, and they all say it is a very queer specimen of a mine. The gossan being under the ore makes our California friend believe that it has been turned upside down.

A COLORADO LOCATION.—A prospector who struck a lead in the Gunnison country not long ago, posted the following notice: "The undersigned claims this lode with all its drifts, spurs, angles, sinosities, etc., etc., from this stake a 100 feet in each direction, the same being a silver-bearing lode, and warning is hereby given to all persons to keep away at their peril. Any person found trespassing on this claim will be persecuted to the full extent of the law. This is no monkey tale butt I will assert my rites at the pint of of the sick shuter if legally Necessary so talk head and good warnin. Accordin to law I post This Notiss.—JOHN SEARLE."

JOHN EVANS was killed last Monday night at the Mount Diablo mine, in Candelaria, by the premature explosion of a blast. He was foreman of the Northern Belle until the mine closed down.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Hawthorne.

The Neighboring Mining Districts.

[From our Traveling Correspondent.]

EDITORS PRESS:—Hawthorne is a two-year-old town at the head of Walker Lake, Esmeraldo county, Nev., on the Carson and Colorado railroad, about 150 miles from Carson City; is the county seat of Esmeraldo county.

The platting and building a town at this point seems well advised. The view of the distant mountains with all their varied crownings, gorges and irregular bases and declivities presents a border to the extensive plains that surround Hawthorne, at once grand and pleasing to the visitor. The gentle slope of the open plain to the east looks on the bright, clear surface of Walker Lake with its clean gravelly beach, the delight of the bathers in the hot summer season. The lake seems to a stranger scarcely a mile off, when he is informed that it is 3½ miles; the atmosphere is so clear that distant objects seem very near.

Hawthorne is named after W. A. Hawthorne, now an acting Judge in this place, and highly esteemed citizen. The population is now about 1000; is well supplied with stores and machine shops, and is largely drawn on for supplies for all the various districts that radiate from this as a common center in every direction.

West of Hawthorne eight miles is the

Walker Lake Mining District.

Where the Emerald Mining and Commercial Company have a group of ten mines in one solid, unbroken hill, some of which claims they have partially developed, showing free milling gold ore with a small amount of silver. The Bull of Woods, now called the Morning Star, has two drifts each over 100 feet long where they strike good ore ledge 2½ feet thick, giving average assays from wall to wall of \$45 in gold, worth \$15 per ounce.

The prospect ore taken out was worked in the company's own mill in quite a satisfactory manner, yielding about \$2,000. They were employing twelve men on eight-hour shifts driving on the tunnels on the vein to open up stopings preparatory to starting up the mill for steady running. Expected to have a length of 250 feet in each drift on the ledge by March 1st—making stopings of 200 feet depth from the surface. This whole group of mines can be tapped at a depth of 2,500 feet by a tunnel 2,500 feet in length, and thus discharge the ore where wood and water are plenty and of easy access from the open valley below. The principal owners of this property are Messrs. Knapp and Laws, Forbes and Tohey and W. A. Hawthorne, all of Hawthorne.

The next to the southwest are the Corey and Big Indian mine.

The Powell Creek mines are also giving good reports of free gold ores, and still higher up on the mountain yielding also silver ores. The Alum Creek mines are spoken of as very promising prospects, all yet in the hands of poor men. Whisky Flat, off to south of Hawthorne about 14 miles, has considerable development work. One vein of 5 feet thickness gives rich silver ore that they have shipped away and got net \$600 per ton after paying shipping and milling expenses. The Prince mine, in the same district, is looking well and giving good ores, assaying \$1200 per ton. Still south of that are the Perrington copper mines, 20 miles from Hawthorne, showing extensive mines, and very favorable indications for a rich camp.

Passing still further around in the circuit to the east of Hawthorne 16 miles, we are in

Garfield District.

Where Farrington and Moss with many other locations, are proud of their rich surface outcroppings. The Farrington and Moss are down about 500 feet with large bodies of ore that will yield from \$100 to \$300 per ton, from which they have milled several hundreds of thousands of dollars. Some was sent to Belleville and to other mills, leaving large amounts of second-grade ore on the dumps. Then on a little more eastward is the Santa Fe district, lying about 30 miles from Hawthorne—a large district, and known to contain some good ore in different mines. There is much room yet here for prospecting.

"Gillis Mountain and Dry Hill."

On to the northeast, and about the same distance as this district, is the Gillis mountain and Dry Hill country, extending around to the east side of Walker Lake.

The Gillis has been taking out and shipping away a considerable of high grade ore. The Moss and McDonald mines in the Dry Hill range, are reported rich in free milling ores. There are many other suburb or tributary camps lying around Hawthorne that as yet are scarcely touched by the prospector, and yet give evidence of being mineral grounds and must soon prove tributary to this common center and depot for this whole region.

The town is growing steadily. The best building is the brick court house. They are erecting a public school edifice. There are three grocery and general merchandise stores, several general variety stores, one dry goods store, one drug store and a full supply of saloons, restaurants, and hotels. All these institutions and the city father's are under the careful and

fatherly criticism of two ably conducted newspapers, ready to issue an extra to announce any important item of information. Such is Hawthorne and a small portion of its tributaries with the great bonanza. Mt. Cory mines purposely left out, as worthy of a separate mention. Hawthorne is surrounded by 50,000 acres of valley land, which may prove valuable if any successful means of irrigation are discovered.

B. W. CROWELL.

Precipitation of Gold.

EDITORS PRESS:—"From a practical point of view certainly none," in reference to a proposed method of obtaining "pure gold," or I will say, nearly pure gold, at once, in place of a mixture of gold sulphide with copper sulphide, is language on which comment would be thrown away; and I would like to ask if the ignorance of the writer of the article referred to (MINING AND SCIENTIFIC PRESS, March 1st) in regard to the precipitation of gold by copper sulphide, is a valid reason for the rejection of such a process without trial. The method is "bazaarous" in the estimation of that writer, simply because he does not know whether it would work or not. Why should he not inform himself before condemning? It would not be a very difficult matter for a person making the experiment to ascertain whether the decomposition was complete or otherwise; or, which is the main point, whether any gold remained in the solution or not.

The saturation and "considerable excess" plan would prevent the use of hydrogen sulphide except with liquids free from copper "even in small quantities," while my plan, if successful, would enable its use in the presence of any quantity of copper.

Again, I would ask: In what way does the presence of free chlorine interfere with the use of iron protosalts as precipitants, beyond causing an increased consumption of those? It converts them into persalts—so does gold telluride. The chemists—or some of them—tell us that iron persalts can dissolve gold, but I have found, by experiment, that they don't dissolve a perceptible quantity of it in the presence of an excess of the protosalt.

Nitric acid is so unusual a constituent of the leach that it may be passed over, but as to the "series of terchlorides and hypochlorites" which may cause an incomplete precipitation, the question in which we are interested is, do they? Or, is it another case of "not ascertained" (by the writer in question)?

C. H. AARON.

Reduction Works in New Mexico.

The Review publishes the following valuable summary of the condition of mining plants in New Mexico:

There are in the Territory 46 plants and reduction works. Forty-five of these have abundance of available ore right at hand, but 37 are not in operation. Cause: Mismanagement, lack of funds or corporative manipulation. The Hub's smelter at Albuquerque is the only one in the Territory that has not pay right at its door. In no other instance is the cause of idleness to be attributed to the want of ore. This being a fact, isn't it a rather sad commentary on the mining interests of New Mexico that so much valuable machinery should continue to lie idle? Mismanagement and lack of capital are partially responsible, as before stated, but stock jobbers and mining sharks have a great deal to answer for in the matter—it isn't the work of the miners! The list is as follows:

- *+* One 10-stamp mill at Elizabethtown.
- *+* One 30-ton smelter at Los Cerrillos.
- *+* One 10-stamp mill at Golden.
- *+* Two 30-ton copper smelters at San Pedro.
- *+* Two reverberatory furnaces at San Pedro.
- *+* One 40-ton water-jacket smelter at Santa Fe.
- *+* One 30-ton copper smelter at Nacaminto.
- *+* One 30-ton smelter at Albuquerque.
- *+* One 10-stamp mill at Socorro.
- *+* Two 30-ton water-jacket furnaces at Socorro.
- *+* Three 80-ton furnaces at Socorro.
- *+* One 30-ton smelter at Magdalena.
- *+* One 25-ton smelter at Fairview.
- *+* One 60-ton concentrator at Chlorido.
- *+* One 10-stamp gold mill at Negai.
- *+* Two 10-stamp gold mills at Hillsboro.
- *+* One 30-ton lead smelter at Organ.
- *+* One 30-ton copper smelter at Organ.
- *+* Two 10-stamp mills at White Oaks.
- *+* One 30-ton smelter at Deming.
- *+* One 30-ton sampler at Lake valley.
- *+* One 60-ton smelter at Lake valley.
- *+* Two 20-stamp mill at Lake valley.
- *+* One 30-ton smelter at Kingston.
- *+* One 10-stamp mill at Georgetown.
- *+* One 10-stamp mill at Mimbre.
- *+* One 20-stamp mill at Santa Rita.
- *+* One 30-ton smelter at Santa Rita.
- *+* One 20-ton galena smelter at Ivanhoe.
- *+* One 20-ton copper smelter at San Jose.
- *+* Two 10-stamp mills at Silver City.
- *+* One 20-stamp mill at Steeple Rock.
- *+* One 20-stamp mill at Shakespear.
- *+* One 30-ton smelter at Hachita.
- *+* One 30-ton copper smelter at Burro Mountain.
- *+* One 20-ton concentrator at Kingston.
- *+* Two reverberatory furnaces at Burro Mountain.

- * Indications not running.
- † No money to carry on business.
- ‡ Pay ore available.

Up around Columbus they have some lovely and quite suggestive names for borax works. There is the Tenderfoot, the Lovely Pill, the Red Head, the Bellyache, and so on ad nauseum.

The Volumetric Determination of Manganese.

The following paper by J. B. Mackintosh, E. M., New York City, was read at a meeting of the American Institute of Mining Engineers:

In a recent paper read before the Institute on this subject, Mr. G. C. Stone advances the theory that the precipitate obtained in Williams's volumetric process, by heating the boiling nitric acid solution of a manganese salt with potassic chlorate, is not pure, MnO_2 , but approximates more closely to the composition, $10MnO_2 + MnO$.

As the value of the process and the accuracy of our results would depend on whether this was the fact or not, it has seemed to me, and to my associates, Messrs. Beebe and Colley, that it would be of importance to ascertain the composition of this precipitate, and to that end the following series of experiments has been undertaken: These experiments have all been based on the considerations:

1. That potassic permanganate has an oxidizing power equivalent to five atoms of oxygen for every two of manganese: $K_2Mn_2O_8 = K_2O.2MnO.O_5$.

2. That the same amount of manganese, in the state of binoxide, has an oxidizing power equivalent to two atoms of oxygen: $2MnO_2 = 2MnO.O_2$.

If, then, we take a solution of permanganate of unknown strength, and reduce it to binoxide, the oxidizing power of the binoxide formed will be equal to that of two-fifths the quantity of the p-manganate solution originally taken. While, if the precipitate obtained should not be binoxide, but an indefinite or definite mixture of bin- and mon-oxides, then, from its equivalent oxidizing power, we can calculate its composition.

The analyses were conducted in the following manner: The amount of permanganate taken was decomposed with hydrochloric acid, and concentrated to expel the excess of water. Sufficient excess of nitric acid was now added, and the solution was boiled until all the hydrochloric acid was destroyed. The manganese was then precipitated by potassic chlorate; and, after standing some time to cool—a precaution which we consider of importance—the precipitate was filtered out through asbestos, washed with nitric acid and then with water; and, when perfectly clean, was treated with a volume of oxalic acid, whose equivalent in permanganate was known, a few cubic centimeters of sulphuric acid being also added. The excess of oxalic acid was then estimated by permanganate, and the difference between this amount and the equivalent of the whole amount of oxalic taken gave the oxidizing power of the precipitate.

To save multiplication of figures we will only give the results obtained:

$K_2Mn_2O_8$ used.	Oxidizing power of precipitate in terms of $K_2Mn_2O_8$.	Theoretical for MnO_2 .	Apparent per cent. of theoretical.	Corrected per cent. for burette error.
c.c.	c.c.	c.c.		
45	17.50	18	98.89	99.37
35	13.93	14	99.50	100.07
25	9.90	10	99.00	99.85
15	5.96	6	99.33	100.67

Average true per cent., 99.99.

The precipitation in the above results was effected by successive alternate additions of potassic chlorate and nitric acid, until no further formation of yellow fumes was observed. Shortly after first employing the method, we noticed that the reaction was seldom complete when potassic chlorate was added during one period only; and that if, after the apparent completion of the reaction, as marked by the explosive cessation of yellow fumes, more nitric acid was added, and then a fresh portion of potassic chlorate, that the yellow fumes would reappear, again to disappear with the characteristic puff. On this account it is necessary, in employing this method, to add alternate amounts of nitric acid and potassic chlorate, until no further effect is produced; and, if this precaution is not observed, the results will almost invariably be low.

The next series of experiments was made to illustrate this point, and to determine the amount of error which would be incurred by exactly following the directions given by Messrs. Ford and Williams in their respective papers, namely, by adding potassic chlorate during one period only, and boiling till the apparent cessation of the reaction. The results obtained were as follows:

$K_2Mn_2O_8$ used.	Oxidizing power of precipitate in terms of $K_2Mn_2O_8$.	Theoretical for MnO_2 .	Apparent per cent. of theoretical.	Corrected per cent. for burette error.
c.c.	c.c.	c.c.		
40	15.55	16	97.20	97.32
45	17.70	18	98.33	98.92
60	23.37	24	97.40	98.04

Showing an error of from one to two per cent. The following determinations were made about last February, but no particular record

of the details of the manipulation were preserved:

25	9.93	10	99.30	98.34
50	19.73	20	98.65	99.07

It is evident, from inspection of these results, that the first set approach very nearly to the theoretical figure for MnO_2 , the average of the four happening to be 99.99 per cent. This close agreement with the theory must, however be considered as largely accidental, as the variation in the separate determinations is quite large. In a process of this kind we must consider that the experimental errors are relatively large; indeed, larger than in the actual application of the method to analysis. These experimental errors, doubtless, balance each other to a large extent by averaging several results, as in the present instance; but we can hardly expect to get such close average results every time.

The burette was calibrated for each analysis by weighing the amount of water delivered corresponding to the various volumes used, and making proportional corrections.

Now, if the composition of the precipitate had been $10MnO_2 + MnO$, as claimed by Mr. Stone, the oxidizing power found should have averaged 90.91 per cent of the theoretical figure for MnO_2 , instead of that which we have actually found; so that the difference is far too great to admit of any doubt as to the true composition of the precipitate. We may safely conclude, then, that the precipitate obtained in this process, when due regard is paid to the precautions which we have indicated, is MnO_2 , and not an indefinite or definite mixture of oxides, that the process is reasonably accurate, and that any estimation based upon the theory that the precipitate is not MnO_2 is of no value, because it is founded on false premises, and therefore can never be true save by accident.

Consolidating Mining Locations.

In the case of the St. Louis Smelting and Refining Co. vs. Kemp and Nuttall, on appeal from the U. S. Circuit Court of Colorado, the U. S. Supreme Court recently rendered a very important decision relative to the consolidation of mining locations and making the annual expenditure required by law for each and all of such locations upon one shaft or tunnel. The opinion of the Court was written by Justice Field of this State, and is very liberal toward the working miner. A broad distinction is made between a "location" and a "claim," a location being held to be that quantity of mining ground which one person may legally acquire by location in one body (i. e., 1500x600 feet, or less), while a claim may embrace a dozen such locations acquired by purchase, provided they be contiguous—and the annual expenditure required for each of the dozen locations so embraced in such claim may be made upon any portion of the claim, "when such labor is performed or improvements are made for its development; that is, to facilitate the extraction of the metals it may contain, though in fact such labor and improvements may be on ground which originally constituted one of the locations, as in sinking a shaft, or be at a distance from the claim itself, as where the labor is performed for the turning of a stream, or the introduction of water, or where the improvements consist in the construction of a flume to carry off the debris or waste material." This is the language of the Court; and it further says that "it would be absurd to require a shaft to be sunk on each location in a consolidated claim, when one shaft would suffice for all the locations." By the provisions of section 2330 of the Revised Statutes of the United States, two or more persons, or associations of persons, having contiguous claims of any size, are allowed to make a joint entry thereof, and in the decision from which we quote the Court says that "no motive can be imagined for allowing two or more persons to unite their entries in one survey which does not apply with at least as much force for allowing a single person to unite his entries adjoining each other in one survey."

DRY GOLD WASHER.—In the rear of A. Weill's store may be seen a dry-washer, or a machine to separate gold from the dirt, sand or gravel in placer diggings that are destitute of water. Since the gold era commenced a great many machines have been invented for this purpose, but none of them have been used to any great extent, and probably one equal to all requirements was never made. The one under notice, however, impresses everybody favorably. The construction is simple and easily understood, and it is impossible to see any reason why it will not fulfill the purpose of its construction perfectly. But this is not a matter in doubt, as it is said to have been thoroughly tested. The inventor, a German now living in this vicinity, used one made after the same model, last summer, in Lower California, and it worked to the admiration of all who saw it, while the one here has been tried on the gold-bearing gravel of the bluffs, and found to do all claimed for it by the inventor. It works by hand-power, and turns as easily as a fanning mill. It is claimed that with the work of five men it will separate the gold from fifty tons of dirt or gravel per day. It is well worth examination by all who take an interest in mining. There are dry diggings in this county where this machine might be profitably used.—*Bakersfield Californian*.

MECHANICAL PROGRESS.

Producing Compound Plates by Welding.

In compound plates as heretofore manufactured from layers of hard and soft steel and iron, while uniting the hard material with the soft, and in the further manufacture of the plates when in a heated condition, a considerable proportion of the carbon passes from the hard to the soft layers. The object of manufacturing compound plates is thus to a great extent frustrated; furthermore, difficulties arise in the manufacture, because, according to conditions of temperature, more or less carbon passes into the soft layers, so that in many cases the requirements as to the amount of carbon to be contained in the plates are not obtained. To overcome this difficulty Mr. F. A. Krupp, of Essen, welds between the hard layers and soft layers of compound plates a thin layer of such metal or metallic alloy as will prevent or, at any rate, much impede the passing of carbon from the harder into the softer layer. Such or suitable metals and alloys of metals as will, on the one hand, much impede the passing of the carbon, whilst, on the other hand, will readily become welded to iron or steel or to chilled cast iron, are, for instance, nickel, cobalt, and highly silicious iron. He uses by preference sheets or plates of nickel welded on both sides to sheets of iron, and he thereby attains his object with a comparatively thin layer of nickel. The invention is applicable not only to compound plates, but also to other articles which are composed of hard and soft kinds of steel and iron, and may be applied in various ways. As a rule, however, the conditions of temperature of the layers to be combined with one another must be so chosen that the intermediate layer is welded with the iron and steel, but is nevertheless not melted.

The simplest method of making such a plate is to make the intermediate plate as if it were a partition in mold or form into which hard steel is poured at one side of the intermediate plate, whilst mild steel or homogeneous iron is poured in simultaneously at the other side. If it is desired to avoid the pouring in of hard and soft metal at the same time, then one material is first poured against one side of the intermediate plate, which is firmly fixed against the wall of the mold. The casting having congealed or set sufficiently, and being of a suitable temperature, is then placed in another mold, and the other material is then poured against the other side of the intermediate plate. If, for instance, the compound plate is to consist of annealed or puddled iron and cast steel, then the welded plate, when it has been welded for the last time, has for its inside last layer welded to it, for example, a sheet of nickel, having welded on both its sides sheets of iron, and then casting on the other side of the welded plate a layer of steel in any convenient manner. Or the intermediate plate may be of highly silicious iron. The manner in which the process or invention must be modified, when the plates to be manufactured are to consist of several alternate layers of hard and soft material, is obvious.—*The London Mining Journal*.

NEW PROCESS FOR HARDENING WROUGHT IRON. The Marquette (Lake Superior) *Mining Journal* has recently witnessed some practical experiments with a new method for giving a hard steel surface to ordinary iron by a process which that paper characterizes as "at once simple, cheap and inexpensive." The experiments are described as follows: "The inventor took a piece of ordinary rod iron, heated and dressed it into shape as a cold chisel. It was then sharpened in the usual way, when it was subjected to treatment by the new process, which is, it is almost unnecessary to add, a secret with the person who discovered it. In a few minutes it was given to the newspaper delegate to experiment with, when he found the edge surface so hardened that it would actually cut glass like a diamond. A file that was tried upon it came out of the encounter bereft of its teeth. Nothing that the reporter could find then or since—not even the most powerful acids—can affect the wonderful surface and edge produced by the process, whatever it is. At the same time the parts not treated remain as before, ordinary iron, and nothing more, upon which a jack knife is capable of making a well-defined impression. The cold chisel thus made lies on the editorial desk as we pen this, and a badly scratched window pane just opposite bears evidence of the superior hardness of the tool. The invention is a valuable one for a thousand uses. Mr. M. L. Hayley, the inventor, is a practical worker in iron, and feels confident that his process will come into general use for a multitude of purposes as soon as its utility comes to be generally understood."

NATURAL GAS IN THE PRODUCTION OF IRON. At the late Cincinnati meeting of American Institute of Mining Engineers, Capt. Wm. R. Jones made an interesting statement in regard to the use of natural gas at the Edgar Thomson Steel Works. Captain Jones stated that natural gas was destined to play an important part in the economies of production at the works near Pittsburgh. The Edgar Thomson Steel Works own a gas well at Murfreesville, some 12 miles from their mill. From this well an 18-inch pipe is laid to the works. At the well the

pressure is about 120 pounds to the square inch, which is reduced in transmission to about 60 at the works. The gas is used in the boilers, of which there are 48. Some 15 to 16 volumes of air are required to properly consume 1 volume of gas. At first the gas was conveyed through a 2-inch pipe, to which a reducer was attached, to weaken the pressure direct to the boilers, but this was dangerous, creating a liability to explosion. The plan now is to have the gas in checker-work. Its use at these boilers has enabled them to dispense with 82 men. He had also used the gas in the carbonization of spiegel in the ladle, blowing it into the bottom of the molten metal.

Influence of Cement Mortar on Lead Pipes.

A late number of *Metallarbeiter* illustrates the peculiarities exhibited by leaden pipes which had been imbedded for five years in a layer of Portland cement. A red coating was noticed from 1-24th to 1-8th of an inch in thickness, the appearance of which corresponded with that of oxide of lead as it is usually delivered in commerce. This coating was carefully removed, and the particles of lead removed with it were separated by means of a magnifying glass. The specific gravity of this powder (carefully defined at 59 F. and reduced for a vacuum) varied between 8.002 and 9.670. This variation is explained by the presence of metallic lead mixed in the oxide of lead, and carbonate of lead. Qualitative analysis demonstrated that this powder contained oxide of lead, lead, carbonic acid, water and traces of calcium. The composition of the powder was as follows:

Oxide of lead.....	84.89
Lead.....	12.33
Water.....	0.99
Carbonic acid.....	1.53
Lime.....	Traces.
Insoluble in nitric acid.....	0.16

This coating on the lead pipe appears to have been formed by the action of the oxygen in the air in union with that of the lime contained in the mortar. It is remarkable that the action of lime water on lead has also been noticed by Besnoot.

TREATING RHEA FIBER. A prize of five thousand pounds was offered by the Indian government for the best machine for the treatment of rhea fiber. In 1869, a Mr. Greig of Edinburgh made a machine for this purpose; but it did not fulfill the conditions laid down, so the full prize was not awarded. Another competition took place, but was unsuccessful. Some rhea fiber experimented on in 1852 by Dr. Forbes Royle was in strength, as compared with St. Petersburg hemp, in the ratio of 280 to 160, while the wild rhea from Assam was as high as 343. Rhea has the widest range of possible applications of any fiber, as shown by an exhaustive report on the preparation and use of rhea fiber by Dr. Forbes Watson. Last year, however, says the *Engineer*, witnessed the solution of the question of decortication to the green state to a satisfactory manner by Mr. A. Favier's process. This process consists in subjecting the plant to the action of steam for a period varying from ten to twenty-five minutes, according to the length of time the plant had been cut. After steaming, the fiber and its adjuncts were easily stripped from the wood. Mr. Favier's process greatly simplified the commercial production of the fiber up to a certain point; but it still stopped short of what was required, in that it delivered the fiber in ribands, with its cutaneous matter and outer skin attached. Various methods of removing this were tried without success, until a year ago the whole case was submitted to the distinguished French chemist, Professor Fremy, member of the Institute of France. Professor Fremy carefully investigated the nature of the various substances, and found that the vasculose and pectose were soluble in an alkali under certain conditions, and that the cellulose was insoluble. He therefore dissolves out the cutose, vasculose, and pectose by a very simple process, obtaining the fiber clean and free from all extraneous adherent matter, ready for the spinner.

BESSEMER STEEL.—The Scranton (Pa.) *Republican* of Jan. 19th says: "In converting steel by the Bessemer steel process the pressure of blast used generally runs from fourteen to twenty pounds per square inch. Few works have engines of capacity and power sufficient to maintain a pressure of over twenty-five pounds while blowing a heat. On Wednesday, January 23d, however, while blowing a heat in their converting works, the Scranton Steel Company maintained with their engines a continuous blast pressure of fifty pounds to the square inch. On Thursday last they went a step further and performed the feat of blowing a heat in each of their two converters at the same time. The heat weighed four and one-half tons each, and were blown in twelve minutes. So far as known both of these feats are without precedent at any Bessemer works elsewhere."

PLATINUM heated in a forge fire in contact with charcoal becomes fusible. Bonssigaull has shown that this is due to the formation of a silicide of platinum by means of the reduction of the silica of the carbon by the metal. Two German savants have produced the same phenomenon by heating to white heat a slip of platinum in the center of a thick layer of lamp-black free from silica.

SCIENTIFIC PROGRESS.

Will the Telephone Supersede the Telegraph?

The rapid development of the telephone and its many applications to the business and social life of the period are among the most surprising of the numerous astonishing revolutions of modern applied science, and, judging from the outcome of some recent experiments in this direction, it would seem that we are as yet only on the verge of still greater results than those already obtained. Auditors and transmitters have been made more sensitive, and resistance and induction—the great obstacles to telephoning have been materially overcome by ingenious devices. In consequence of these improvements it has been rendered possible for persons to converse without difficulty between New York and Cleveland. There can be no reasonable doubt that the telephone can soon be used with complete success with the ordinary telegraph wires. What the final outcome of experiments of this kind will be it is difficult as yet to conjecture. That one result will be to enlarge the uses of the telephone and make it more and more an adjunct of business methods has already been demonstrated. The problem now is, will it take the place of the telegraph, and, if so, to what extent will it do this? The limit to a telephone's work is the rapidity of a person's utterance. The limit of the telegraph is constantly being extended and we can already in the duplex and quadruplex apparatus and in the more recent devices of the Postal Telegraph Company, which have succeeded so well experimentally see results greater than any which depend on oral enunciation. For general business, indeed, it is hardly likely that the telephone will supersede the telegraph, but the former has a field of its own, which is nearly, if not quite, as important and it promises to create much new business while adding to the facilities for communication. *Manufacturer and Builder*.

New Method of Mounting Reflectors.

It is well known to all who have given attention to this subject, that the optical performance of great reflecting telescopes has not been proportional to their size, and that the mechanical difficulties of keeping a large reflector in proper figure in different positions have been apparently insurmountable. A plan of supporting a large mirror, devised by Mr. Henry, has been adopted in Paris, which, it is hoped, may obviate this difficulty. It consists, in principle, in supporting the mirror upon a second surface, ground to fit it with accuracy when the mirror is in proper shape. If the mirror rested directly in contact with this second surface, no advantage would be gained, since the backing itself would bend as readily as the mirror. Therefore, between the two is inserted a thin stratum of some elastic substance. Mr. Henry has found a fine sheet of flannel to give the best results. The effect of the sheet is to diminish the flexure of the mirror by a fraction depending on its stiffness and on the elasticity of the flannel. Theoretically, it may be considered imperfect, because, in order to act, some stiffness is required in the mirror itself. A perfectly flexible mirror would bend just as much with the flannel as without it. But the flexure of the mirror can, it appears to me, be reduced to quite a small fraction of its amount. Moreover, I see no insuperable objection to the superposition of two systems of the kind; the mirrors resting upon a stiff disk, which is itself supported upon a second one. This plan has been entirely successful in the cases in which it has been applied. Mirrors up to twelve inches in length show not the slightest flexure when moved into all practical positions. Unfortunately it has not yet been tried with reflectors of a larger size.—*From a report to the Secretary of the Navy on improvements in astronomical instruments*.

PHOSPHORESCENCE IN LIMESTONES.—At a meeting of the Academy of Natural Sciences, Philadelphia, Prof. H. C. Lewis exhibited a specimen of limestone from Utah that emitted a lurid red light when struck, scratched or heated. The glow lasted from half a second, when lightly struck, to a much longer time, as the result of a blow. On examination, the specimen proved to be an almost perfectly pure carbonate of lime, with but a slight percentage of impurities. It is loose-grained, white and crystalline, the grains being but slightly coherent, thus giving the rock the appearance of a soft sandstone. It crumbles easily between the fingers, forming a coarse sand. When beaten in a glass tube over a flame, it glows with a deep red light, which lasts for a minute or more after withdrawing the flame. After two or three heatings, the phosphorescent property disappears. A search through the collection of the Academy for limestones having similar properties resulted in finding specimens from Kaghberry, India, which glowed with a strong yellow phosphorescence when heated, although no such effect was produced by scratching or striking. It was of great interest to find that the India limestone alone, of all in the collection, had the precise external characters of that from Utah.

This similarity is more than a coincidence. It confirms Bequerel's view that phosphorescence depends upon physical rather than chemical conditions. In the rocks referred to it is probably dependent upon a disturbance of their loosely aggregated crystalline particles, whether such be produced by percussion, friction, heat or decrepitation.

THE MATRIX OF THE DIAMOND.—Until the South African mines were discovered, the diamond was generally found in sands and gravels different from the mineral in which it was believed to be formed. At Gripurand West, however, the consolidated eruptive mud of the mines was believed by some to be the true matrix of the diamond; but opinions differed on the question, and arguments were found on both sides. M. Chaper, a French geologist, has, however, during a scientific mission to Hindostan, succeeded in finding the diamond in its mother rock. At Naizam, near Bellary, in the Madras Presidency, M. Chaper has found the diamond in a matrix of rose pegmatite, where it is associated with corundum. The tract of country is almost denuded of trees, bare and rocky, and the rains wasting the rocks, every year expose fresh diamonds in the soil. The rock is traversed by veins of feldspar and epidiotiferous quartz. Here the diamond is always found, associated with epidiotiferous rose pegmatite. The diamond crystals observed are octahedral, but less distinct in line than the stones of South Africa, which seem to have been formed in a freer matrix. It follows from M. Chaper's discovery that diamonds may exist in all rocks arising from the destruction or erosion of pegmatite, for example, in quartzites with or without mica, clays, pudding-stones, etc. *Engineering and Mining Journal*.

HOW A SPIDER LIFTS HEAVY OBJECTS.—Last summer, while at Lynchburg, Va., I observed a spider—probably an *Epeira*—spinning a thread down from the upper section of a large fountain on the lawn of the Arlington hotel. He was some eight feet from the surface. I watched him descend to the water, where he captured a beetle that had unfortunately fallen into the large basin. The beetle must have been an inch long. Our *Epeira* made a turn of his line around his captive, and ascended all the way to his nest; immediately descending, he threw another loop around his prey, and again ascended to his nest, continuing this process for full ten minutes. To my surprise, while the spider was at his web, apparently overhauling and tightening the several threads that he had spun to and from the beetle, it left the water, and, evidently by elastic contraction of the threads, ascended full an inch from the surface. The spider spun down another lasso, and threw it round his victim, then retired and was busy with his lines, when the beetle again moved upwards. These operations were repeated, until, at the end of forty-five minutes, he had singly secured his prey in his nest, at a distance of at least eight feet from the water, by this curious and interesting method.—*Science*.

THE PHILADELPHIA INTERNATIONAL ELECTRICAL EXHIBITION OF 1884.—This exhibition, to be held under the auspices of the Franklin Institute, will open September 2d, and close October 11th. Under a joint resolution of Congress, articles from abroad, imported solely for exhibition, may be entered free of duty. Exhibitors must pay an entrance fee of \$5, and from ten to twenty cents per square foot for space. Exhibits will be classified as follows: Production of Electricity; Electric Conductors; Measurements; Applications of Electricity—1. Currents of low power—2. Currents of high power; Terrestrial Physics; Educational and Biographical. The exhibition building is the corner of Thirty-second street and Lancaster avenue, and will be opened for the reception of goods from August 11th to August 30th.

SUGAR IN TOBACCO.—That tobacco, as ordinarily prepared by some of the manufacturers, is frequently sweetened with molasses, honey, licorice, etc., is not doubted, but we think it will be a surprise to most people to learn that a considerable percentage of sugar is a natural constituent of tobacco. Yet such has been demonstrated to be the fact by Prof. Atfield, F. R. S. Eight samples were obtained from planters in different parts of Virginia, Kentucky and North Carolina, which gave, to 100 parts of leaf, from 5.57 to 9.60 parts of tobacco sugar, and from 8.23 to 12.80 parts of total saccharoid matter. In tobacco grown in unfavorable conditions, or without sufficient heat, the amount of sugar is often but a mere trace, while for light colored or bright Virginia leaf it will average about ten per cent.

TO DETERMINE THE ADHESIVE POWER OF GLUE.—Weidenbusch has devised a practical method for determining, approximately, the adhesive power and quality of glue. He first prepares a set of plaster prisms by mixing gypsum and water together in the proportions of one to five. These prisms are 9.2 cm. (about 4 inches) long, with a cross section of 4 millimeters (1/8 in.), and each weighs 1.7 grammes (26 grains). The glue solutions were made from 1 part of glue in 25 parts of water, and the plaster prisms soaked in them for 5 minutes, then dried in the air. Each is then placed on a horizontal iron ring in such a position as to form its diameter, and from its center is suspended a pan in which weights are placed until it breaks. The strain it can withstand is proportional to the adhesive power of the glue.

Passing Events.

We have had rather a phenomenal week in these latitudes. Heavy rains, hail, strong winds and sunshine, make up a varied programme, and when we add two earthquakes and thunder and lightning, we began to think the "climate is changing." The lightning knocked down a few electric light wire poles on the Oakland mole, which has set people wondering whether lightning is to be one of the regular features of our climate hereafter.

Storms still continue in the mountain regions, and, although signs of spring assert themselves, winter has still a strong grip in the higher altitude.

Miners and prospectors are busy in many parts of the country preparing to go to the new Idaho mines, and hundreds are now on the way thither.

The Cœur d'Alene miner has quite an original plan for bulling his mines. He shows the new arrival a piece of quartz, and asks him if he can see gold in it. When the tenderfoot says he can see no gold the miner puts a pistol to his nose and again asks him whether he can see gold, and the tenderfoot sweats the rock is alive with gold. In the Spring it will be necessary to sell some of the claims in the same way.

The proposed tunnel on the Cascade division of the Northern Pacific will be 16,600 feet long, 2,400 feet above sea level, and will cost \$3,000,000.

Technical Society of the Pacific Coast.

In the MINING AND SCIENTIFIC PRESS of the 8th inst. was announced the proposed formation of a technical association in this city. A number of gentlemen connected with engineering and kindred professions, who have discussed the subject, have determined to organize a society having for its object the encouragement of social intercourse among men of practical science, the advancement of technical professions, and the establishment of a central point of reference and union for its members. Among the means to be employed in obtaining these ends will be periodical meetings for the reading and discussion of professional papers, and the formation of subordinate clubs of the different branches of the profession. The proceedings of the Society are to be published. Civil, military, mining and mechanical engineers, architects, chemists, geologists, electricians and other persons who by profession are interested in the advancement of practical science will be eligible for admission.

It is proposed to form subordinate clubs like the "sections" in purely scientific societies; each club to act, in a manner, independent, as far as its own affairs are concerned. The usual officers of the Society will be chosen, and each club will have its separate officers also. A board of directors is to manage the affairs of the Society, and have committees on finance and "executive business" to carry on the work. The executive committee is to have supervision of the room, printing, and of a library in case one is created; it will decide also as to the admission or non-admission of any subject for a lecture to be delivered before the Society, and the publication of such letters or papers as may be presented to it.

The permanent place of business is to be this city. Provision is made for honorary members, who will have the usual privileges accorded to such. They are only to be chosen from gentlemen of acknowledged eminence in some branch of the technical professions and science.

As to becoming members, applications for admission to the Society must be endorsed by at least three members, who testify that they personally know the candidate, and that he is worthy of acceptance. The application for membership must contain a statement, over the candidate's own signature, of his age, residence, nature and term of professional service, and that he will conform to the requirements of membership if elected. The Board of Directors pass upon the application; but if a ballot is demanded by two members, a ballot of the Society is taken, and five negative ballots exclude.

Resident members consist of all those members within 50 miles of San Francisco. As to the amount of dues, this will be regulated when the organization is perfected. The sum will be small, as there will be few expenses at first. Provision will be made for incorporating the Society. Amendments to the Constitution will only be acted upon at the annual meetings, so that the time of regular meetings will not be taken up by discussions on constitution and by-laws.

The first meeting of the Technical Society of the Pacific Coast will be held on Saturday evening, March 29th, in the reference room of the Mechanics' Institute. As this is the date of the publication of the PRESS, we will have no report of the proceedings until next week. It is sincerely to be hoped that the professional gentlemen of this city will lend aid and countenance to the new society, for which there is a good field.

The Forestry Commission have issued a circular letter asking for information concerning the effect of the partial destruction of forests in California, upon the distribution of the rainfall, the amount of rainfall, the permanency of springs, the area of snow-covered lands, the melting of snow, the amount of water in the rivers and creeks, comparative frequency of floods and the value and productiveness of cultivated lands. Replies to these queries will be received by the Secretary of the Board, E. W. Townsend, No. 42 Nevada Block, San Francisco.

HYDRAULIC NOZZLE.—The defendant in the case of F. H. Fisher et al. vs. Richard Hoskin has appealed from the decision of Judge Sawyer of the United States Circuit Court to the United States Supreme Court. The judgment of Judge Sawyer was for \$16,000 damages sustained by the plaintiff for an infringement on a patent hydraulic nozzle.

Inventors and the Government.

The Patent Department of the United States government is not only self-supporting, but pays a profit of several hundred thousand dollars a year. It is supported by a direct tax on the inventors themselves, nobody else paying a cent of its expenses. It is, happily, more than any other department free of politics—not perhaps so much as ought to be, yet mere politicians do not care to have to learn technical work.

It is recognized by all that the inventors of this country have contributed more to its material progress than any other class of citizens. They have made the name of America famous all over the world. The ingenuity of our devices, the perfection of our mechanical appliances and fertility of resource shown, are widely acknowledged.

Yet Congress periodically "tinkers" with the Patent Laws of the United States, and often to the detriment of inventors. Anything which at all indicates a propensity on the part of Congress to restrict inventors' rights in any way works a hardship to them. The inventors of the country are perhaps more dependent on capital than any other class, for they are proverbially poor, and capital is always timid. The present Congress is no exception. Several bills have been brought before it to which inventors take exception. It was finally decided to form an Inventors' Association for mutual protection. A convention of inventors has been in session in Cincinnati this week. On Tuesday, at the first meeting, 2,000 delegates, representing nearly every State in the Union, were present. The afternoon session was devoted to organizing. A number of persons sent letters of excuse, among them Elisha Gray, of Harmonic Telegraph fame. Conversation with many delegates shows a strong feeling against the bills pending in Congress concerning inventions and patents, and the discussion of these will take a prominent place in the proceedings of the convention. At the night session permanent organization was effected, with James S. Zerbe, of Cincinnati, as President; one Vice-President from each State and the District of Columbia; Secretaries, Charles M. Travis, of Indiana, and J. Burleigh, of Massachusetts; Sergeant-at-Arms, John J. Gaghan, of Cincinnati.

It seems strange that such steps should be necessary on the part of so useful a class as inventors. The results of their work are felt in all branches of industry and in our households. They pay for what the Government gives them and ought to be fully protected. As soon as the full proceedings of the Inventors' Convention are at hand we shall give the results of the deliberations.

There are now before Congress three House bills and one Senate bill, which are aimed directly against property in patents, and are very obnoxious to inventors. Of the House bills two have already passed by a large majority, (one of them by 114 to 6,) and are now awaiting the concurrence of the Senate. It has been suggested that all manufacturing inventors, and those who wish to uphold the industries of the nation, should write directly to Senators, and give reasons why those bills should not become laws, without waiting for any concerted action.

Among the more recent bills introduced in Congress is one by Representative Greenleaf, which provides for the appointment of three Commissioners by the President, whose duty it shall be to examine, revise and report to Congress upon the patent laws of the United States a remedy for infringements of patents and the internal administration of the Patent Office. They shall also report such amendment to the patent system as is expedient in a single code or in drafts of separate laws.

The fire in the Seattle mine of the Oregon Improvement Company has gone beyond control. All of the east side has been walled up and it is not deemed possible to save the remainder of the mine from being consumed, as it is impracticable to isolate the fire which is raging in the solid coal on the lower side of the gangways.

ALEXANDER MACKENZIE, Superintendent of the Mount Cory mine, died at Hawthorne, Nev. He was a veteran miner of the Comstock, having for several years filled the post as Superintendent of the Utah, Sierra Nevada and other mines in Storey county.

Air Brake for Cable Cars.

It was found as soon as they began running cable cars in this city that the ordinary brakes on the wheels were not sufficient to hold the cars on steep grades when the cable was released. A track brake was devised, which clamps down on the rails and effectually holds the car. The brake-block is shod with soft wood, and is found to answer its purpose admirably. The only defect is that it does not work on both the dummy and car by the same operation. The dummy man has to ring for the conductor to put this brake on the car, so that time is lost, which, in an emergency, is quite important. The dummy man can only put on one pair of track brakes. On some roads he puts the track brakes on the car itself in operation, but not those on the dummy.

One day this week we had an opportunity of examining an air brake invented by Mr. W. W. Hanscom, and patented through the MINING AND SCIENTIFIC PRESS Patent Agency, which is designed to overcome this difficulty. This brake is applied to one of the dummies and one of the cars of the Clay Street Hill Railroad Company, and can be seen at their engine-house, corner of Leavenworth and Clay streets. The object of this brake is to provide a means whereby the brakes on both car and dummy can be operated by the gripman on the dummy without having to call or signal the conductor to put on the brakes of the car; for in many cases, in the busy streets of the city, such as the lower parts of Market, Geary and Sutter streets, the conductor's time is mostly occupied in attention to passengers, and the application of the brake on the dummy alone will not stop the train as promptly as is desired. At the time that Mr. Hanscom was engineer of the Presidio Cable Road he saw the necessity of placing the entire train brakes under the control of the gripman on the dummy, and he immediately went to work to study up what should meet the requirements covering the arrangement which he has now placed on the car and dummy of the Clay street road, at the engine-house, where it can be seen by those interested. The air cylinders for operating the brakes are placed underneath the car, and a piston-rod from each end of the cylinder takes hold of a bell crank lever, on the one end of which is fastened a wood shoe, which is forced down against the track, forming a skid or track brake. On the dummy is a similar cylinder, and connected in a similar way to the track brakes of the car. The cylinders have air pipes running to each end of the car, and provided at each end with a cock for closing the end of the pipe when the opposite end of the car is connected to the dummy, so that either end of the car may be connected to the dummy or another car may be attached to the train.

The pressure of air for operating the brakes is generated by an air pump, operated by the foot of the gripman whenever desired, no reservoir for the storage of compressed air being used. By properly proportionating the pump and cylinders the action of the brake is wonderfully prompt, and the brakes on both car and dummy are simultaneously acted upon, two seconds only being required to bring them into action. The simplicity and efficiency of Mr. Hanscom's air brake will commend itself to those who desire an additional safeguard from accident to those crossing in front of the dummy, and a more perfect control of the train than has hitherto been possible.

CONSIDERABLE excitement prevails at Heron station, on the Northern Pacific line, and vicinity, over a recent discovery of gold near the point mentioned. A party of men engaged in opening a trail through to the Cœur d'Alene mine accidentally discovered gold in the sand one morning at a place where they had camped. A number of claims have been staked off, and people have commenced flocking to the new discovery. Two quartz ledges were discovered near the camp, which greatly augments the excitement.

IN crosscuts Nos. 1 and 2, on the 3100-foot level of the Union Consolidated mine, on the Comstock, the diamond drill was advanced through the water belt, and pipes and cocks put in, by means of which the water may be drawn off as it can be taken. Managed in this way, there can be no trouble with the water.

A NOTED English authority, speaking of copper, says: "From the reports of several companies, lately issued, it would appear that the present range of prices must approximate very closely to the cost of production at several mines which produce large quantities of copper."

The Victor Rotary Tricycle.

There is a certain fascination for mankind in any mechanism by which they can apply their muscular power so as to progress more rapidly than by walking or running. This is well shown by the many attempts to perfect flying machines, and the great expenditure of money in this direction, to say nothing of various vehicles for traversing land or water.

But perhaps the best and most satisfactory results for the amount of power expended have been accomplished by the use of the bicycle and the tricycle. Both these vehicles are now pretty well known, but without a critical examination but few can conceive the wonderful perfection to which the manufacture has been carried.

With the wire spoke or spider wheels, rubber tires, and hollow steel tubing for the framework, the lightness and rigidity attained are something marvelous. We present herewith an engraving of one of the best tricycles that has yet been put upon the market, built by the Overman Wheel Co., of Chicopee, Mass., of which Mr. Geo. H. Strong, of Dewey & Co., is agent for this coast.

Profiting by their experience last year, the company have almost reconstructed their machine, and it now stands at the head of the machines in the market, while the price (\$160) is a long way inside that of any other first-class machine. The following are a part of the improvements that have been made:

The driving wheels have been reduced two inches in diameter, being now 48-inch, and the steering wheel has been increased from 16-inch to 18-inch. The crescent rims are lapped, milled and brazed, the spokes are direct double butt-ended, 60 to driver and 24 to steerer. The forged steel hubs retain the same 6-inch "dish," but are increased in diameter from three and a half inches to four and a half inches. A brass, nickel-plated cap fits into the recess, flush with the hub, adding greatly to its appearance and covering the ends of the spokes and nuts. The tires are seven-eighths to drivers, and three-quarters to front wheel, of red moulded Para rubber, compressed into the rims by the patented process of this company in such a way that they will not come out, though by the application of heat they can be removed, if necessary, to replace a broken spoke or for any other reason. The frame is a model of gracefulness, as will be seen by the illustration. It is of wellless steel tubing, one and one-eighth inches in diameter, extending from side to side in one piece. The backbone of the small wheel is securely brazed to the end of the loop, and is one and a quarter inches in diameter, tapering to the neck. The frame is much higher from the ground than the one of last year, so that there is no danger of striking anything in the road, while the fact that the loop is in one piece adds materially to its strength and somewhat to its lightness. The foot rest, with corrugated rubber, is fastened to the frame at the end of the loop in a secure manner, and can be used for mounting, and will not rattle. The head is of the Stanley pattern, with four and a half inch centers. A spring top oil feeder is placed at the top, and the whole is covered with a brass, nickel-plated dust guard. The steering is completely changed. The arm is placed at the bottom instead of at the top of the head. The steering rod is fastened to the arm with a coned screw bolt so that wear can be taken up and rattle absolutely prevented. The rack and pinion steering has been discarded, and a neat, plain disk or drum, to which is fastened two phosphor bronze ribbons, are used instead. The annexed illustration will show their method of action. That they are smoother and more even in their action than the rack and pinion we can testify, while their durability has been thoroughly tested, not only on the machine, but in the works. They were fitted to the machines ridden in the Springfield races last fall, and have been used more or less ever since. It is claimed for this steering that there is no lost motion, no perceptible wear, no rattle, no dirty gear, the same evenness of action the entire length of the steering, and nothing to catch and soil the dresses of ladies. The plain bearings, which are greatly disliked by many riders, at the ends of the crank shaft and pedals, have been replaced by Bown's Eolus ball bearings, as on other parts of the machine. Those of the crank ends are placed under the frame, being out of the way, besides bringing the pedals a little more under the saddle. This will permit of a vertical action without placing the seats so far forward. The pedals are fitted with square instead of round rubbers, and a neat steel pedal slipper is in process of construction. The square rubber will give more bearing surface, and can be turned at the proper angle to fit the curve of the foot. The seat rod, steering and purchase handle rods, are adjusted with a cam bolt. The band holds are of white celluloid, as last year, but are sunk into the handle in a somewhat neater way. The hand brake is a push lever working on a segmental rack in such a manner that it can be left at the desired point. If preferred, the ordinary lever will be fitted in its place. In view of the fact that many would-be tricyclists have no suitable place to store a three-wheeler of this pattern except by taking it through a narrow doorway, which has hitherto been impossible, the Victor is fitted with a

patent cut-off axle, by which the right-hand wheel and a piece of the axle can be removed, rendering the machine narrow enough to be passed through an ordinary doorway. The method of attachment, consists in brief, of a coned end, a square shoulder, and a threaded sleeve. The strength of the attachment has been tested thoroughly it being proved that the axle is strongest at the cut-off. It has been in use over six months with satisfactory results. The differential gear is substantially the same, but is more carefully made, the gears are all of cut steel. The trail rod is more securely fastened than formerly, being a weldless steel tube screwed into a threaded socket, the brace being put through a split lug and held with a headed bolt.

The machine is finished in plain black-polished Harrington's enamel, with a few parts nickel-plated. It is fitted with the cradle spring, adjustable Victor long-distance saddle, suitable dress and mud guards, and provided with the necessary wrenches and oil cans. Total weight, about

THE VICTOR ROTARY TRICYCLE.

ninety pounds. Notwithstanding the great increased cost of manufacture, the new Victor is placed on the market at the same price as last year's machine, viz., \$160. These machines can be ridden equally well by gentlemen, ladies or children being adjustable to suit almost any size. Besides the amusement thus afforded, they are useful in the way of business. We know of many which are used every day in going from place to place on business or errands. They must not be tied, eat nothing, and when the rider is experienced, will travel any long distance as fast as one cares to drive a horse for the same distance.

A BULLION REFINING CONTRACT.—The Castle Dome Mining and Smelting Company bring suit in the Superior Court to recover \$30,000 damages from the Enterprise Mining and Irri-

Fig. 2.

McLEAN'S IMPROVED ELASTIC TRUSS.

gating Company for an alleged breach of contract made on the 7th of January, whereunder defendant agreed to send by rail to plaintiff's reduction works at Melrose, for refining and separating all the bullion produced at its furnaces at Eureka for one year, and pay for the work \$30 a ton, less certain rebate. That during January defendant delivered six car loads of bullion at Melrose, aggregating about 74 tons, which was assayed, and defendant drew draft for \$6,500, which plaintiff paid. On February 7th, defendant repudiated the contract, wherefore plaintiff claimed damages as above stated.

It is said that the Lost River country needs only the proper development to show immense mineral wealth, and place the name of her mines among the best in Idaho. It is expected that 600 men will go into that region from different parts of the Territory within the next month.

E. M. COOPER has been appointed General Superintendent of Wells, Fargo & Co's Express for the Western department, which embraces all the lines west of the Rocky mountains, including those in Texas, Louisiana and Mexico, with headquarters at San Francisco.

An Improved Surgical Appliance.

Among the many things for which we of this generation should be thankful are the improvements in anatomical implements. A great deal of ingenuity and inventive talent has been expended on this class of appliances. Many of the ills that flesh is heir to, happening to a man 50 years or so ago, had to be borne in pain and suffering, which now are quickly relieved or entirely cured by suitable appliances invented by men who have made a specialty of such things. One of the most common, perhaps, of the afflictions with which mankind is visited is rupture. This, by medical men called hernia, is the protrusion of some portion of the bowels, or of the viscera usually contained in the abdomen, through any part of

placed a leather packing, upon which the ball works, and prevents any friction or harshness by metal coming in contact with metal.

By this construction it will be seen that the pad will easily move to any point of a circle, and readily adjust itself to any surface or action of the body, and with the least possible pain or inconvenience to the sufferer. In order to obtain a greater or less pressure of the pad on the ruptured parts, the screw coupling in which the ball works is adjustable so as to relieve or increase the pressure of the ball on the coiled spring and pad. Once fixed with the required pressure, the implement is perfectly self-adjusting, and, while keeping a constant pressure, is at the same time elastic. In fact, so constant and regular is the pressure that it is claimed to be not a mere support, but a radical cure for the complaint for which it is intended. Alfred A. McLean, the inventor of this I. X. L. Truss, has in his possession the written endorsement of very many surgeons and physicians as to the utility of his invention. He has also several gold medals which have been awarded to the device. It is worn by a great many persons, and in the four years it has been in use is claimed to have made many hundred cures.

Cœur d'Alene Mines.

Although hundreds of miners have been gathering along the convenient places to start for the new Idaho placers, comparatively few have gone into the mines so far. Within the next three or four weeks, however, the great "rush" will take place. The men have been told to wait until April, and the opening of the month they will start. Just now many very absurd stories of the new region are being circulated. The transportation companies, of course, are helping the boom. A circular issued by the N. P. R. R., for instance, contains the following paragraph:

"There is no one than enough for all who come. The minerals consist of silver, tellurium and free milling gold. One hundred dollars per man per day are being taken out of the rim rock of the gulches, while in gulches \$25 to \$40 per man per day are being panned out. The claims are all very rich. Wherever the hedgerock has been uncovered, beautiful, rich dust has been scooped up by the lucky owners. On Pritchard creek can be seen valuable placer claims that have been opened, and not in a single instance has the work of development been advanced without a correspondingly rich return in bright, free gold quartz."

Men who go into that country ought to see that they are pretty well fixed for funds so as to get out if necessary. There is little chance that one in ten of the men who go will strike it. Anyone who has ever been to one of these excitements knows what a crowd of dead-broke men there is at such places. And to be broke where there are hundreds in the same fix is not a comfortable experience. The men already in the camp can do little as yet on account of the deep snow. And it is doubtful if there will be much chance for work for a month or so yet to come. Good outfits are needed in so inhospitable a country and any miner who goes ought to try and keep by him a stake to get away with in case of disappointment.

One of the ways of booming the country is in exhibiting rich nuggets of gold. It will amuse many to know that numbers of these rich specimens which advertise the new region, come from California, and the old mining State is utilized in advertising the new mines. How this is done is told in the Salt Lake Chronicle.

A reporter this morning met a wholesale merchant of San Francisco, who is the owner of one of the most complete cabinet of ore specimens on the coast, and a light heretofore unthought of was instituted into the Cœur d'Alene question. He said to the reporter: I had in my cabinet about sixteen ounces of free gold quartz specimens from Amador county, which I had bought at from \$5 to \$10 an ounce. While in San Francisco the last time a Kearny street broker came to me with a proposition to purchase my specimens, and offered me \$30 an ounce for them. The offer looked so large that I was induced to ask him what he could do with them and get his money back, after paying that figure. He produced a letter from a reliable man of Portland, Oregon—whose name I have forgotten, but who owns claims in the new district—authorizing him to buy up the best specimens of free gold quartz he could find, and send them to him at Portland. The Portland man agreed to pay \$40 per ounce upon receipt of the specimens. Well, I sold sixteen ounces at \$30, and received his check for \$480. I also learned from the letter that most of these specimens were to be sent to Spokane and railroad points near the new district, and be exhibited as the productions of the Cœur d'Alene District. The fact in the case is simply this—they haven't got any specimens out of the new district worth showing, and to keep up the boom they were compelled to resort to such measures and trades as the one they made with the pawn broker of San Francisco. I have learned that he is still engaged in buying the best specimens and sending them to parties near the Cœur d'Alene.

the walls of that cavity. Unless the skin is wounded from without, the rupture remains covered by it, and by certain tissues which lie beneath it at the points where the accident usually occurs, these points being at those portions of the walls which are naturally thinner and weaker than others, or at which there are openings, naturally, for the passage of blood vessels. Many forms of trusses have been devised to cure the complaint, and a good deal of ingenuity has been displayed. It has been found, however, exceedingly difficult to construct one which is self-adjusting, elastic and constant in its operation, which would not at the same time annoy the wearers. The engravings on this page show a form in successful use, in-

McLEAN'S IMPROVED ELASTIC TRUSS.

vented and patented by Alfred A. McLean, of this city, and called the I. X. L. Elastic Truss.

The principal feature of the invention is the combination and construction of the peculiar devices for supporting the adjustable pad, and for varying the pressure of the same on the parts to be supported. The pad is recessed to receive a screw coupling plate, and also a still deeper recess in which a coiled spring rests. The plate is held to its seat around the upper recess of the pad by screws. Fig. 1 of the engravings is a view of the truss pad and supporting strap. Fig. 2 is a side elevation of the pad and the devices for connecting it with the belt, and Fig. 3 a view, partly in section, of the same parts disconnected.

To the end of the leather strap is connected the ball and socket, the end of the strap being held between two plates of metal, a screw going through all and holding the ball rigidly. The socket receives the ball previous to its being fixed by the screw. On the coiled spring is

Tungsten.

Sources.

The element tungsten has the general characteristics of a metal, but it is also capable of acting as a non-metallic element and can form an acid—tungstic acid. It is in this role that it is always found in nature, as the tungstic acid salt of iron, manganese, calcium, or lead. These tungstates are rare. The most abundant is wolfram, a mixture of tungstates of iron and manganese in varying proportions. The tungstate of iron may replace the manganese almost entirely, when the mineral receives the name ferberite; or the manganese may replace all the iron, giving the mineral hubnerite. Besides these, scheelite the tungstate of calcium; scheelite, tungstate of lead; and wolfram ocher, the anhydrous acid itself, are found in small quantities. Wolfram is found in the United States at Charles Lake's mine, Munroe, Connecticut; at Trumbull, in the same State; and at Blue Hill bay, Maine, on Camdage farm. Although the deposits are never very extensive, an attempt has been made to work the mines in these localities, but the ore has not proved rich enough, and at present no wolfram is mined in the United States. Wolfram also occurs at the Flowe mine, in Mecklenburg county, North Carolina; in Missouri near Mine La Motte, in Saint Francis county, near the Saint Francis river; and in the Mammoth mining district, Nevada.

Value.

Wolfram usually contains from 35 to 55 per cent. tungstic acid, and is worth about 10 cents per pound, or \$80 to \$100 per ton, in Germany. It is subject to an import duty of 20 per cent. ad valorem. The price has been rising slowly during the past year or two, not however from any marked increase in the demand. Metallic tungsten is worth 60 to 80 cents per pound in Liverpool.

Utilization.

Tungsten holds a peculiarly uncertain position from an industrial standpoint. It has been recommended for use in many widely different industries; but thus far it has not gained extensive application, principally for two reasons: it has proved either too expensive or it has failed to yield the advantages claimed for it in particular cases. Under the former may be mentioned the projected scheme of saturating inflammable fabric with a solution of tungstate of soda to render them proof against fire; but experiments have usually drifted off to alum or some other cheap substance. Tungstate of soda is one of the many substances proposed for the prevention of boiler incrustations. Soluble tungstate are used to a limited extent in calico printing. By far the most important application of tungsten that has ever been proposed is in the manufacture of steel for certain special purposes. An extended treatise on this subject will be found in the work by J. S. Jeans, (a) of which the following is a summary:

It was shown by the Duc de Luyne, in 1844, that a feature in the so-called damask steel was that it contained tungsten. Later in 1860, F. A. Bernoulli made a series of experiments at the Royal Iron Foundry, in Berlin, on the alloys of iron and tungsten, which led him to the following conclusions: 1. By mixing tungstic oxide with turnings of gray cast iron and fusing them, the tungsten is reduced to the metallic state and cast steel is formed. 2. The carbon of the cast iron, and particularly that portion which is mechanically mixed with the iron, is consumed in reducing the oxide of tungsten, and metallic tungsten appears partly to take the place of the carbon in the steel.

There has been much dispute as to the real advantage of this replacement of carbon by tungsten. Mayer of Leoben, Styria, is assigned the credit of having first applied tungsten to the manufacture of steel on the large scale, and owing to the success which he attained, tungsten steel has been declared to be of the highest quality in respect to fineness of grain, uniformity of structure, hardness, toughness, strength, and durability; but numerous adverse opinions have followed the experiments of others. Tungsten, like carbon, appears to diminish the ductility of iron; though by melting tungsten and iron it is possible to obtain steel much harder than with carbon alone, without the danger of incurring at the same time an excessive fragility when cold or difficulties of working while hot.

For uses which require an especial degree of hardness, a steel rich in tungsten, called "special" steel, is frequently employed. Thus a fine Sheffield steel for lathe tools contained, according to an analysis made in the laboratory of the Stockholm School of Mines, 9.3 per cent. of tungsten, 0.7 per cent. silicon and only 0.6 per cent. carbon. This steel, which is used without being tempered for turning cylinders of cast iron, is of sufficient hardness to scratch glass and yet is not fragile, for great difficulty is experienced in breaking a punch bar.

The hardness communicated to iron by tungsten is not increased by tempering. Steel rich in tungsten cannot be hardened without breaking. It can only be worked cold by grinding, on account of its excessive hardness; by working hot with caution the desired form may be given to it, but steel rich in tungsten must be managed with great care to prevent its cracking, and it must be treated several times in succession before the desired form is attained. After the form is obtained by hammering hot, the steel should be hammered with quick light

blows nearly cold before it is allowed to cool gradually.

In order to produce tungsten steel it is necessary in the first place to rid the wolfram of the impurities which it contains. According to Jacob it must in the first place be roasted, then treated by diluted acid, and finally washed with water; in this manner the sulphur and arsenic are eliminated. After being dried the residuum is raised to a strong heat in crucibles lined with damp charcoal, the tungstic acid is reduced to the metallic state, and a compound is formed containing iron and manganese. The product thus obtained is of a dark color and great density. From 5 to 25 per cent. is added to the steel, according to the proportion of tungsten desired.

To produce Bessemer steel containing tungsten Le Guen adds to the molten metal, when the operation is finished, some pig containing tungsten, also in the liquid state. This pig is prepared from a mixture of 90 per cent. wolfram and 10 per cent. of lime with tar. According to Le Guen, the tungsten increases the hardness of the metal, and up to a certain point, its tenacity also. If, on the other hand, the proportion of tungsten becomes rather high, the strength diminishes.

Musket has obtained a patent for producing tungsten steel by mixing finely pulverized wolfram with an equal weight of melted pitch, after which the mixture is run out on a dry stone slab, and is added in certain proportions to crucible steel. Musket's "special" steel made in this way is remarkable for its hardness and strength. This class of steel is manufactured in Germany at the works of Wundt & Co., at Buckaw, near Magdeburg, in Prussia; and in Hanover at Uslar on Solling. The magnets used at Siemens' telegraphic works in Berlin are also said to be made at Mosabit of this steel. Its qualities are very different from those of ordinary steel, as although when annealed it is so hard as to resist the best files, it becomes soft when chilled, and presents an exterior full of cracks, for which reasons it must not be hardened. At a red heat it is malleable and is easily worked, but all tools made of it must be brought into shape by the hammer at once, and finished if necessary under the grindstone, as the file will not touch it afterwards. Tools of tungsten steel in use for planing and other machines at the Engine Works of Knoevenagel, in Hanover, are reported to stand longer than those made of the best Sheffield cast steel.

A species of steel invented by H. A. Levallois, of Paris, has been patented in England. This is said to be an alloy containing tungsten and nickel in various proportions, and it is claimed to be less liable to oxidize or rust than ordinary steel.

C. W. L. Bierman, of Hanover, manufactures alloys of cast iron and steel containing from 20 to 50 per cent. of tungsten, and from 1½ to 6 per cent. of manganese, in ingots, which are sold for mixing with (and so introducing any desired percentage of tungsten into) iron or steel.

Experiments with tungsten steel have been made at Park's works, and at several establishments in Pittsburgh, but as yet it has not assumed industrial proportions in the United States. It does not seem probable that it will become a rival of chrome steel.

GOLD SHIPMENTS ABROAD.—Mr. A. S. Hatch, President of the New York Stock Exchange, says: "I do not think the export of gold at the present time a matter of any serious consequence, or that it should cause any agitation or alarm. Our reserve of gold in this country now is so large that we could readily spare \$40,000,000 or \$50,000,000 without any noticeable effect being necessarily produced. The only way in which evil can result from it would be by speculators or by the press magnifying its importance and creating alarm on the subject, which might lead to large hoarding of gold in this country. I do not think, however, that this is likely to take place, because the American public are reasonably intelligent, and are not likely to be frightened out of their wits because we, in the natural course of commerce, ship a few millions of gold. On the other hand, I think the impression which will be made abroad by the fact becoming apparent that when occasion requires we can ship gold without any disturbance of financial affairs in this country will have a tendency to increase confidence abroad in our wealth and stability and in the value of our securities. I have no idea that the shipments will reach a magnitude which need cause the slightest anxiety or disturbance. We have over \$600,000,000 of gold in the country. The shipment of even \$100,000,000 cannot injure us if it is regarded, as it should be, as the natural result of interchange of commerce between nations. Harm only could result from excitement, and, as I have said, I think the American people are too well informed to see the matter in any but its proper light."

HOW TO ADVERTISE A MINE.—The following is taken from an Arizona paper, and shows the enterprise of a man who wants to sell a mine: Fifteen hundred dollars—Hi, Jamie! Get money. Get it honestly, if you can, but get it anyhow. That's me. Union mine for sale at \$1,500. Lead, silver and gold! About four miles from Crittenden, on A. & N. M. R. R. Good road all the way; no hills. Practically inexhaustible supply of water within 100 yards. New developments. Don't ask me to write a geological essay. Come and see. All tape-line experts warned against sampling my well.

Ghouls and Body Snatchers.

There has been a startling number of grave-robbing cases reported in the newspapers of late. The sacredness of God's Acre is no protection against the ghoul who gloats in his secret and unholy calling; the family shrine where we love to lay our offering of flowers, commune with the sweet memories of our dead, and feel through urned ashes after the reality of an immortal life, possesses no sanctity in the eyes of the "resurrectionist," who makes a foul livelihood out of the decayed remains of human mortality. Social obligations, domestic sympathies, tender sentiments, inspire no respect in the bosom of the ghoul.

And yet science must not suffer; it is essential to the proper equipment and knowledge of the physician and surgeon that they be thoroughly instructed in all that pertains to the human anatomy. Operations performed on the human body without the aid of the knowledge acquired at the dissecting tables would be taken out of the realm of science and relegated to blind chance. But all this, and more that might be said in the interests of health and surgery, will not justify the spoliation of burial acres, which is not only a sin against the dead, but outrages the tenderest and holiest sensibilities of the living. The good results do not justify the unclean and hideous wrong. Science has no heart, no sentiment, no veneration. It threatens to plow up all our graveyards and heat our marble-tomb vaults into cremation furnaces to gratify a sanitary whim. The poet says the scientist would "peep and botanize over a mother's grave," but we cannot approve of its invading private property and rifling the coffin in order to obtain material for the dissecting room. It is a form of robbery that the beneficent intention cannot make allowable.

But it may be a matter of inquiry how far the severity of the law and an irrational public sentiment may have been the cause of this increase in grave robberies. When the law insures the safe and decent interment of all dead bodies claimed by relatives or friends it would seem to have paid sufficient deference to the sentiment of society. No good reason can be alleged why deceased criminals and paupers, who have been a charge upon society, and whose bodies are unclaimed for interment, may not be turned over to the medical colleges. It is the only compensation they can make for the wrong or the burden they have been. It is only the feeling of living persons and the sacredness of private property that science should be taught to respect; but the health of the living is of more consequence than the method of decomposition after death in those cases where no living person is concerned to provide interment.

The recent cases of body snatching in the vicinity of Chicago illustrates the evil results which come from an unwarranted interference of the law and public prejudices. The State law provides that in all cities and counties with a population exceeding 100,000, the Superintendent of penitentiaries, Wardens of poor-houses, Coroners and public undertakers, may deliver the unclaimed bodies of deceased persons to the medical colleges. Under the operation of this law sufficient cadavers were procured, and the scandal of grave-robbing rarely heard of. But as soon as this law was rescinded, at the behest of popular prejudice, the resurrectionists immediately resumed business. The medical schools were compelled to procure bodies; good prices were offered, and the best-guarded cemeteries became a harvest field for the midnight ghouls. So extensively has the business been carried on that an eminent Chicago physician said to a reporter of the Chicago Press, that "if the graves of those who have been buried during the past year in the different cemeteries were opened, one-half the coffins would be found empty." If such be the condition of affairs in the beautiful and well-protected cemeteries of the large cities, what must be the condition of the rural graveyards? It is evident that something must be done to stop this desecration of burial places and outraging the sensibilities of the living.

It is evident that the law that stops the supply of cadavers from the penitentiaries, poor-houses and hospitals encourages body-snatching; and if the sources of supply from the graveyard should be cut off by the vigilance of the police, there would be danger of a still greater crime against humanity, such as occurred at Avondale, near Cincinnati, the other day, becoming frequent. If dead bodies cannot be had, they will be made by the murderer's club or poison. Within the memory of men still living, a wholesale system of murdering was carried on in the cities of England and Scotland, in order to furnish subjects for the surgeon's dissecting table, and it gave a new word—"burking"—to the English language. Public opinion ought to be too well enlightened to make body-snatching necessary to scientific progress, and it is obvious that the unclaimed criminal and pauper dead of our public institutions might be made to yield an ample supply without any outrage to public decency or exposing the tender feelings of surviving relatives to a constant dread.

J. J. TAYLOR and D. H. Foote are about to establish extensive ore and sampling works at Ketchum, Idaho. This is a needed enterprise for those who want their ores sampled independently of the smelting works.

Minor Minerals of the Pacific Coast.

Notwithstanding the fact that the business of mining for the precious metals on the Pacific coast has heretofore engrossed attention to the exclusion of nearly all other metals and minerals, these latter occur in great variety and generally in great abundance. Indeed, there is hardly a mineral product of use in the manufacturing or mechanic arts or of interest to science that has been found somewhere in this region, though not always under conditions which impart to it any large present commercial value. Thus, while it has been possible to profitably work deposits of coal, copper, cinnabar sulphur, borax, and a few others, there are a variety of substances, such as mica, zinc, nickel, niter, antimony, diamonds and other precious stones, plumbago, manganese, platinum, etc., which, though justly entitled to a place among the mineral resources of the region, have as yet proved to be of little or no economic value because of their limited quantity, imperfect quality, difficulty of access, or other unfavorable conditions.

In addition to those above mentioned, the metals and minerals found in the Pacific States and Territories under conditions which give them some, and in most cases, a large present or prospective value, may be enumerated as follows: Iron, lead, salt, soda, petroleum, asphaltum, gypsum, marls, asbestos, tin, chromic iron, hydraulic cement, marble, chalk, lime, fissile slates, mineral pigments, infusorial earth, kaolin, fire and other valuable clays, alabaster, magnesia, steatite, mineral soap, alum, arsenic, emery, ochre, bismuth, tellurium, cobalt, molybdenum, etc.

Besides the deposits named elsewhere in this volume which have been worked continuously and with profit, there are some others the working of which, after a trial, had to be abandoned, labor and the other factors of production having been too dear or the home demand too limited to warrant a continuance of operations. Thus attempts to utilize the deposits of plumbago, chromic iron, fire and other clays, manganese, antimony, etc., have either wholly failed or have been continued in only a feeble and spasmodic way.

Some of these industries, after languishing or being wholly extinguished during earlier struggles for existences, having at a later period been resuscitated, have since prospered and grown into large proportions, the production of copper, borax, and petroleum furnishing notable examples of this kind. It is the case, in fact, that nearly every industry belonging to this class has at one time or another experienced seasons of great depression, owing to the prevalence of low prices for the particular product; or, as in the case of quicksilver and borax, because of a real or apprehended overproduction. Never, however, have any of these pursuits failed by reason of the inferior quality or any lack of the raw material.

But for the greater allurements presented by gold and silver mining the other mineral resources would no doubt have met with much greater development than they have done, the high prices and the instability of labor in connection with the excitements incident to gold mining having for a long time tended to prevent such development. Since the exhaustion of the more accessible surface deposits, placer operations have been on the decline, reducing in like ratio the wages of unskilled labor, and causing that class of miners to seek employment in other occupations. With this altered state of affairs mining pursuits have become more diversified, men of enterprise and means having been encouraged to experiment with a variety of the more common minerals and metals, the most of which had before been neglected or had been worked at a loss. There is reason now to believe that these efforts will meet with better results and ultimately be so extended that most of the local requirements will be supplied from home sources, with a surplus of some commodities for exportation. In the past the Pacific coast has numbered among its exports quicksilver, lead, borax, copper, and several other important substances, and the list is gradually increasing. Moreover, there is a corresponding increase in amount making itself apparent. As the country grows in population and railroad facilities are extended, mineral deposits become available which, though they have long been known to exist, have not been before utilized.

HANDY MINE.—The mine on all this coast that is located nearest an express office is that known as the Fleming of Nevada City. The tunnel runs right under the town and directly under Wells, Fargo & Co.'s office has been, and we believe still is, a rich bunch of quartz. The rock is not so deep down but that occasionally Mr. Tower, the gentlemanly agent of the Express Co., can feel the blasts that are set off in the mine in order to loosen up the quartz ledge. The perpendicular distance between the safe of the express office and the gold-bearing bunch is not over 150 feet, we believe. The gold, however, does not get up into the express to be sent away, but goes out through a tunnel and to a mill before Mr. Tower gets a chance to ship the stuff to the coin factory at San Francisco. Still the Fleming mine is handy to the express office.—*Poathill Tidings.*

Shipping Ore to Colorado.

Concerning the results of shipping ore from San Bernardino county, in this State, to Colorado, the *Calico Print* says:

During the past week or two, some person or persons started the report that Mr. H. B. Stevens of Calico had received very poor and unsatisfactory returns from the ore that he had sent recently to Pueblo, Colorado, and various were the comments among the miners in regard to the matter. As usual in such cases, the report was accepted as the truth, and many wisacrees found ample time to tell their experiences, all tending to corroborate the report.

It was our good fortune to meet Mr. H. B. Stevens on the 8th instant, and with note-book in hand, drew from him the following facts, and as we believe they are of much importance to our readers, we will add that Mr. Stevens gave us this information without any reservation, and in a very candid manner, apparently fully realizing the importance of the subject, so far as it affects the business prosperity of the camp in general. Mr. Stevens said that in regard to the report that his returns from ore shipped to Pueblo had been "unsatisfactory," that such report was false, and that on the contrary, the returns were far above his expectation, and therefore had given perfect satisfaction. On January 19, he shipped twenty sacks of ore from the Carbonate mine of Mineral Lake district, situated some twelve miles south of Bagdad station. At the time of shipment he sampled the ore as well as he was able, in a crude manner, and bringing the samples with him, had them assayed at Calico. This sample went \$72, no test being made for copper. The return he received from Pueblo was \$116 silver and 20 per cent copper, for which they gave him \$20, or one dollar for each per cent. So favorable was the result that he immediately set men at work to get out ore for shipment, and they are now hauling sufficient for a car-load to the railroad, which will be forwarded from Bagdad as soon as possible. On January the 29th he shipped one car-load of Kearsage ore from Calico from which he has received no returns, save a short note, written February 22d, acknowledging the receipt of the same, and saying that they would be able to pay him "fancy prices," meaning that they would allow him a price above their usual rate of percentage. Since then the railroad blockades have interrupted all communication. Not only have the Pueblo company been prompt in their business affairs, but also liberal in their dealings. They guarantee 90 per cent on \$100 ore; special rates on richer ores.

At the Kearsage mine at Calico of which Mr. Stevens and Mr. Robt. McCullough are the owners, they have two car-loads of assorted rock now ready for shipment to Pueblo, which will be forwarded as soon as the roads will permit; also ten tons that will be worked within a few days at the Oriental mill at Daggett. A tunnel is being run on the ledge that has reached the depth of fifty feet below the surface, and shows up at least one thousand tons of ore that will yield at least \$100 per ton. They offered this mine for sale about a month ago for \$15,000 and refused an offer of \$10,000. Now it would take \$30,000 to buy it.

This one by one are our mines placing themselves on a good footing, and adding a splinter to the lever that moves the world.

SWEDS DANES AND NORWEGIANS.—On the information of Herr August Berggren, the Swedish Consul, it is stated that there are about 6000 Norwegians and Swedes in this city; and on that of Captain Simpson, the Danish Consul, the resident Danes of San Francisco are placed at 3000. In the State there are close on to 5000 Danes, while of Norwegians and Swedes there are about 18,000 on the coast. Very many of these are men who found work on the Northern Pacific Railroad. The great rain-water State of Oregon is a favorite abiding place of the Scandinavians, while California has also unusual attractions for them. That is, unusual in comparison to the Eastern States, and mainly because the climate has none of those extremes which try his constitution in the burning summer months. The residents of lands that both border on and are within the Arctic circle dread those three scorching months, July, August and September, and during the last few years a steady stream of immigration has set in toward us from the East. There are two other regions besides the States of California and Oregon that offer special inducements to the Scandinavians, Utah being the one and Hawaii the other.

A CANDID OPINION.—T. R. Woodruff publishes a letter on the *Coeur d'Alene* mines in the *East Oregonian*, in which he says: "Last August I went up into the *Coeur d'Alene* country thoroughly equipped for prospecting, and for four months I prospected diligently throughout that section on Pritchard and Eagle creeks, the most of their tributaries and the neighboring streams and gulches, and, although I found some colors, I failed to procure, in a single instance, what could be called a paying prospect. In conclusion, I will say, with an experience of over twenty years in mining, and the knowledge I have of the *Coeur d'Alene* mines, that they are the biggest fraud and humbug of the nineteenth century, a delusion and a snare, and a good country to stay away from."

USEFUL INFORMATION.

Peculiar Wood Working.

The auger is intended primarily for making holes in wood, yet the only cutting or boring portion is the chisel tip on its lower end; and if the implement could be kept at its work and guided in its course, the gimlet screw at its point and the spiral above its cutting portion might be dispensed with, as the screw merely pulls the cutter into the work and the spiral guides the auger and elevates the chips. So the auger, deprived of these portions, becomes a rotary cutter by which straight or curved recesses of a definite width may be cut. Mortises for tenons are made with such an implement, and it is used also for many other similar purposes.

An adaptation of the circular saw is more peculiar than this. It is the cutting of a wide kerf with a thin saw; thus a saw of one-fourth of an inch thickness, or "set," cuts a score, or slot, of three-quarters of an inch or more. In appearance the saw is anything but mechanical, and at first thought the method is "sloppy" and foolish. But the result of the work is good. The effect is produced by placing a circular saw on an arbor somewhat smaller than the hole through the saw, and canting the saw to an angle by means of convex faced glands or flanges. When rotated the saw's periphery has a "wobbling" motion, so that twice in its revolution the saw cuts out of its true kerf on either side. It will be seen that if the quarter inch saw is set one-quarter of an inch out of truth on its side, it will cut one quarter of an inch on each side, making, with the primary thickness of the saw itself, a cutting width of three-quarters of an inch. This apparently crude method produces very satisfactory results. It might be supposed that such eccentricity of movement from side to side would leave very coarse score marks on each side of the cut, but the velocity of the saw's rotation compared with the feed insures perfectly clean work. One of the chief advantages of this method is that the score required to cut a wide kerf with a narrow saw by gradations is much less than to cut the full kerf at once with full wide cutters.

Drilling and Turning Glass.

Glass may be readily drilled by using a steel drill hardened, but not drawn at all, wet with spirits of turpentine. Run the drill fast and feed light. Grind the drill with a long point and plenty of clearance, and no difficulty will be experienced. The operation will be more speedy if the turpentine be saturated with camphor gum. With a hard tool thus lubricated glass can be drilled with small holes, say up to three sixteenths, about as rapidly as cast steel. A breast or row drill may be used, care being taken to hold the stock steady, so as not to break the drill.

To file glass, take a 12 inch mill file, single cut, and wet it with the above solution—turpentine saturated with camphor—and the work can be shaped as easily and almost as fast as if the material were brass.

To turn in a lathe, put a file in the tool-stock and wet with turpentine and camphor as before. To square up glass tubes, put them on a hard-wood mandrel, made by driving an iron rod with centers through a block of cherry, chestnut or soft maple, and use the flat of a single-cut file in the tool-post, wet as before. Run slow. Large holes may be rapidly cut by a tube-shaped steel tool, cut like a file on the angular surface, or with fine teeth, after the manner of a rose bit; great care, being necessary, of course, to hack up the glass fairly with lead plates or otherwise, to prevent breakage from unequal pressure. This tool does not require an extremely fast motion. Lubricated as before, neat jobs of boring and fitting glass may be made by these simple means. The whole secret is in good high steel worked low, tempered high, and wet with turpentine standing on camphor.—*American Manufacturer.*

How to Tell Good from Bad Gilding.

It may be ascertained whether gilding is genuine or not by the fact that on the latter a weak solution of protochloride of copper produces a black precipitate, which it does not on the former. In the case of gilt paper, the simplest method consists in slowly burning the paper in a bright flame that gives out no smoke; in the incinerated remains of good gilt paper there are traces of the gold left behind, which are quite perceptible to the naked eye, in the shape of glittering spots while base metal on paper oxidizes in burning, and leaves nothing but a lot of red spots behind. This method, however, is scarcely accurate enough; a very much safer test is to be found in the use of mercury, either in metallic shape or in solution of salts of mercury. The former test is performed by putting a few drops of pure quicksilver on the gilt article, and either rubbing it in or slightly heating it. If the gilding be genuine, though ever so thin, the mercury combines itself with it, producing white spots on the surface. This does not occur in the case of sham gilding, and in rubbing mercury in no change of color whatever can be noticed. Another test consists in the application of a watery solution of nitrate of mercury. In this case the exact opposite takes place as in the former,

for genuine gilding remains intact, while a "dummy" at once takes a white color when brought in contact with the precipitate of mercury.

A NEW METHOD OF FINISHING WOOD-WORK: Many processes have of late been applied to the finishing of wood-work, such as staining in various colors, fumigating and other methods. A new finish is now cultivated in the Continental market, and is known as the Kubeuick process. It is used for giving a metallic surface to wood, and consists in first immersing the wood in a bath of caustic alkaline lye, in which it is allowed to remain for two or three days, according to the degree of permeability of the wood, at a temperature of 167° to 194° F. From this bath the wood passes to another of hydro-sulphate of calcium, to which is added, after 24 or 36 hours, a concentrated solution of sulphur. Here it remains for about 48 hours at a temperature of 95° to 122° F., and, lastly, for from 30 to 50 hours the wood is immersed in a solution of acetate of lead at the same temperature. The timber thus pickled is allowed to dry, when it is said to be susceptible, after burnishing, of a high polish and even metallic luster, which is more brilliant if the surfaces of the wood have been previously rubbed with lead, tin or zinc plates, and then polished with a glass or porcelain burnisher. Treated in this way the wood may assume the appearance of a metallic mirror, being also hard and very strong.

AN EXPLOSIVE MADE FROM COAL TAR.—German ingenuity has produced another derivative from coal tar in the shape of an explosive for mining purposes or fire-arms. This resultant is a mixture of saltpeter, chlorate of potash and a solid hydrocarbon, the latter being paraffine, asphaltum or pitch. The solid ingredients are powdered and intimately mixed, and the mass is then treated with a liquid volatile hydrocarbon, such as benzine or gasoline, which dissolves the solid hydrocarbon and forms the whole into a plastic body. This cake is then rolled into sheets and hardened by allowing the liquid solvent to evaporate, the product being afterward broken up into grains of any desired size, like ordinary gunpowder. By this method of dissolving the hydrocarbon before or after admixture with the salts, the grains become coated after drying with a water-proof surface or varnish. The new compound is only an explosive when confined in a close space. It possesses the same density as gunpowder, and is very hard.

GLYCERINE OR WHETSTONES.—Instead of oil, which thickens and makes whetstones dirty, a mixture of glycerine and alcohol issued by many. The proportions of the mixture vary according to the instrument operated upon. An article with a large surface, a razor, for instance, sharpens best with a limpid liquid, as three parts of glycerine to one of alcohol.

GOOD HEALTH.

A New Food.

M. Moride has introduced a new kind of food to the French Academy. It is prepared by working into a pulp raw meat previously deprived of bone and tendon, and then mixing this with bread or farinaceous substances, which absorb the watery constituents of the meat and thus form a paste. This paste is dried in air or a mild stove, and then ground and sifted. The powder is gray or yellowish, according to the material and proportions, and is said to have an agreeable flavor. By mixing this with albumen, fats or gummed water, it is made into cakes or cylinders, to be afterward used for soups, sauces, etc. It will keep for an indefinite length of time when thus prepared, provided it is not moistened. M. Moride affirms that this is more assimilable than cooked meat. He gives it the name of "Nutricine," and proposes, among other applications of his invention, to preserve the refuse of the slaughter houses, the flesh of horses, blood, etc., for the feeding of dogs, pigs, ducks and fowls. In this he is anticipated by the English manufacturers of the "meat biscuits" that have long been used for feeding dogs, fowls, etc.

If the materials could be guaranteed, this mode of combining flour with meat to produce a portable, unchanging, nutritious food, requiring the minimum of cooking, would be of incalculable utility, especially if the act of union of the meat with the farinaceous matter effects an incipient decomposition or loosening of the original bonds of chemical union that renders the compound more easy of digestion and assimilation than were either of the original materials. M. Moride seems to suppose that something of this kind occurs, and there are good analogies in support of such a theory. The soldier, the sailor or the workman away from home, or the clerk or merchant at his office, might thus carry a penny cylinder, which, merely moistened with a little hot water, would include all the material of soup, entree, joint, vegetables, bread and cheese.

CAUTION TO FAT PEOPLE.—The following "Caution to Fat Men," from the *St. James Gazette*, is going the rounds of the press: "Fat men resolutely bent on bringing down their weight should read the report of Dr. Vulpian, on the causes of the digestive disturbance

which was the origin of the malady to which the Comte de Chambord succumbed. The Count, it must be remembered, was, in his early days, thrown from a horse, with the twofold result of laming him and destroying his nerve. He was unable in consequence either to walk or to ride; and, having exhibited a taste and even a passion for hunting, he caused rides to be cut in the forest of Frohsdorf, along which, driven in a carriage, he was accustomed to pursue his game. This, during the last few years of his life, was the only form in which he took exercise, and as a natural consequence, he became inordinately stout. He had recourse to Bantingism, and the dietary system he adopted had the effect—as he first and Dr. Vulpian afterward believed—of bringing about the condition of stomach which at last killed him. 'Some four or five years ago,' says Dr. Vulpian's report, 'the Count, urged by a desire to diminish his stoutness, submitted himself to the Banting system in all its rigor, and in a few months had lost nearly fifty pounds of his weight. This rapid emaciation had produced weakness and at the same time perhaps digestive troubles, and several people have told me that that was the case, and have even traced to the same date the first attack of the malady.' The immediate effects of severe Bantingism seemed to have passed off, but later on the Count was twice attacked by acute indigestion, and was obliged to subject himself to severe treatment on each occasion."

THE VALUE OF SUGAR AS AN ARTICLE OF DIET.—Dutroche calls sugar the "most perfect alimentary substance in Nature." Dr. Rush says sugar affords the greatest quantity of nourishment in a given quantity of matter of any substance in nature. Sir John Pringle tells us that the plague has never been known to visit any country where sugar composed a material part of diet of the inhabitants. Dr. Cullen is of the opinion that the frequency of malignant fevers of all kinds has been lessened by the use of sugar. The celebrated Tronchena recommended sweetened water for almost every malady. Dr. Frothergill was very anxious that the price of sugar should be so far reduced as to make it accessible to the common people. Dr. Franklin had taken large quantities of blackberry jam for relief from pains of the stone, but discovered at length that the sanitary property resided wholly in the sugar. Sugar has been found to be an antidote to the poison of verdigris, if taken speedily and in abundance. It has been said that sugar injures the teeth, but this opinion does not deserve a serious reflection. The plentiful use of sugar is one of the best preventives of intestinal diseases in children. Nature seems to have implanted a love for this aliment in young people, as if it were on purpose to defend them from such disorders.

MORE AIR.—Those who have been housed for the winter, scarcely securing a breath of pure air for months, should, at its close, breathe as much of the spring air as possible, as one of the most important means of purifying the blood. All nature is active in the spring—vitalized, putting on new life and more graceful attire; and it is the privilege of debilitated women, nearly worn out housekeepers, the victims of "nervous prostration"—a new disease, or one with a fashionable name, meaning something or nothing—it is the right of all such to rally with the return of spring, and to do so by breathing more of God's pure air—free to all creatures, and as life-giving as free! These exhausted women have a right to throw off some of the drudgery of kitchen toils—some if not much of this is needless—and enjoy the air and sun, while managng a flower-garden. Women have "rights," and among them is that of taking better care of their health, which implies a little more leisure, less of the burdens, cares and anxieties of domestic life. This she can have by the adoption of plain, simple and sensible habits of living and dress.—*City and Country.*

A CURE FOR DRUNKENNESS.—There is a prescription in use in England for the cure of drunkenness, by which thousands are said to have been enabled to recover themselves. The receipt came into notoriety by the efforts of Mr. John Vieve Hall, commander of the *Great Eastern* steamship. He had fallen into such habitual drunkenness that his most earnest efforts to reclaim himself proved unavailing. At last he sought the advice of an eminent physician, which he followed faithfully for several months, and at the end of that time he had lost all desire for liquor, although he had been for many years led captive by a most debasing appetite. The recipe, which he afterwards published, and by which so many other drunkards have been assisted to reform, is as follows: Sulphate of iron, 20 grains; magnesia, 40 grains; peppermint, 44 grains; spirits of nutmeg, 4 drams. Dose, one tablespoonful twice a day.

LIMBS OF UNEQUAL LENGTH.—A writer in *Nature*, a member of the Royal College of Surgeons, mentions that, of 70 well authenticated skeletons he examined, the lower limbs were equal in length in only 7 instances, the right limb being lower in 23, and the left limb in 38 cases. It is claimed that this will have the effect, where persons walk without knowing the direction from their surroundings, to make their step longer with one limb than the other, and thus travel in a circle, as people so frequently do when they get lost. In most of the skeletons above referred to the right arm was longer than the left.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Alpine.

LEAD AND SILVER.—Monitor *Argus*, March 15: J. P. Ray is reported to have developed some very rich feeders, bearing lead and silver, in the Last Resort. From developments made recently in the mines about Monitor, we have every reason to believe that some time in future some rich strikes will be made in lead and silver ores.

Amador.

ST. JULIAN.—Amador *Ledger*, March 22: We paid a visit to this quartz mine at Middle Bar on Saturday. The one stamp mill had just been started on a mixture of quartz and slate. It is not expected that this matter will pay anything big, but it is run through as a test to get the mill in good working order before the rich ore which they have stowed away in the tunnel is crushed. The stamp is 300 pounds in weight, and is calculated to reduce three tons per day. We entered the tunnel, the mouth of which is but a few yards from the mill. The entrance was strongly barricaded, and is always kept so when rock is not being run out. The tunnel is about 200 ft in and runs almost due north. At a point about 40 or 50 ft from the face we reached the place where the pocket of rich ore was taken out recently. The eastern wall of the tunnel showed numerous stringers of quartz from one to three inches wide, all going down with a strong easterly dip. This wall was still sprinkled with rich black ore; also the roof, and especially the floor, the latter fact leading to the conclusion that the heart of the pocket, if it has not already been taken out in excavating the tunnel, lies below rather than above the present level. From this point small veins of white and apparently barren quartz are seen on the east wall to the face. Here the vein widens to a foot or 18 inches, and plentifully freighted with sulphurets of a yellow color. Free gold is occasionally met with in the quartz taken from the face, and the hope is entertained from the indications that another pocket is not far off. All the rich ore was crushed by Tuesday night. There were about 40 sacks of it. It is impossible to tell at present how much it realized, as much of the gold is mixed with sulphurets taken from the battery and boxes, and will have to be separated by chlorination. The yield is roughly estimated from \$5,000 to \$8,000—not a bad result from three days' work with one stamp. The Middle Bar tunnel is in 700 ft, and runs through hard rock the entire distance. No timbering has been needed so far. A blower has been ordered for the purpose of driving back the smoke, as the men find it impossible to work at the head for an hour or more after each blast.

SUTTER CREEK.—Operations at the Mahoney are progressing very slowly. Mr. Morgan has got a few men employed, who are engaged principally in endeavoring to take the water out. This is a serious job, as the water has arisen nearly 400 ft, drowning one pump. The flow is so strong that very little headway is made in controlling it.

Calaveras.

ANOTHER RICH STRIKE AT SHEEP RANCH.—Calaveras *Prospect*, March 21: The town of Sheep Ranch, during the past few weeks, has been involved in an unlimited excitement, over the discovery of the famous vein at the northwest extension of the claim recorded to J. B. Hagin & Co. After the prospecting by the original locators of the claim, the property laid in idleness for several years. Recently Mr. Clary conceived the idea that by running a crosscut tunnel there would be a possibility of making a paying discovery. An Italian—Sebastian Gardella by name—was employed to do the work. Mr. Gardella is an experienced prospector and his opinions at the beginning of the work were, that the famous lode would be found and that he would claim the honors of discovery. He worked several weeks, running the tunnel during this period a distance of about 25 ft but failed to make an encouraging result. He was then ordered to suspend, but being confident of success he told his employers that he would work on and if he failed to make a discovery he asked no recompense. He then proceeded a distance of perhaps 10 ft and made the discovery of an excellent opening. He followed this for several days and began taking out some of the richest and most promising ore that has ever been seen in this section. Undoubtedly this is the extension of the quartz vein celebrated everywhere as the Sheep Ranch mine. Indications are favorable in every respect, for the development of a mine rich to an extreme, which would make the village of Sheep Ranch a revived and lively place. Perhaps in the future, that neighborhood may wear laurels and become celebrated as a second Virginia City in mineral riches.

WEST POINT.—Cor. Calaveras *Chronicle*, March 22: The San Antonio mine which was being worked by Messrs. Hunter & Clark has been closed down. The Scorpion has commenced work this week. The Wide West mine owned by H. Sterling is still being worked. Messrs. Easton & Hait, the latter being somewhat interested in the Scorpion mine are now in town.

El Dorado.

GREENWOOD.—Mountain *Democrat*, March 22: A movement is now being made in mining matters here which promises a relief from the long-continued dull times of which we have all, not without reason, been complaining. Profitable work is being done on the American Seabelt mine. This mine is owned by the Smith Bros. It is situated in American canyon, and is one of the oldest locations. It has turned out a large amount of gold in the past, and from present prospects appears to be as valuable a mine as ever. At the Spanish mine, owned by M. M. Howe, a strike has recently been made, and some parties have made arrangements with Mr. Howe so that they can work it for a term on a percentage. Some Chinamen have purchased Mr. Peterson's claim in Graveyard ravine, and are working it steadily. The Revenge Seabelt mine in Coloma canyon is being prospected by the owners with very flattering results. They are now surveying for a ditch to bring water from the El Dorado Water Co.'s canal, and contemplate putting up a quartz mill. Messrs. Hulford and Bleibtreu are busy

sluicing at the old Cederberg. A. W. Martin is at work at the adjoining mine called the New El Dorado. The want of water has retarded other mining operations in this district, which really possesses a mineral wealth that should make dull times an unknown quantity in it. Dr. Russell, of San Francisco, who has recently been testing ore from the Morrell Con. mine, with results that have astonished even the owners, has been on a visit to Greenwood, preparatory, we hope, to the introduction of his process by the erection of a furnace and works in this district. I believe the Doctor was very favorably impressed with our mining outlook. Another seabelt mine—the New Garibaldi—owned by Messrs. Ricci and Hannery, has also been brought into the line of working mines.

Mariposa.

A MINE SOLD.—Mariposa *Herald*, March 21: Last Saturday the Morning Star mine on Bear valley mountain, was bonded by its owner, Phillip Gosser, to a Mr. Rogers, of San Francisco. Two thousand dollars was paid down, and \$7,000 will be paid in six months, and \$7,000 more in twelve months. The purchase means business, and active work will begin at once. The sale was effected by James Dolan, Esq., formerly a prominent citizen of this county. E. O. Darling, Esq., has returned from San Francisco, and will take a prominent position in managing the affairs for the new owner of the mine. We congratulate Bear valley and the county on this fresh introduction of capital and enterprise.

HITE'S COVE.—G. W. Barley, representative of the Hite Gold Quartz Co., came to town last Sunday. Mr. Barley speaks enthusiastically of the future in store for mining interests in Hite's Cove and vicinity.

HORNITOS.—John Ellen, an old miner, picked up a boulder weighing 21½ pounds on his gravel claim in the vicinity of Mr. Henry Morrison's old place, now owned by Stockton & Buffum, and sold it to-day, just as he found it, for \$500 to Bernard Vriberne, of Indian gulch. Mr. Vriberne refuses \$1,000 for the rock now. He will take it to Europe. Rafael Farrias picked up a nugget last week which weighed \$44. John McColloch, an old resident and miner, and a former owner of the Brooks mine, is in town. He says things have changed since he left here twelve years ago.

Mono.

A DRAFT.—Free Press, March 19: Quite a force of miners was drafted from the Standard mine yesterday, resulting in considerable excitement. The engineers and brakemen were put on twelve hour shifts instead of eight-hour shifts. It is the intention to shut down the Standard-Bulwer mine in a day or two. This is the result of a marked falling off in the value of the ore. The old Standard mine will be kept steadily running as usual, and at the same time prospecting work will be kept up in the mine. The latter is likely to result in new discoveries most any time. Many feared the draft would result disastrously to other stocks than the Standard, but such did not prove to be the case. There is no reason why Bodie, Bulwer or Mono should be affected by the Standard, as each mine depends upon its individual value. Bodie was looking well yesterday, and although a considerable amount of stock was sold from here it did not fall off except to a comparatively small amount.

Nevada.

DITCHES BEING REPAIRED.—Nevada *Transcript*, March 19: All the ditches in the upper part of the county are being put in good condition but no water from there is being used for hydraulic purposes. The work now being done gives employment to quite a number of men. The water companies intend to keep their property in good condition, as Sawyer's decision may be reversed, or something else may take place whereby the waters can be utilized.

MAGENTA MINE.—Greenville *Union*, March 23: The Magenta Mining Company has levied a small assessment. This was found necessary from the fact that the Co. has been at work for six months in the work of development, and the working fund raised from the sale of stock is about exhausted. There have also been some unanticipated expenses, as the cutting of a heavy stream of water on the 400 level made it necessary to put in a larger pump, and a special engine had also to be provided for hoisting purposes. The heavy body of water to contend with has prevented the opening of the 400 level, but the work has been carried forward on the 300 level, and from the north drift and the stopes above rich rock have recently been taken out. A crushing of rock from this level is now going through the Rocky Bar mill. Another lot of specimens were taken out of the 300 level on Friday, and yesterday a number of loads of fine ore were hoisted from the same. The ravine under which the lead dips has recently been flumed to carry off the surface water, and within the next ten days it is expected that the mine will be pumped dry to the bottom, when drifting on the 400 level will be resumed.

THE NORTH STAR.—Foothill *Tidings*, March 21: Steps are now being taken toward re-incorporating the North Star Mining Co. A Board of Trustees will be elected and will contain two or three members from Grass valley. It will be known in about a week hence if the negotiations pending with the Scotia Co. are to be successful. If not, the present owners must, to fulfill their agreement with the present subscribers, furnish hoisting works, machinery, etc. The gentlemen inform us that just as soon as the small balance of stock is subscribed, work will go ahead. Unless the company have \$40,000 cash subscribed for the sole purpose of re-opening the mine, they will not feel justified in proceeding, as with that amount stockholders need have no fear of assessments.

RUMORED FIND.—Foothill *Tidings*, March 21: There are a great many persons constantly prospecting on Deadman's flat, near Grass valley. This particular place has become noted for its rich deposits, and many a "pocket" has been unearthed on that famous flat. Rumor comes to town to-day that Thomas Scadden and several other young men ran into a pocket containing \$2,000 several days since, on Deadman's flat, and from the looks of the decomposed quartz there is a probability of a strike of a few thousand more.

Plumas.

GETTING READY.—Greenville *Bulletin*, March 16: A crew of men were put to work in the Arcadian mill the first of the week, getting ready for a start. It is expected that the mill will be started up about

the end of the week, as the ditch is now nearly ready for having the water turned in. All through the winter a number of men were at work in the mine, and now a large body of ore is opened up, and no doubt the proprietors will have a profitable season.

RIVERDALE.—Plumas *National*, March 18: The new machinery has been put in place, and work resumed in the Riverdale mine. The engine started up on Thursday, and is steadily lowering the water in the mine, which should be clear in a day or two. The delay has been tedious, and expensive to the owners, but they are now in hopes that everything will work favorably and if such is the case they will soon be taking out big pay.

Sierra.

THE COLUMBO MINE.—Sierra *Tribune*, March 21: In the upper level of this mine the ledge is five ft in width, and a splendid body of ore is presented to view. In the lower tunnel indications are very fair for tapping the ledge at an early date. Finer screens have been put in the mill recently, and they give much better satisfaction than those formerly in use. Last week a change was made in the superintendency of the mine, Mr. Deidesheimer being superseded in that capacity by W. H. Rodda. Mr. Rodda is an old and experienced miner. At one time he was in charge of the North Star mine at Grass valley. For the past four years he has been superintending the Summer mine in Kern county, having an eighty-stamp mill and one of the most extensive mines in the State. It was formerly the property of Senator Jones, of Nevada, but is now owned by Michaels, Friedlander & Co. Mr. Rodda is highly pleased with the present condition of the Columbo mine and its future outlook. Mr. Deidesheimer intends remaining in this vicinity, and will devote his energies toward opening up other mines in the district. Stephen Moore, who has been acting as foreman at the mine has accepted the superintendency of a mine in Tuolumne county, and will go there as soon as a suitable man can be secured to take his place. W. H. Gandy, of Trenton, N. J., a trustee, arrived at the mine last week, and will probably remain a couple of months.

Siskiyou.

THE BIG DITCH.—Yreka *Union*, March 20: The Portuguese miners of this vicinity and Hawkinsville are endeavoring to lease the Big Ditch of Mr. Edson upon the following terms: They are to clean out and repair the old ditch running on the west side of Yreka, repair or put in new flumes where needed, Mr. Edson to furnish the lumber and nails therefor, and the Portuguese to have a lease of said ditch from Willow creek down for a term of three years, and to pay \$250 per month for the water therefrom. The Portuguese estimate that it will cost about \$3,000 to put the ditch in repair, and as a remuneration for their labor and outlay, they ask that Mr. Edson allow them a rebate of \$1,000 per annum from their rents. Upon coming to town Tuesday we learn that Mr. Edson made a proposition to sell them the above-named portion of the ditch at a stipulated price, but we have been unable to learn which of the two propositions will be entertained. The lessors, at the expiration of the three years' lease, have the privilege of renewing the lease.

SAWYER'S BAR.—Messrs. J. B. Tonkin and Jas. R. Hughes have surveyed the grade for a ditch and flume to carry water on to the Ophir placer mine, situated on the south side of the river and above the mouth of White's gulch. The company mean business, and will proceed to work with a full force as soon as the weather becomes warmer and the snow melts away from a portion of the proposed grade. I hear the parties obtained a good prospect on the ground, sufficient to justify them in the undertaking. There are other bars below them which their water will command. The proprietors of the Uncle Sam are fretting. Cause—no water and an eight-stamp mill and plenty of rock. They propose, the coming season, to put an engine on the works, which will give them at least ten months' run. Their mine is considered valuable and well worth the outlay. Jimmy Kean has commenced operations on the Evening Star mine, of which he is the sole owner. He is well posted on the auriferous character of that vicinity, and will, no doubt, make it pay. That the mining outlook of the Salmon country is better now than for the last few years is the opinion of those who ought to know.

NEVADA.

AMONG THE MINES.—Eureka *Sentinel*, March 20: The Mildred mine, Secret canyon, has been leased for a term of six months. The prospect is still very encouraging in the Page & Corwin mine, Secret canyon. Tributaries are taking out quartz for flux from the Katie Ryland mine on Coy Hill. Adams Hill mines are again looking up and producing some ore of very high grade. Capt. Tuller has struck a little bonanza in the Paul Pry mine on Adams Hill, and will increase his working force of men. The Kit Carson hoisting works, which have been idle for more than a year, are crushed in with snow and partially buried. There is some very good ore being extracted from the Red Rose mine, Pinto district, which is being worked under lease. Ruby Hill miners are becoming alive to the fact that they can get good pitches in the outside mines as well as right at their own doors. Ten tons of ore were hoisted from the Silver Connor mine on Monday last, which sampled \$80 per ton, \$62 of the value being in gold. This would be a good time for the formation of local companies to work mines on a cheap assessment plan, and there are mines out of number in Eureka district that would pay such companies to look after. Would it not pay some one to get the old Roslin furnace dump to work on tribute? When that furnace was running the knowledge of smelting ores in this district was very imperfect, and it is reasonable to suppose that the dump would pay to work over. The Hamburg mine is being worked entirely by tributaries, and is yielding a large amount of ore daily. The mines in Goodwin and New York canyons, as a general thing, are looking better than for several years past. The Bald Eagle mine is yielding some very rich ore from around the old stopes. It is being worked by two men under lease. The Helena Mortimer mine is being worked by tributaries, who would not sell their patch for a trifle. It is producing better ore than for several years past. The Home Ticket mine, also worked on tribute, is producing handsomely, and one shipment of from 10 to 15 tons is being made daily. There are also tributaries, doing well in

the old Dunderberg. The Uncle Sam is being prospected from the surface, near New York canyon, at a place from which some high grade ore was taken several years ago, and the prospect is now quite encouraging. The Connolly mine, which is in a prospecting condition at present, is looking exceedingly healthy for ore in two or three places. Some ore is being extracted from the 70 level by tributaries, and during the summer it is thought that considerable activity will prevail. The Clipper mine, one of the locations of the Golden Rule Series, is being worked with good prospects, and some pay ore is in sight. A large amount of development work has been done in it since last June and it is capable of becoming one of the leading mines in that section of Eureka district. The Eureka Tunnel is being worked on a small scale; it is producing some very rich ore, but owing to financial embarrassment, the work of development is kept back, so that nothing definite can be said with regard to the future of the property. It is an important feature of the mine that tributaries are at work on the bottom level, driving towards the carbonate vein. The ground looks favorable for ore. The mine is at present in the hands of the syndicate who bought up the liens. The ore that has been accumulating on the dump since the heavy snow storms set in is now being shipped to the furnaces.

Washoe District.

SAVAGE.—Virginia *Enterprise*, March 22: The flow of water cut in the north drift on the 2600 level appears to be decreasing somewhat. In case it does not run out in due time, this water may eventually be shut back by means of a bulkhead placed across the drift. It is giving no trouble, and the only disadvantage resulting from tapping it is the cost of pumping it from the 2600 level to the Sutro tunnel.

MEXICAN.—The west crosscut on the 3100 level is out about 25 ft. The material is vein porphyry, with occasional small seams of quartz and clay.

SIERRA NEVADA.—The northeast drift on the 3700 level is still being pushed ahead. The material is unchanged. The fan station on the 2900 level, joint with Mexican and Union Con., is completed, and the fan is in and at work. As yet no prospecting is being done above the 3100 level.

UNION CON.—The fan station on the 2000 level, joint with Sierra Nevada and Mexican, is finished, and the fan is in place and running. On the 3100 level the diamond drill has been placed in east crosscut No. 3, and they are now drilling east into the wet belt.

ALTA.—The ground in the face of the east drift on the 2150 level, is working fairly well.

GOULD AND CURRY.—Good progress is making in the work of cutting out a station at the 2700 level, though the heat is very great.

BEST AND BELCHER.—Are cutting out a station on the 2700 level at the bottom of the joint Gould and Curry winze. When this station is finished a drift will be started. It is very hot at the bottom of the winze. The rock is birdseye porphyry.

CON. VIRGINIA.—The enlarging of the 2700 station has been completed, and the double hoisting engine put in place. Guides are now being put into the joint California winze from the 2700 down to the 2900 level.

HALE AND NORCROSS.—The southeast drift is making excellent progress. It is being pushed as rapidly as possible to the point where it will connect with the west drift from the Combination shaft.

UTAH.—The northeast drift on the 1750 level is out about 390 ft. It is still in porphyry containing seams of clay and streaks of quartz of a favorable appearance.

ANDES.—The appearance of the material found in the prospecting drifts is favorable, and about the usual quantity of low-grade ore is being extracted.

CROWN POINT.—The old upper levels still continue to yield well, and sufficient ore is being extracted to keep the river mills going steadily.

IMPERIAL.—Are drifting north and south on the old 600 level, where some favorable prospects are being obtained.

OPHIR.—Are still extracting ore from the 150 and 250 levels. The exploring drifts and winze (below the 250 level) are making the usual progress.

YELLOW JACKET.—Sufficient ore is being taken out to keep the mills on the Carson river running to their full capacity.

BELCHER.—The usual quantity of ore is being extracted and sent to the mills on the river for reduction.

COMBINATION SHAFT.—A station is being opened at the 2800 level, from which will be run a main west drift.

Belmont District.

PROSPECTORS WAITING.—Courier March 15: Several prospectors in this town are impatiently waiting for the snow to melt from the surrounding hills. They are anxious to search for mines of gold and silver, as they feel confident that rich mines exist in this section.

BELMONT.—Work in the Belmont mine is progressing as usual, and good ore is encountered on the 200 south level.

Cherry Creek District

STRIKE IN THE TICUP.—White Pine *News*, March 15: In the fore part of the week an important strike was made in the lower level of the Ticup mine by the force now working there for Spencer & Frank. The extent of the ore body is not yet known, but the quality is of high grade—over \$200 to the ton. After the heavy losses this firm has sustained by the late owners of this property, it would afford us pleasure to record a find of such extent as to more than repay them. We hope soon to chronicle such a result.

Eureka District.

THE SILVER CONNOR.—Eureka *Sentinel*, March 18: This mine is being worked at good profit, from 8 to 10 tons of \$100 ore being hoisted every third day. From a deposit recently opened, bright yellow carbonates, W. H. Stowell assayed an average specimen yesterday which went \$1,217.20—\$950.00 in gold and \$266.30 in silver. This body, which is yet undeveloped, and the extent of which, consequently, is not known, was struck at a depth of 300 ft in a winze from the 250 level. Considerable of the aver-

age value named—\$100 per ton—will be on the dump ready for shipment when the roads get better. The Silver Connor is a good paying property and improves with development. It does not seem unlikely that it will yet prove to be a mine of veritable bonanza.

LOCAL NOTES.—It would be singular, with the vast amount of prospecting in a large number of mines in Eureka district, this spring and summer, if some important and extensive developments are not made. M. McGarry has taken out of the Banner and has on the dump about 14 tons of \$150 ore. He is now following the vein which yields this ore on the 300 level. He will begin shipping as soon as the trails and roads are open. The news from a number of mines in the neighborhood of Eureka is better and better from day to day. We confidently anticipate quite a revival of mining in these outside properties within the next two or three months. We hear indirectly from an authentic source that several of the tubulars in the Richmond mine have splendid pitches, and that the mine generally is looking unusually well. It is intimated that something big may be expected before long. This is certainly what everybody hopes for. Everybody interested in the town of Eureka and the future of this mining district is anxious to know what the programme of the Eureka Con. Mining Company is to be. It will make a vast difference to that company and to everybody else in these regions whether or not they prospect their lower levels through the new shaft. It now seems likely that, whether or not the big mines on Ruby Hill resume their wonted life and activity, this summer, the numerous small outside mines may be depended upon for a large quantity of ore for reduction at the furnaces. The proved value of these numerous "outsiders" will be very encouraging, and may, perhaps, warm the blood in the big "insiders." It is perhaps of no ultimate disadvantage to Eureka Mining district that the leading mines on Ruby Hill have so greatly reduced the number of men employed on day's pay, for very many of these have been thus driven to the hills to prospect. These men have leased mines and are tributary in all directions in the outside mines, and in not a few instances have made promising developments.

EUREKA TUNNEL SITUATION.—Eureka Sentinel, March 21: Yesterday Lawrence Hartnett, having signified his intention to attach the real and personal property of the Eureka Tunnel Mining Co. to satisfy his judgment of \$15,000, the Sheriff was served with a notice by the purchasers of the liens, that they held the personal property and that they would hold him responsible for interference therewith.

Gold Run District.

EXAMINING MINES.—Silver-States, March 21: Some mining experts from Lander county are examining mines in Gold Run district, near Golconda.

Jefferson District.

CORA D.—Belmont Courier, March 15: We have seen a very fine specimen of ore recently taken from the Cora D. mine at Jefferson. It is by far the finest piece of ore ever extracted from any of the mines of that district. This ore carries gold and silver.

Mount Cory District.

THE FIRST BULLION SHIPMENT.—Walker Lake Bulletin, March 19: The event so eagerly and anxiously looked for has taken place. The Mount Cory Mining Co. has made its first bullion shipment. Last Saturday night Supt. McKenzie turned over to Wells, Fargo & Co., for shipment to San Francisco, fourteen bars of silver and gold bullion, weighing 1,740.85 pounds, and valued at \$20,729.90. When the fact is taken into consideration that the work so far done at the mill has mainly been experimenting and adjusting the numerous pieces of machinery, the shipment is a large one, and the parties immediately interested are justified in feeling satisfied with the result. Everything is now in fine condition, and there will be no more delays other than those of a nature to be expected in so large a mill. From this time on regular shipments will be made. The bullion is 800 fine, thus proving beyond a doubt that the leaching process is the best that could have been adopted, as it was predicted that, on account of the character of the ore, it would not be possible to get it more than 600 fine. The mine is looking well, and new developments of ore are continually being made. The base slag, consisting of copper and lead, and carrying silver, will be allowed to accumulate at the mill until there is enough to make a car load, and no shipment of less than that amount will be made. Upon the arrival of Supt. McKenzie at the express office to attend to the shipping of the bullion, S. A. Knapp, Wells, Fargo & Co.'s agent, opened a supply of Roderer, and many toasts to the mine, the mill, Mr. McKenzie, and every one concerned in the successful outcome of the company's well-directed pluck and energy. While the effect upon the financial affairs of the county will not be immediately felt, it will not be long before this will be one of the best, if not the best county in the State. Aside from the increased revenue from the bullion tax, it will enhance the value of property for taxable purposes all over this section, and encourage the work of development in many more mines that are now showing better prospect than did the Mount Cory three years ago.

Sacramento District.

HUMBOLDT QUEEN MINE.—Silver-States, March 21: J. W. Mills intends to ship several hundred tons of ore from the Humboldt Queen mine in Sacramento district, to Denver to be reduced. Alex. Wise's teams are now engaged hauling the ore from the mine to Rye Patch station, where it will be loaded on the cars.

Safford District.

NOT LIVELY.—Cor. Eureka Sentinel, March 21: Things are not very lively here just at present. Howes & Doherty are pushing the Onongada tunnel day and night. They are in now about 320 ft, and expect to run fully 50 or 60 ft further before striking the ledge. The Shield Bros. (Tom and Dan) are still extracting some good ore from the Gen. Shields. A tunnel has been run on the ledge a distance of 20 or 30 ft, and a shaft sunk 30 ft showing a well defined footwall and a ledge of ore varying from a foot to two or three ft in width. The high grade ore is identical in character with the Onongada ore, and assays \$260 per ton in silver. William Slaven, the present owner of the Key West mine, is trying to do something in the way of development in that quarter.

Taylor District.

STARTED.—White Pine News, March 15: The

new monitor which is completed, and has been started in to hoist rock. It is working in good shape, under the skillful management of Sam Snyder. A snug and comfortable building has been put over the works. Some workmen are coming from the outside already in anticipation of work being resumed on the Monitor mines in a short time.

Tuscarora District.

CONFLICTING CLAIMS.—Times-Review, March 18: There was considerable excitement in the vicinity of the Paymaster claim yesterday. It was discovered that about 1,000 ft of ground adjoining the Paymaster, which was supposed to have been covered by a prior location, was vacant. The ground was located by two different parties, and appearances indicate that title to the property will have to be established by litigation. Both parties are at work on the ground to-day at points but a short distance apart. The recent development in the Paymaster has created quite a prospecting fever in that vicinity.

NAVJO.—Times-Review, March 20: Since last report have resumed milling and work at all points in the mine.

ELKO CON.—North drift, 200-foot level, on west ledge has been extended 15 ft since last report. South drift 5 ft. It has improved both in width and character of lode materially in the past week.

GRAND PRIZE.—South crosscut, 200-foot level, extended 30 ft; total length, 153 ft. East drift on same level north lateral vein is in 18 ft in favorable vein material. West drift north lateral 300-foot level extended 13 ft. Upraise from south drift 400-foot level is carried up 31 ft. The vein looks favorable. Work has been resumed in south drift 300-foot level.

Ward District.

MILL.—Ward Kefler, March 15: The Argus mill will start up again as soon as the roads become passable. It is not a fact that the Silver Canyon mines would be driven on account of the damage done by the snowslide. Men have been put to work in the Osceola Company's mine. This don't look like abandoning the property.

White Pine District.

SILVER PLATE.—White Pine News, March 15: Mathewson Bros. are having work done upon the Silver Plate mine, below town, with quite encouraging prospects. They deserve much credit for several mining enterprises they have lately taken hold of. The Truckee mine is now being worked by day and night shifts.

A COMPANY THAT NEVER TIRES.—It is authoritatively announced that the Eberhardt Co. has decided to raise \$100,000 more to renew prospecting with burleigh drill on their Treasure Hill property. This is, we believe, the third they have raised of similar amounts. The Eberhardt people have pluck and perseverance of a high order, and the fates may yet degree a commensurate reward for their great exertions to uncover a bonanza in the Hill. How the pigmies who control our destinies, and one of the best mines in the State (the Star) sink into insignificance when compared with the men who manage the Eberhardt. The former are sneaking swindlers of the poor laborer—the latter, men of honesty, pluck, and perseverance. May they win.

ARIZONA.

MINING ECHOES.—Prescott Courier, March 15: The Groom creek mill is pulverizing gold-bearing quartz. Lynx creek is well manned by placer miners, most of whom are ground-sluicing. Copper Basin gravel, below C. C. Bean's copper field, is paying men \$3 a day. Copper Mountain smelter has made a successful run. Rich ore has been struck below the iron cap. Company will be reorganized, and push matters. Word comes from United Verde district to the effect that the Hampton mine is growing richer and bigger, and that two more 30-ton smelters will be put up in the spring.

McMILLEN NOTES.—Globe-Chronicle, March 20: The storm, which has been devastating the whole country for six weeks past, has not spared McMullen, as sixteen houses in different stages of demolition will attest; but as they were, with one exception, unoccupied, but little damage was sustained. At the mine, work is progressing as the limited supply of wood will admit. There are at present quite a number of Indians engaged in delivering wood and hay, the packing being mostly done by the squaws, who carry from 150 to 200 pounds with apparent ease. They are Lontos, and say that as soon as the rain is over they are going to the Cibicu to plant. The mill will again start up on the 12th inst., wind and weather permitting.

PECK.—Cor. Prescott Courier, March 14: The "burg" just now, presents quite a lively appearance to a stranger. It might be supposed that "old Peck" was a booming camp again, when the fact is that nearly everything has been at a standstill for several days past. More than a week ago the water coming down Wa. Eagle Gulch began seeping into the Peck mine faster than the hoisting works could take it out, and finally drove the miners out, and for five days only two engineers and two bucket tenders have been at work in the mine. The men were paid off as usual on the 5th inst., and are now taking a rest. The Tusconia mill was forced to stop Sunday for want of salt, and some of the mill men came to town. Ensign's burro train arrived via Big Bug Sunday evening with salt and groceries, so the mill will start again to-morrow, probably. For some reason, not publicly known, the Black Warrior Co., Sunday, discharged all hands but one or two. The steam hoist is getting the better of the water in the Peck, and the boys will be at work again in a few days. Evidently the Black Warrior Company have some change of operations in view, for they have recently bought the Lane & Woodsoa property, which is said to be a good mine, and talk of enlarging their mill. Men from the Silver Belt say that mine never was in a better condition for turning out ore, and the stoppage there will be only temporary. E. L. Gobin and others have re-located the Necessito claim, just below the Black Warrior mine, and are sinking on it and developing a lot of rich ore, the existence of which had not been suspected. Many assays show from 300 to 500 ozs. in silver, and some go up to 2,000 ozs. per ton in silver. Messrs. Gabel, St. Curtis and McWhorter, have discovered a big silver vein on Turkey Creek, about two miles below the Big Bug road. They have had assays of 400 ozs.

per ton. Have done but little work on account of the bad weather.

THE RICH STRIKE IN THE GROUND HOG.—Tomb Stone Epitaph, March 16: Superintendent Fisher yesterday brought in two samples of ore from the new strike in the Ground Hog. The pieces weigh 79 pounds, and carry that many dollars in silver, being rich carbonates and black metal. It comes from the face of the sixty-foot drift on the 150 level, the scene of the new strike. The ore, which can be seen at Priddyham, Macneil & Moore's, is as fine as anything ever found in the camp, and there is every indication of a large body. It is just such discoveries as this which make Tombstone's future an assured one. The main shaft of the Ground Hog is now down 200 ft, and altogether there are 800 ft of workings, which place it somewhat beyond the rank of a prospect. Not long ago the property was sold by the Schleiffel boys for \$5,000, and to-day the owners would laugh at an offer of \$100,000. It is owned principally in Pittsburg, Pa., Mr. Fisher having a large interest.

COLORADO.

IDAHO SPRING.—Gazette, March 13: Thirty-five men are to be employed on the Kitty Clyde mine. The last shipping from the Metropolitan mine was six tons of smelting ore. The Mountain King lode, in Cascade mining district, is being worked with good results. It is currently reported that the Mayflower mine will start up immediately. This is good news, as it is a pity to see valuable property that will pay closed down. Mr. Jackson is leasing on the Shafter mine and obtaining excellent ore. He is working in the old shaft, and has a pay streak of four inches that pays well. A distance of 38 ft has been reached in the adit at the east end of the Dorit lode, in Jackson mining district, and some very fine mineral is exhibited on the dump. The shipments from the Donaldson and Champion mines for February amounted to over 80 tons of smelting ore, besides mill dirt. Fifty tons of smelting and 30 tons of concentrating ore have been treated this week at the Mott Public Sampling works. On Wednesday a large shipment of ore was made from the Prigheimer's Friend, on Seaton mountain. The King Solomon mine is producing well. Mr. Moulton, of Denver, is the owner and feels encouraged.

A NEW MILL.—Colorado Miner, March 15: We learn from reliable authority, that the Grand Lake Mining and Milling Company, of Chicago and Quincy, Ill., has bought a large mill, to be put in at Gaskill. This company owns the Wolverine, one of the best developing mines in the State, and also one of the most valuable. There is now something over 2,000 tons of ore on the dump, that will mill-run about 100 ounces per ton. No stopping has yet been done, and in one place in the mine, where the main shaft was sunk to connect the upper and lower levels, a body of ore 30 ft in width was cut. The advent of this mill will insure the working of a great many mines, now lying idle for the want of a mill on the ground to treat their ores.

COLUMBIAN MOUNTAIN.—The mines on the mountain still continue to attract attention on account of the new developments and large resources of the true fissures. Recent development on the Joe Reynolds properties confirm more than ever the belief that this hill will yet disclose immense ore reserves of a high grade ore.

VULCAN.—We are glad to learn that this property is in a steadily remunerative condition. The best proof of the solidity of the mine is regular shipments of high grade ore which are made. During the month of February six tons of mineral, milling over 300 ounces silver per ton, were shipped from this property. This is considered doing well. In all the openings on the mine good paying ore is encountered.

THE GEORGETOWN TUNNEL.—Georgetown Courier, March 21: Mr. H. S. Beebe has organized a Co. of Denver capitalists for the purpose of driving a tunnel into Griffith mountain just below the Catholic Church. The Co. has bought the Leslie Norwood lode from Bunnell & Smith, upon which the tunnel is started. The Griffith and Sonora lodes have also been leased by the company. A car and track have been placed in the tunnel, and everything is now in readiness to push work ahead. The total length now projected will be 3,000 ft, which has been surveyed by Wheaton & Chase. It will cut the following localities at the distance stated: Griffith, 275 ft; Lafayette, 535 ft; Chicago, 575 ft; Lucky Dutchman, 600 ft; Star of the West, 995 ft; Cass County, 1,120 ft; Melbourne, 1,636 ft; Broad Gauge, 1,800 ft, and the Scottish Chief at 1,822 ft. Mr. Beebe has succeeded in interesting some heavy capitalists in this enterprise.

THE PAY ROCK TRAMWAY.—Excavating work for the piers of the Pay Rock tramway, from the mine to the mill, was begun last Saturday. It will be rapidly pushed until completed. According to contract it is to be finished and in operation by the first of May. The tramway is the Huson patent and is said to be the finest yet invented. It will be 2,181 ft long, and will have a capacity of carrying 60 tons every ten hours. Near the foot of the mountain the stations will be from 50 to 60 ft high. The tramway can be utilized in carrying coal, wood, etc., up to the mine, and will be so arranged as to carry passengers, who have the grit to take such a trip. This will be the sixth tramway built in Clear creek county.

IDAHO.

BAYHORSE.—Ketchum Keystone, March 15: Mr. Gilmer, of Gilmer & Salisbury came over from Bayhorse Monday. Through him we learn that the Ramshorn smelter will resume operation about the 18th. The delay in starting is explained by the fact that unexpected snow has retarded ore and bullion shipments as well as general transportation between Ketchum and Bayhorse. Mining and smelting operations in the Challis country promises to be unusually vigorous during the coming season and there is a probability of increased smelting capacity at Bayhorse. The mines are all preparing to do extensive and solid work, especially the Excelsior and Ramshorn. The entire transportation to and from that region, and in fact all its commercial traffic will have a direct influence over Wood river, and especially Ketchum, upon which point the Challis country is dependent, and by direct communication. Ketchum is the general starting point and supply depot for the entire country to the north and east.

MINING NUGGETS.—Six men are at work on the North Star mine. The Silver King mine is working

six men on development. The Elkhorn mine has 200 tons of ore at the Philadelphia smelters. Machinery for hoisting works for the Davitt and Silver King mines is now enroute. The Pride of Idaho will soon be tapped by a low tunnel about 200 ft below the surface. The Parker has recently been under the direct superintendence of Prof. Jenny. The Minnie Moore ships 35 tons of ore daily, and will soon increase that tonnage to 50. The Rebel claim, leased by W. A. Mensch, is developing mineral in profitable quantities. The Lion mine is destined to figure prominently among the properties of the Sawtooth region this season. The Vienna and Mountain King mines, at Vienna, still drive into the ore with vigor and keep the Vienna mill constantly in action. The Penobscot mine, near Bellevue, is being worked steadily for development, and a rich strike is reported to have been made recently. Reports from the Silver Star, on Big Smoky say that good ore is found wherever the vein is tapped. The snow there is about eight ft deep. The foreman will be at Ketchum soon. Nine mines out of every ten in the county are doing development work only, and this with only small crews. But most of them are acquiring a fine condition for extensive stoping in the spring. The Baltimore and Victoria mines are working light crews, but Mr. Hickey, the Supt., informs us that large bodies of ore have been developed and some unavailably extracted. Stoping will begin in real earnest about May 1st.

A GOOD RECORD.—Wood River Times, March 19: The Vienna mill is making a splendid record. Since it was started up, last July it has shipped 147 bars of fine bullion, worth an average of \$1,500 per bar, or a total of \$220,500 worth of bullion. This is a very good showing for the first eight months' run of the mill in a snow-bound country. This year the showing must, of course, be better still.

MONTANA.

GAGNON.—Inter-Mountain, March 21: The Gagnon mine has contributed to the total production of this district fully two million dollars since the time when a one-half interest in the property was transferred to Joe Rosenthal in payment of a \$30 board bill. Since then it has been in a state of almost continuous development, and has paid heavy profits, which, however, would have been immensely increased had the owners of the mine possessed any facilities for the reduction of the vast amount of ore exposed wherever the explorations were pushed. The mine never looked as well nor showed more extensive ore reserves as it does to-day. A few months ago the owner of the mine and present Supt., Col. J. C. C. Thornton, consolidated the property with that of the Colorado smelting company. The extraction of ore was afterward temporarily suspended and the sinking of the main shaft to the 600 foot station was begun. That depth was reached some weeks ago and a crosscut started south which tapped and intersected the ledge to the hanging wall. A drift is now being run west in a massive ore body and has now attained the length of 40 ft. It will be run to the west end of the claim without delay. In none of the crosscuts in the shaft is the Gagnon vein remarkable for richness, though in no instance has the ore been of too low a grade to pay. The high grade shoot of the Gagnon lies west of the shaft and in all the levels so far developed, an abundance of ore averaging \$70 per ton and running as high as \$500 has been found by the extension of drifts in that direction. In the 300, 400 and 500 levels the main crosscuts have run through an ore body which averaged ten ft in width, but the 600 foot shows a big improvement.

NEW MEXICO.

LAKE VALLEY.—Rio Grande Republican, March 12: Sierra Grande developments are most assuring. A great many eight-hour shifts are at work, keeping prospective work in the lead. Among mining men it is generally considered the part of economy to keep work well in advance, while the ore-bodies and stopes are showing up well. Dan Ferguson at present is giving his undivided attention to Sierra Grande matters, having been relieved of a part of his arduous duties by James Morehead, a young man, who has taken charge of the Sierra Bella. For the past week shipments from this mine have been both large and regular. The gallows frame for the combination shaft is nearly ready, and when finished will be one of the most substantial pieces of workmanship in the territory. The hoisting engine is dismantled, preparatory to being put in place. At present, 50 men are employed on or about the mine. The Sierra Apache continues to contribute her regular quota of rich ore. The work being mostly on the surface, it has been impeded by the weather. The mill foremanship has changed hands since my last, Charles Hellman being superseded by J. Hiscock, a mechanic of no mean ability. Pay day is on us, and a good many miners are leaving for the Cœur d'Alene in Idaho, a rich gold field that is widely advertised in the interest of the Northern Pacific railroad, or something else.

OREGON.

GENERAL NOTES.—Jacksonville Times, March 22: More rain would be advantageous to the miners. Chappel & Co. of Star Gulch are running with half a head of water and doing good work. Mr. Symons, while mining on Jackson creek, not long since picked up a nugget worth \$75. It is said that there is more snow in the mountains than usual, which will prolong the mining season some. This season promises to be a favorable one for many of the miners. All of them will be able to do something. Richard Cook has run his tunnel on Steamboat 320 ft, and expects to soon strike the rich quartz he is looking for. Logg & McDonnell of Forest creek are able to run their pipe several hours each day. They have good mines and only lack water to make a fine showing. Curtis Bros. of Jackson creek have considerable water and are able to run their pipe the greater portion of the day. They are doing well, working over old ground. A rich strike in Bybee & Co.'s mines near Waldo is reported, and it is said that several hundred dollars were taken out there in a short time. We hope the report may prove true. Miller & Kretzer of Farmer's Flat have not as much water as they want, yet they are washing off considerable amount of ground and will no doubt make a good report if the season yet affords a reasonable amount of rain.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brinon's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. Baby Hoists for Prospecting, 4 H. P. to 6 H. P.

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail. HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,760 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

WINDMILL.—Chas. W. White, Santa Rosa, Cal. No. 294,943. Dated March 11, 1884. This improvement in windmills consists in vertically-pivoted or swinging concave-convex vanes, the means for holding them open at an angle to receive the wind and the means for adjusting them. Certain weights holding the vanes at an angle with the true circumference afford openings between each for the action of the wind. Its force is directed against the inner face of the vanes, which are drawn on sufficiently to expose more surface beyond the pivot cone than on the nearer side. The tendency of the wind is therefore to force said vanes closed, and thus automatic regulation is effected. Other adjustments are also provided.

NECKTIE FASTENER.—O. M. Graves, Dayton, W. T., assignor of one-half to H. D. Graves, Portland, Or. The difficulty of preventing neckties from rising over a standing collar is well known, and many devices have been used to prevent it, the most common being an ordinary pin. But this is difficult to adjust on account of the stiffness of the collar. This invention is a fastener for neckties which is designed to overcome the obstacle. It consists in a piece of wire bent at the center to form a spring-loop, and having oppositely extending arms terminating in a hook bent inwardly. When the tie is set up in its proper bow, its ends or folds cover and conceal the fastener.

FIRE ESCAPE.—Elam Dye, S. F. No. 294,860. Dated March 11, 1884. This fire escape consists in a peculiar extensible frame, in the means for operating it, and in certain details of construction. The object is to provide a means for the escape of persons from the windows of a burning building, and for such similar purposes. Sections slide within each other, and there is a cage suspended within the frame sections and adapted to be raised and lowered by a rope and suitable gearing.

HOSE PATCH.—Geo. W. Towle, Jr., San Rafael. No. 294,934. Dated March 11, 1884. This is intended for mending a leak in hose. It consists in a circumscribing band provided with ribs on its inner sides, and means for adjusting and securing it. The longitudinal ribs are quite useful, as they serve to guard the weakest point on the band, namely, the edges between the tongues. The cross or circular ribs merely supplement the tongues.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTLETT—Sacramento county.
A. S. DENNIS—San Mateo county.
A. C. KNOX—Yolo and Napa counties.
Wm. R. McQUIDDY—Tulare county.
T. H. MERRY—San Bernardino, Ventura and Santa Barbara counties.
C. D. McDUFFIE—Sacramento county.
JOHN H. STURCK—Santa Clara county.
B. W. CROWELL—Merced and Stanislaus counties.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing only one cent) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Mining Share Market.

There is little to say of the mining stock market this week. On Thursday morning, the session was dull and transactions few. The shipment from the Bodie mine was by no means up to what was expected after all the talk about the rich ore. Up on the Comstock they are still prospecting away, but have shown up nothing of importance. The miners there ought to be credited with pluck and energy, working away as they do under repeated discouragements. They are still hopeful, however, and, no doubt, if anything is struck deep down, the old camp will boom again.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Bullion Shipments.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto valled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1807.

This work is unequalled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, \$3, coin, postage free.

An Easy Binder.

A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it.

Price, (size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Publishing Co.'s journals, Harper's Weekly, and Scientific American), 85 cents; postage 10 cents. Postpaid to subscribers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables, and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in subdivisions to suit purchasers, at very low rates and on easy terms. There are 12,000 acres at from \$3 to \$30 per acre, including pasturage, vine, fruit and grain land. Will sell a large tract at a great bargain. Send stamp for map and circular to EDWARD FRISBIE, proprietor (on the Grant), Anderson, Shasta county, Cal.

TRINITY SCHOOL—CHURCH, BOARDING AND Day School for Young Men and Boys, 1531 Mission St., San Francisco. Prepares for College and University. Easter Session opens Thursday, Jan. 4, 1884. Refers to—Wm. F. Babcock, Esq., Col. K. E. Kyre, Joseph Powning, Esq., Gen. L. H. Allen, Wm. T. Coleman, Esq., Geo. W. Gibbs, Esq. For information, address, REV. E. B. SPALDING, Rector.

THE HARMON SEMINARY, Berkeley, Cal.

A BOARDING AND DAY SCHOOL FOR YOUNG LADIES.

This institution will be continued with the spirit and methods of its founders by those who have grown up with them in their educational work. The corps of instructors is full and of recognized excellence in all departments. Address, THE MRS. E. B. HARMON, Berkeley, Cal., Or E. J. WICKSON, 414 Clay St., S. F.

A Plain Book on Assaying.

"ASSAYING GOLD AND SILVER ORES" By C. H. Aaron—Is a new work published by Dewey & Co., which is intended by its author to be available for the use of miners, prospectors and others who only care to know how to assay gold and silver ores. The author of this work is well known in the mining regions of the Pacific coast as a practical metallurgist of many years experience. His writings for the press and his two previous works ("Testing and Working Silver Ores," and "Leaching Gold and Silver Ores") have shown his ability as a writer. The little book is plainly and simply written, more especially for the use of those persons not familiar with chemistry. No symbols are used, everything being plainly stated and clearly described. The scope of the book is shown in its table of contents as follows: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mining and Charging; Assay Liharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. These assaying tables give simple directions for figuring out results. This is the simplest, cheapest and most easily comprehended work on assaying yet published. The volume comprises 106 pages, with illustrations, and is well bound in cloth. The price is \$1, postpaid. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS office, San Francisco—1884.

TO THE LADIES.

MRS. ADCOCK, having just returned from the East, begs to offer to the public some of the FINEST GOODS ever imported to this coast at prices lower than ever before. Inspection is solicited.

Iron and Machine Works.

MACBETH'S -PATENT- STEEL PULLEY.

Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley. They are the only pulley of the kind which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited),
LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.,—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,

For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

TESTIMONIALS.

ST. LOUIS, MO., Sept. 28, 1883

Messrs. Adolphus Meier & Co. GENTLEMEN: We cheerfully certify that the "Heine Patent Safety Boiler" put up by you in our establishment has proved very satisfactory in its work. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASSN.

OFFICE OF SUPT. OF ROYAL RAILWAYS,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Platz Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished

with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed) BRAUCKE.

NO. 7 IMPROVED AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

WORTHINGTON MINE PUMP.

ALEXANDER L. HOLLEY, being duly sworn, says: I am by profession a civil and mechanical engineer. I have been especially employed during the last ten years constructing and managing works for the manufacture of Bessemer steel. I am now Consulting Engineer to the Bessemer Steel Works of Troy, the Cambria Iron Works, the Bethlehem Iron Works, the North Chicago Rolling Mills, the Joliet Iron and Steel Works, and the Edgar Thomas Steel Works. In all Bessemer Works the hydraulic machinery is the most EXPENSIVE and the HARDEST WORKED part of the plant. Any delay or serious fluctuation in its operation is fatal to the commercial success of the Bessemer process. After extensive acquaintance with the WORTHINGTON ENGINES, and with all such other forms of pumping engines as have been applied to the purposes required, I have adopted it exclusively, and to my knowledge it is adopted in every Bessemer works running or building in America. I have also, for the same reasons, adopted the WORTHINGTON PUMPS for feeding boilers.

Will CONTRACT TO RAISE ANY REQUIRED HEIGHT SINGLE LIFT with our NEW PATENT MINE PUMP. Recent practical tests in Deep Mines of Mexico demonstrate this to be the BEST MINING PUMP extant. The largest stock of PUMPS for all purposes west of New York at our

Dakota Mines.

The Black Hills Mining Regions.

The gold and silver mines of Dakota are situated in the western part of the Territory, between the North and South Forks of the Cheyenne river, and are embraced in a region extending southward from the 45th parallel, about 100 miles in length, and 50 miles in width, as shown in the accompanying map. The Black Hills, in which these mines are found, are mountainous elevations "rising from the plains like islands in the sea," lying partly in Wyoming and partly in Dakota, between the 103d and 105th meridians of north latitude and the 102d and 105th meridians of west longitude. The hills are covered with forests of pine and intersected by rapid rivulets and deep ravines, and occasionally inclose grassy valleys and parks covered with luxuriant vegetation. The outcropping formation below the foothills is slate; above that, in successive order, are beds of limestone, magnesian rock, granite and slate.

In the northern part gold is found in ledges as well as in placers. The veins as a usual thing are of considerable width and filled with low grade ores cheaply mined and easily worked. Some of the ledges are reported to extend 70 miles in length. The trend of the auriferous and argentiferous veins is from north to south. Rapid creek and its tributary, Castle creek, rise in the limestone formation west of the hills, flowing eastward; have cut their way through the mineral veins which contain the original deposits of the precious metals, and have produced rich placer mines in the valleys below, into which the slower currents have dropped the precious metals the waters carried down.

The principal streams that rise in the hills are the Elk, Rapid, Spring, Battle, French, and Beaver creeks, which empty into the south fork of the Cheyenne; and the Bear, Butte, White-wood, Spear Fish and Redwood creeks, principal tributaries of the north fork.

The principal placer mines are located on French, Battle and Spring creeks and their tributaries, but the working of these mines have been retarded by the lack of water.

A ditch to carry water from Cold springs to Nigger hill, a distance of forty miles, is constructed for the purpose of working the ground. The richest placer mines which have been worked are located in the Deadwood, White-wood, Gold Run and Bohtail gulches, which appear to have been worked as far as they can successfully be by the usual methods of sluicing. Great difficulty has been experienced for want of sufficient water. The Bear Butte creek runs through a region rich in silver mines, from which the production thus far has been about \$150,000. The ores, although of high grade, are found in disconnected localities, and no well-defined veins have as yet been developed. Seven or eight miles above Deadwood, bars and banks of auriferous gravel, rich in gold, are found in the bed or on either side of White-wood creek, as it debouches from the hills. Around Central City and Lead City are quartz ledges. From the mines of the Homestake Company, ore has been extracted for hundreds of feet across the formation, and their limit has never been reached.

There are many locations in the hills, equal in extent and as valuable as the Homestake, still undeveloped, only awaiting capital for their development.

The secret of the success of the belt mines of

the Homestake group is in the magnitude of their ore beds and in the inexpensive method of mining and milling their ores, which costs less than \$1 50, and lately only 80 cents per ton. These mines have declared regular dividends on low grade ores averaging only from \$4 to \$5 per ton.

A 100-stamp mill will crush 3 tons to the stamp every 24 hours, and as the ore is easily and cheaply mined, a profit upon the invest-

ment's mills, the last named having been supplied with ore from the Minerva mine.

Hydraulic mining in the Black Hills was carried on in a more systematic manner during the year, and more successfully, than at any previous period. The season was favorable on account of the early and long-continued rains, which furnished abundance of water for hydraulic mining; flumes and ditches were constructed, costing thousands of dollars, and so

THE BLACK HILLS MINING REGION, DAKOTA TERRITORY.

ments in these mines is surer than that in veins of ore assaying into the thousands. Gold is found in nearly every gulch and bill within the mineral belt, and gold mining is carried on from Custer City on the south to Bear Gulch on the north, a distance of 90 miles, and from Rockerville on the east to Rockford on the west.

Homestake, Deadwood-Terra and Father De Smet are the principal large mines. Besides these, many private corporations and persons whose earnings and profits are not reported are taking out large amounts of bullion, and appear to be profitably employed.

The ore from the mines in the Black Tail Gulch has kept 145 stamps running; 60 in the Esmeralda, 20 at Cassel's and 20 at Dorrington's.

far as known the enterprises were judiciously located, and promise the projectors large and speedy returns for their investments of capital and labor.

In the vicinity of Rockerville are mostly placer deposits of auriferous cement, and from the bars and gulches in the neighborhood half a million dollars' worth of gold has already been taken. At Sheridan, on Spring Creek, the fissure vein is reported to be over 100 feet in width, of solid but refractory ore, containing copper, gold, lead and silver.

EAGLE CITY is 2,300 feet above the sea level. The width of Pritchard gulch is 400 to 500 feet, the fall is about two inches to the rod.

Hoisting Ropes.

The use of wire for hoisting ropes in mines is now almost universal. These ropes require great care and attention, however, and their durability depends in a great degree upon the care taken of them, aside from the actual work they have to do. Being in damp and heated places, the surface of the wires must be protected by suitable material such as tar, grease or special compounds. The winding on the reel and the varying strains has an effect in deteriorating also.

The question of actual strength of rope in relation to the working load and velocity is being investigated in Europe by careful persons. It is not probable that the factors of safety adopted by rope makers can be materially altered, still it would be interesting to determine separate factors for dead weight and velocity, and also for various sizes of ropes. As it is there is some margin, the working load being given by English manufacturers at from 1.8 to 1.10 of breaking strain, the difference being, presumably, for varying velocities. In France, the Commission appointed to report on breakages of colliery ropes stated that the best firms only loaded their ropes to one-tenth of breaking strain; but in small ropes of good wire, where each wire had its own share of work, this was occasionally increased to one-sixth. In Belgium the factor of safety is one-seventh; in Germany, one-eighth to one-ninth. The deterioration of ropes by wear is also an important question. The Commission just referred to state that new and old ropes vary in the proportion of 100 to 55 (or 45) and that the difference in strength of individual wires, while not averaging more than 13 per cent in a new rope, approach 75 per cent in a worn rope. The same authorities state that in flat ropes the results are still more marked, as the wires will not, after use, stand one bend in the vice, which is partly attributed to the cutting action of the stitching wires. Now this question, which means the alteration in nature of steel or iron wire, is a very important one, as it must regulate the life of a rope, although apparently uninjured.

PROPORTIONS OF THE STEAM ENGINE.—A little work on "The Relative Proportions of the Steam Engine" has been issued by Wm. D. Marks Whitney, Professor of Dynamical Engineering in the University of Pennsylvania. It is a rational and practical discussion of the dimensions of every detail of the steam engine. The work is illustrated. It is really a series of lectures, and gives in a practical form rules and formula for the determination of the relative proportions of the component parts of the steam engine. This is a revised edition and contains a few added lectures, one of which is "The Cheapest Point of Cut-off." The book comprises over 200 pages, and is really a valuable one for reference. To engine designers and builders it contains much data of the greatest utility. Joseph A. Hofmann, 208 Montgomery street, is the special agent here for the sale of the book.

THE miners down about Silver City are now able to get the ore they have been taking out during the winter reduced without difficulty, as all the mills have an abundance of water.

HEAVILY laden pack trains are arriving almost daily at Eagle.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Mount Cory Mine.

[From our traveling correspondent.]

EDITORS PRESS:—This newly developed bonanza mine is in Esmeralda county, Nevada, 12 miles west of Hawthorne, the county seat of Esmeralda county. Two years since some prospecting miners seemed to think they had indications of a good mine, and by persistent labors they succeeded in exposing some ledge and also inducing some visitors to climb along their trail six or seven miles from the valley to see their prospects—each would say an encouraging word, and wind his way back to the depot, hoping to find some mine nearer the open plain.

Among the excursionists over this pleasant route of the C. & C. R. R. were A. G. McKenzie, one of the old Comstock mining experts, and superintendent of the Sierra Nevada, Utah and other mines; a thoroughly practical and experienced miner, a cool, calculating judge of values in mines. With him, Judge G. R. Wells and J. L. Flood, son of J. C. Flood, of bonanza note—who, though a very young man, is considered one of our most careful and cool business men. I saw him first at Hawthorne, and the comments there of business men were certainly of the highest commendation. One remarked that "he has sowed his wild oats, and doesn't put on as many airs as many men do who haven't \$10 to their name." Among the visitors to the Mount Cory prospect hole, were these three gentlemen, who were well pleased with the indications, and bought them for the sum of \$15,000. They then went on and bought hill lands, some 4,000 acres, to secure rights and privileges in connection with, and for the development of, the mine, and for mill site.

For one tract of 160 acres about 4 miles from Hawthorne where they now have their reduction works and machine shops, they paid an old gentleman, who had erected a small brush shanty as sign of possession, \$5,000 for his possessory title and good will. Thus by freely dispensing their cash thousands they secured

Ample Rights and Privileges

For all their contemplated improvements, should the mine, when further developed, prove satisfactory. This development test work was left under the management of superintendent McKenzie, who has spent near two years with a force of excellent miners exploring the ledge thoroughly before making any move toward building reduction works.

This development consists briefly in running various tunnels and drifts, some of which I will enumerate, as they are designated at the mine:

Tunnel A exposes 100 ft. length of ore body.
Tunnel B exposes 130 ft. length of ore body.
Tunnel C exposes 230 ft. length of ore body.
Tunnel D exposes 330 ft. length of ore body.

Tunnel E, the lowest, is now in about 1,200 ft., giving 600 ft. depth of ledge or backs, and has already exposed three well-defined chimneys of ore. The first chimney at 600 ft., second 800 ft. and third at 1050 ft. from mouth of tunnel.

These Chimneys

Occur in a large porphyry dike ranging from 160 ft. to 260 ft. in width. This porphyry dike is in granite formation, and is one of the most perfect and well defined that is to be found in this or any other part of the country, and no doubt from all the surface and underground indications this mineralized dike of porphyry (carrying separate ore bodies) continues for several miles in the direction of S. W. and N. E., which is the direction of the vein.

The Ore Bodies

On those levels described above, in many places show double or parallel veins, ranging from 18 inches to 12 feet in thickness of ore, which, as far as developed, shows a value of about \$60 per ton. The mine has an elevation of 8,000 feet above sea level, and about the same as top of Mount Davidson, thus giving grand opportunity for deep workings, and as if to utilize this idea the superintendent is now sinking a shaft from the bottom of tunnel E at the distance of 1,000 feet from the mouth. This shaft is double compartment, solid work for deep workings. It is sunk about 50 feet south and east of ledge, now down near 100 feet, where they will drift and cut the vein, and the same at each 100 feet of depth. It is now running in some soft porphyry formation as above. They propose when they reach the depth of 100 feet in this shaft to put up good power machinery in the chamber excavated within the tunnel, for this shaft. When this machinery is placed in order the sinking will be pushed rapidly, and rich developments are expected soon. These various prospecting works in the different levels had placed on dumps ready for the reduction 20,000 tons of ore before the mill was built. When they were satisfied that they had a mine, they lost no time until they had secured the lands contiguous and lying along the route of their roadway out to the valley, together with all springs or water rights of Big Squaw creek and all its tributaries for a distance of about 14 miles. By these cash methods this company prepared the way to thoroughly possess themselves of a piece of undeveloped mining property, and all the necessary rights of surrounding lands and water that might be required for the successful working of their mine. In the furtherance of this programme, they have graded a road from the

valley to the mine of about 8 miles, at an outlay of \$18,000, giving them a good, even, down grade from the mine to the mill. While the developing of the mine was going on, the great problem of what

Treatment this Ore will Require

Was being solved with much care. About 20 tons of the Mt. Cory ore were taken to the Geddes and Bertrand leaching mill at Secret Canyon, 8 miles from Eureka, Nevada, which is in charge of Mr. Clark, a very efficient and successful manager of this process. The results of all their experiments and expert counsel made the decision to erect similar works to those of Secret Canyon, but in every possible way to improve on those.

At a cost of \$230,000 they have now completed the mill sufficiently to start up, and make some very satisfactory work, so that it is pronounced now a perfect success, and only requires a short time to adjust the movements of one part to the capacity of other portions, and also with reference to the varying richness of the ore being treated. The Chrome Steel rollers are found to be capable of crushing a larger amount of certain ores than can be successfully treated by some of the other machines, but this and various differences will be readily discovered and adjusted by Mr. Albert Arents, who is in charge of the whole process and is considered a thorough proficient in all departments of the metallurgy of the precious metals.

They are moving off carefully, not running up to the full capacity. Last week sent down \$21,000. result of 10 days' run. Now working about 40 men in and about the mill, which is now working only about 50 tons daily, but when they get all adjusted they expect to easily handle 60 to 70 tons daily.

The ore will assay about \$60 on average. Now employing about 60 men in the mine.

While building the mill they had a pay-roll of 165 men at one call.

This now completed mill, built by Sankell and Eckert, is considered a grand testimony of their skill and ability to plan a grand success. This little Trio Bonanza firm, incorporated as "The Nevada Mining and Commercial Co.," have very modestly expended about \$500,000 in cash, preparatory to taking out dividends, from one of Hawthorne's mines. In my last letter I spoke of several of the districts that completely surround Hawthorne, and each have good openings for bonanza enterprising men to invest.

It was my intention to give a short description of this mill, but my letter is already too long, and as we have the promise of one of this bonanza firm that we shall have a

Full Detailed Account of Mill, Process

And treatment throughout as soon as it is fully regulated, I will defer that for the present, and wish this company the best success, and advise Hawthorne not to get alarmed even if she gets surrounded by these monopolizing, cash-paying capitalists, who open roads, open mines and ship big hullion. Let your narrow-gauge railroad monopoly run right along—it may help to bring gouty capitalists, who otherwise would never know anything about your thousands of rich mines now held by the original "we, the undersigned locators." We will watch your local papers carefully, to note Mt. Cory's successes and your general development progress.

This Mount Cory property is entirely a private enterprise of the three incorporators, and not on any stock board, nor is there any stock for sale. They therefore are not seeking in any way to put their business matters before the public, but so much is obtained by request.

B. W. CROWELL.

[Since the above letter was written, Mr. McKenzie, the superintendent, has passed away, dying very suddenly, and Mr. Arents has been chosen superintendent.—EDS. PRESS.]

WYOMING'S WEALTH.—A correspondent of the *Tribune* from Rattle Snake Mining district, Carbon Co., Wyoming, March 10th, says: "Perhaps you would like to know something about this country. The place is eighty miles north of Rawlins and the road from here to Sand creek is about forty miles, twenty of which is like Little Cottonwood in winter, but there are no snow-slides. We are accustomed to snow and so we don't mind it. The next place we strike is Sweetwater, where the soda lakes are. Here is where Brigham Young used to get the stuff he used in making bread. The soda is one inch thick on top, and underneath it is from one foot to twenty feet deep, all solid soda. The next place we strike thirty miles away is the Oil Camp. In looking around I met an old-time miner from California, and well known in Salt Lake City and the mines around. It was Cap. S. I. Iba. He has the best oil springs and the best oil ever found. He feels happy. Before six months roll around there won't be a foot of land left in this basin for a man to take up. It is about seventy-five miles long and ten miles wide. A Cheyenne, a Rawlins, a New York and two Denver companies have property here. There will be two railroads in here before long. The wealth and the attractions are so great that railroads are bound to come. There is a great deal of farming land on the Platte river and the creeks running into the Platte. There is also a big cattle trade here. The C. P. goes through the heart of the stock country, the silver and gold mining region, the vast soda beds and the everlasting oil wells. There are but few miners here. I think this will beat digging in the snow for gold."

Globe District.

The Experience of a Mining Camp.

We have watched with interest, says the *Globe* (Arizona) *Chronicle*, the present condition of the Globe mineral district; have weighed its present condition and future prospects, and after a careful and impartial investigation have come to the conclusion that there is nothing to discourage our people on account of the present stagnation of business. From some cause, which our wisest statesmen and most learned economists have been unable to satisfactorily explain, there has been for the last year a general stagnation of business throughout the whole country—east, west, north and south the general cry has come that business is languishing, and the daily reports of failures throughout the United States have never been more discouraging. Whilst money has been plenty and cheap in the monied centers of our country, yet the general complaint has been made as to the dullness of trade and want of activity in business circles. Why this is no intelligent cause has been assigned, as the resources of our country have never been more abundant, and, with the single exception of the iron interests, all appear to be flourishing and in a prosperous condition. Our farmers were never more prosperous in the agricultural States, and our grazing and feeding industries were never more flourishing, as the price of beef, pork and all kinds of grain fully testify.

Why business is dull in Arizona may perhaps be explained by the fact that Eastern capitalists have become somewhat cautious in regard to mining investments, and for the present are withholding their means to develop our resources. The country has been overrun by a class of adventurers who have induced capitalists to invest their funds in enterprises that simply meant "bread and butter" for a few superintendents and their particular friends, while the honest workman and the credulous capitalist have been the victims of these sharpers; and by this means the country has been brought into disrepute, and all must suffer.

Take the Globe district as a sample of the mining industries in this Territory. Almost millions of money has been invested in the district. Expensive mills and mining operations commenced, and all of a sudden operations have ceased, and the mills and mines are standing idle, living monuments of either mismanagement or wild speculation on the part of adventurers, and not for the want of paying mineral in ample quantities.

The wild spirit of speculation has been the great drawback of this territory. Men come here expecting, in a few short months, to "strike it rich," and then return to their native homes and enjoy, at their leisure, the wealth they expected to realize in a few months. The hills were covered with prospectors, and unless rich leads were found that paid hundreds to the ton from "the grass roots" down, they were hastily abandoned and new ventures made; and the result is that thousands of prospects were made—now abandoned—which, if they were worked on business principles, would pay good daily wages to the miner, and lead to a legitimate industry that would cause this town to flourish far beyond any other town in a purely agricultural region. The wealth is here—almost unbounded—and the time will come, if not in the immediate future, at no distant day, when the honest toiler can realize more for his labor than in any other locality, for he honestly believes that the Globe Mineral district is the richest body of mineral lands on the continent. Whilst, as yet no great bonanza has been developed, yet no other district shows such a general diversity of mineral wealth, for we have gold, silver and copper in almost every range and valley in the district, and from this source alone the great vitality of Globe, in defiance of a general stagnation of business, holds fast to her position and promises to weather the storm and come out victorious in the end. Let her people stand fast, exert all their powers in a legitimate and honest industry, and all will be well.

The greatest obstacle we have had to encounter has been the wild and crazy speculation of adventurers. Promising mines have been discovered—prospects merely have been sold for thousands of dollars to Eastern capitalists on false representations. Money has been invested in building mills and purchasing costly machinery before even a ton of paying ore was placed on the dumps. Companies were bankrupt before they commenced operating their mills, and superintendents and supernumeraries swallowed up the spare funds in extravagances and wild schemes, and before even a proper test could be made the stockholders were exhausted and the mills now stand idle. We can point to more than one instance in our immediate vicinity of this character.

The town of Globe is now going through the ordeal of a past record of reckless speculation and an honest and legitimate business. The wild fancies of the theorist and speculator must give way to the legitimate and frugal industries. The mineral is here, and in ample quantity to build up a thriving and prosperous community, and ere long men of brains and capacity will take hold, and the sound of the hammer and the puff of the engine will be heard in our midst; and the men of nerve and backbone who stand the test and hold on will be rewarded for their bravery. Let every man in Globe and vicinity be determined to "hold the fort" and we feel satisfied all will be well.

The Sierra Buttes Mine.

As this is the best paying mine, not only in Sierra county, but also one of the best in California, it is entitled to more than passing notice from time to time. The past history of this great mine, from 1851 down to the present time, since which date there has been no cessation in the taking out and crushing of ore, is a matter well known to all our readers and to the whole mining world. The object of this article is to give a description of the mine as it stands at present, to note minutely the work that has been going on there for the last couple of years. There are eight tunnels run through solid rock, from which the ledges have been worked. Tunnel No. 1 runs entirely through the hill; tunnels No. 1 to 5 are from 700 to 2,500 feet in length; No. 6, 4,500 feet; No. 8, over 3,000 feet. The ledge is now being worked 1,000 feet below the upper tunnel. No. 9 tunnel is on a level with Sierra City, and was started three years ago. The diamond drill is used in boring, being impelled by compressed air forced through pipes into the tunnel. This tunnel is now in 3,700 feet. Eventually it will be run 9,000 feet. At 6,000 feet it is expected to strike the pay ledge, 700 feet below the present workings. Last July's work was begun on a forty-stamp mill at No. 9 tunnel, and this week twenty stamps commenced crushing on ore from No. 8 tunnel. The ore is transported from that point to the mill on a double-track tramway 1,400 feet in length. The other twenty stamps will not be ready for operation before June. George Woodward, an experienced mill builder, has had charge of this work. Under his skillful and practical eye a piece of work has been done that is not only a credit to himself, but also a matter of pride with Sierra county. Ours is a mining county, and it is something to boast of that we have one of the finest quartz mills in the State. Sierra City in particular has reason to put on a little extra airs. The dimensions of the new mill are 98x85 feet, and 81 feet high. The machinery is propelled by a six-foot Pelton wheel, with 550 foot pressure of water. The mill is supplied with eight Frue concentrators, Hendy's self-feeders and a Blake rock-breaker. Outside of this nearly the entire machinery has been furnished by Forbes & Taylor, of the Downieville Foundry. Wherever it was practicable to use steel around the batteries it has taken the place of softer metal. The tappets, bosses and cans are made of steel. In two or three years the entire works of the mine will be moved down to the lower levels, and Sierra City will be much benefited thereby. The Sierra Buttes mine alone will insure prosperity to our town for many years to come.—*Sierra Tribune*.

Horse-Power Mining Hoist.

The following lines regarding the operation of the "Baker Mining Horse-Power Hoist," will be of interest to parties engaging in opening new mines. It is a machine that is destined to play a very important part in the early stages of mine development in all parts of the country.

STODDARD, Yavapai Co., A. T.

October 10, 1883.

Messrs. Rankin, Brayton & Co.—GENTLEMEN:—The "Baker Mining Hoist" which we purchased of you some months ago, does all you claim for it in a most satisfactory manner. In sinking shaft we are hoisting from 25 to 30 tons of rock per day of 24 hours, from a depth of about 200 feet, and when we commence drifting, shall double the amount. The machine is strongly geared and works more easily and rapidly than any we have ever seen. It has also the advantage of great permanence and durability as well as having safety appliances that afford perfect security from accident. Our foreman who has had sixteen years of mining experience, says it is without exception, the best Horse-Power Hoist in use.

Wishing you the success the machine merits, I am respectfully yours,

BENTON H. WILSON,

Superintendent.

THE printing world of London is much disturbed by the discovery of a new process which enables any number of copies to be taken of any book, even the oldest, without setting a line of type. A compound has been discovered which may be spread upon a page without in the slightest way injuring the paper, and which refuses to rest upon ink. It can be easily removed to a stone, and there becomes the matrix for stereotype, or can be used for printing from at once. Practical printers are experimenting to see whether they cannot save the cost of re-setting old editions, and, if certain practical difficulties are removed, there will be a change not only in the production of *fac-similes* of old books, but in the reproduction of new ones. It will be no longer necessary to keep type standing, as a proof will be as good as a stereotype plate.—*Exchange*.

THE BONANZA MINES.—In answer to a question by a correspondent, the *Virginia Chronicle* gives the following information: The average of the Bonanza mines during the period of their greatest prosperity was \$3,000,000 per month in bullion. Of this amount 40 per cent or \$1,200,000 was gold. Assuming that an avoirdupois pound of gold is worth \$300, the weight of that amount would be 4,000 pounds or two tons. The greatest amount extracted in any month was \$4,000,000 in bullion, the gold of which would weigh nearly two tons and a half.

MECHANICAL PROGRESS.

A Bisulphide of Carbon Motor.

We have already made allusion to an invention in Chicago of a new device for employing the vapor of carbon bisulphide as a substitute for the vapor of water for motor purposes. The new engine is called "A Triple Thermic Motor," and a late number of the *Chicago Tribune* gives a detailed description of it, and expresses the opinion that it is destined to work a revolution in motive power.

According to the *Tribune*, the engine consists of four principal parts: A generator, boiler, engine and condenser.

The generator is a common 10-horse power locomotive portable boiler, filled with water in the usual manner.

The boiler is a plain tubular boiler, surrounded by an iron shell or casing, (instead of being walled up in the usual manner) dispensing with grate bars, fire front castings, breeching, and large smoke stack, having at each end a heat receiving and distributing chamber. These chambers are formed by the walls of the casing projecting six inches beyond the heads of the boiler, and are connected with the generator by means of a pipe, and with each other by the tubes of the boiler (running from one end to the other). The boiler is filled with carbon bisulphide to the usual water line.

The engine is of ordinary construction, having its cylinder and steam chest jacketed and so arranged that the aqueous vapor in the jacket and the bisulphide of carbon steam in the cylinder do not come in contact with each other.

The cylinder of the engine and the boiler are connected by a steam pipe, which is inclosed in a pipe which connects the casing of the boiler and the jacket of the cylinder.

The condenser is the same as that of an ordinary steam engine, with the exception that it does not have one-fourth of the condensing surface.

Heat being applied to the generator and steam generated from the water passed over to the heat receiving and distributing chambers, the carbon bisulphide in the boiler will become heated to a temperature corresponding with that of the generator by the steam passing under the boiler and returning through the tubes to the chambers.

If the water in the generator is heated to 230 degrees, the gauge will show six pounds to the square inch of a working pressure. The gauge on the heat receiving chamber will show a corresponding pressure, while the gauge on the boiler will show sixty-eight pounds of a working pressure.

Now, suppose this is the number of pounds desired by the engineer, just as soon as it is obtained an automatic valve attached to the pipe connecting the heat receiving chamber and generator will be operated by the pressure itself, and no more heat can pass to the boiler until the pressure falls below sixty-eight pounds; falling below this the heat will again pass in. This valve, acting automatically, perfectly regulates the heat, and therefore controls the vapor's expansive force, that bursting the boiler is a physical impossibility. The engineer opens a valve and permits the aqueous vapor to pass into the jacket that surrounds the cylinder and the steam chest, heating them to the temperature of the boiler. The throttle-valve is now open, and the vapor of carbon bisulphide turned into the cylinder at a temperature as high as when it left the boiler. After performing its office there it is exhausted into the exhaust chamber of the condenser, and by contact with the metallic surface is condensed and collected in the well at the bottom, and by the use of a pump returned to the boiler to be again evaporated, and so on indefinitely. The exhausted carbon bisulphide vapor by a simple contrivance is used to heat liquid carbon bisulphide between the pump and the boiler to a degree much above its boiling point, which is of great advantage, as it assists condensation in the condenser and evaporation in the boiler.

How the Carbon Vapor is Produced.

The mode of heating by aqueous vapor is as follows: As soon as the steam in any of the pipes, tubes or chambers is condensed it will then have surrendered all of its sensible heat in excess of 212°, and it will also have surrendered 966° of latent heat, or a total of say 1,000 thermal units to the carbon bisulphide. This 1,000 is now sensible heat, and will accomplish the same purpose as though received directly from the furnace. Having changed its state from a vapor to a liquid, it is permitted to leave the chambers through a steam trap, and by the use of the pump returned to the generator at a temperature very little below its boiling point. In the generator it will receive 1,000 thermal units, carry it over to the chambers, surrender it all up, and return for another load.

The water in the generator need not be supplied more than once a month; the carbon bisulphide but once during the lifetime of the machinery.

Oil of no kind can be used to lubricate any part of the machinery that is exposed to the action of the vapor of carbon bisulphide. After repeated tests with graphite (or plum bago), it was adopted, being comparatively inexpensive, and as a lubricant giving the highest satisfaction. It is conveyed to the parts

requiring it by the aid of a cup specially adapted for the purpose.

The reader will doubtless ask why are the boiler, pipes and cylinder incased and surrounded with aqueous vapor? It is on account of the small amount of latent heat and the low specific heat of carbon bisulphide. If not thus protected by aqueous vapor it would lose 50 per cent of its expansive force before reaching the cylinder. Aqueous vapor is selected, as of all substances it is of the very best to prevent the escape of heat by radiation or conduction.

One Cause of Previous Failures.

Many attempts have been made to heat carbon bisulphide by bringing it in direct contact with the water, but the impurities of the water and the action of water on metallic surfaces produce compounds that destroy the carbon bisulphide, and the vapor or steam passing to the condenser renders condensation more difficult. The carbon bisulphide liquid and vapor must be separate from all other liquids or vapors.

How is it possible to effect so great a saving in fuel when aqueous vapor is used for heating and carbon bisulphide for propelling the engines? We can only answer that it is done by employing that agent to do the kind of work it is by its nature best adapted to perform—steam, pound for pound, can carry more heat than any other substance; it is, therefore, employed to carry heat. It will not only carry but will honestly deliver up all it carries at the right time and place. Carbon bisulphide has greater expansive force for the same number of thermal units than any other staple compound; it is, therefore, employed to propel machinery. The better to understand

How This Great Saving is Effected

By the use of the process and machinery just described, a knowledge of the cost of the production of steam and the use that is made of it is necessary. For example, to obtain a working pressure of sixty pounds, even when the water is pumped into the boiler at its boiling point, requires an expenditure of 1,000 thermal units. Now, the engineer can by no possibility in any steam engine use more than 100 of these, and throws the 900 away by the exhaust. That is, the steam when it is exhausted has only parted with its actual heat in excess of 212°, and carries off as waste all its latent heat. This is true of every steam engine now in use. Whereas, if steam is used to heat the carbon bisulphide not one unit of heat is thrown away.

On the other hand, of the 216 units that it requires to produce a like pressure with carbon bisulphide, the exhaust only carries off 156 thermal units. Therefore there is a saving of 966 less 157, or 810 thermal units on every pound of water evaporated. That is a saving of 81 per cent in favor of carbon bisulphide. This is

What is Claimed for "The Triple Thermic Motor"

In comparison with the steam engine:

1. It requires no greater skill to operate.
2. It insures a more uniform power.
3. It is adapted for all purposes for which the steam engine is now used, and for many purposes for which it is entirely inapplicable, especially for mines.
4. Less liable to explosion.
5. There is no corrosion in the boiler.
6. The boiler can not be burned.
7. No new machinery required, or extra skill by those prepared to build common engines.
8. No noise, no dust, no grease, no sparks.
9. It will do the same work with less than one-fourth of the fuel.

A NEW STEEL is being produced by a company in Sheffield, Eng., which, if reports are true, will be of great value to the railway as well as the manufacturing world. The product is made by adding from 7 to 20 per cent of "the ordinary ferro-manganese of commerce to iron either wholly or to a good extent decarbonized and refined, and treated by any of the ordinary processes, or to steel produced by such processes." A small test bar containing 12 per cent of manganese was bent double when cold, and was sufficiently hard to turn iron. An axe, containing the same percentage and which had neither been hardened nor tempered, being just as it came from the mould, cut in two a bar of iron half an inch square. The correspondent of the *American Manufacturer*, who gives these facts, says that the steel is capable of being hammered or rolled the same as ordinary wrought steel, and that the specimens showed no magnetic qualities. He adds: "An impetus to the steel-rail trade has certainly been given by this invention; for chilled rolls should now be pushed from their stool."

TO PREVENT BOILER EXPLOSIONS.—An ingenious device to prevent boiler explosions has recently been patented. It consists of an electric battery placed on the wall near the boiler, connected with a gong by negative and positive wires. These wires run to the water gauge and connect with a glass bulb filled with mercury. When the water falls below the point of attachment, the steam rushes into the space surrounding the mercury bulb, and the mercury expands. As it rises in the tube it comes in contact with a platinum wire, thus closing the electric circuit and ringing the alarm bell. When water is pumped into the boiler it forces the steam back, breaks the circuit, and puts the alarm in working order again. This invention recommends itself on account of its simplicity.

SCIENTIFIC PROGRESS.

The Heat-Sense of Science.

The sense of sight is not the only sense affected as an iceberg is approached. There is a sensible lowering of temperature. But to the natural heat-sense this cooling is not so obvious or so readily and quickly appreciated that it could be trusted instead of the outlook of the watch. The heat-sense of science, however, is so much keener that it could indicate the presence of an iceberg at a distance far beyond that over which the keenest eye could detect an iceberg at night; perhaps even an isolated iceberg could be detected far beyond the range of ordinary eyesight in the daytime. Not only so, but an instrument like the thermopile, or the more delicate heat measures of Edison and Langley, can readily be made to give automatic notice of its sensations (so to speak).

As those who have heard Professor Tyndall's lectures any time during the last twenty years know, the index of a scientific heat measurer moves freely in response either to gain or loss of heat, or, as we should ordinarily say, in response either to heat or cold. An index which thus moves can be made, as by closing or breaking electrical contact, or in other ways to give very effective indication of the neighborhood of danger. It would be easy to devise half a dozen ways in which a heat indicator (which is of necessity a cold indicator), suitably placed in the bows of a ship, could note, as it were, the presence of an iceberg fully a quarter of a mile away, and speaking of it much more loudly and effectively than the watch can proclaim the sight of an iceberg when much nearer at hand. The movement of an index could set a fog-horn lustily announcing the approach of danger; could illuminate the ship, if need be, by setting at work the forces necessary for instantaneous electric lighting; could signal the engineers to stop and reverse the engines, or even stop and reverse the engines automatically. Whether so much would be necessary—whether those among lost Atlantic steamships which have been destroyed, as many have been, by striking upon icebergs, could only have been saved by such rapid automatic measures as these—may or may not be the case, but that the use of the infinitely keen perception which the sense-organs of science possess for heat and cold would be a feasible way of obtaining much earlier and much more effective notice of danger from icebergs than the best watch can give, no one who knows the powers of science in this direction can doubt.—Prof. R. A. Proctor, in *Popular Scientific Monthly*.

Limit of Hearing.

This subject has recently been studied by M. E. Panchon, and his results have been communicated to the French Academy of Sciences. The notes were produced by a powerful siren of the kind invented by Cagniard-Latour, and actuated by steam. The highest audible notes produced in this way had 72,000 vibrations per minute. Mr. Panchon has also vibrated metal stems fixed at one end, and rubbed with cloth powdered with colophane. In diminishing the length of the stem the sharpness of the note is increased. Curiously enough, he finds that the length of stem giving the limiting sound is independent of its diameter; and for steel, copper and silver the lengths are in ratio to the respective velocities of sound in these metals—that is to say, 1,000 for copper, 1,002 for steel, and 0.995 for silver. Colophane appears to be the best rubbing substance. When the acute sound ceases to be heard the sensitive flame of a gas jet is still affected by it.

While upon this subject we may mention that Mr. Francis Galton has recently invented a "hydrogen whistle," which enables him to obtain notes far above the upper limit of human hearing, its object being to test the hearing powers of insects, which, as is now known, have very acute ears. The number of vibrations produced by a gas in a whistle is universally proportional to the density of the gas, and as a hydrogen is thirteen times lighter than air, the sounds produced by it in a given whistle are thirteen times shriller—that is to say, the pitch is thirteen times higher. Mr. Galton has made a whistle 0.14 inch long and 0.04 inch in diameter, which, with hydrogen gas, gives a sound of 312,000 vibrations per second. The whistle is fitted with a piston at its base to regulate its length, and it is probable that still higher notes can be obtained with a shorter length.

Earthquake Phenomena.

In the last issue of the *Popular Science Monthly*, M. Danhee has an instructive paper, with the above title, from which we reproduce the following explanations respecting the probable causes of these occurrences:

The causes of earthquakes have long been the subject of many conjectures. The numerous investigations of later years have contributed much to define their characters, and several data recently acquired tend further to make their mechanism clear. It is known that the shocks are by no means distributed haphazard over the surface of the globe. The countries

where the strata have preserved their original horizontal position, like the north of France, a part of Belgium, and the most of Russia, are privileged with tranquility. Violent commotions are manifested particularly in regions that have suffered considerable mechanical accidents and have acquired their last relief at a recent epoch, like the region of the Alps, Italy and Sicily. The tracts that are simultaneously disturbed by the same shock most frequently comprise areas from 5 to 15°, or from 300 to 1,500 kilometers. They rarely include a much more considerable fraction of the globe, although the celebrated catastrophe at Lisbon on the first of November, 1755, extended over some 17° or 18°, into Africa and the two Americas, or over a surface equal to about four times that of Europe.

The detailed examination of many earthquakes has enabled us to determine the center of the shocks as well as the contours of the disturbed areas. From the manner in which the latter surfaces agree with the lines of pre-existing dislocations, several of the most distinguished geologists, including Mr. Dana, M. Suess and Albert Heim, have considered the shocks in question as connected with the formation of chains of mountains, of which they may be a kind of continuation.

In fact, the crust of the earth everywhere shows the enormous effects exercised by the lateral pressures that have been in operation at all epochs. The strata, bent and bent over again many times through thousands of meters of thickness, as well as the great fractures that traverse them, are the eloquent witnesses of these mechanical actions. Notwithstanding the apparent tranquility now reigning on the surface of the globe, equilibrium does not exist in the earth, and commotions have not been arrested in its depths. The proof of this is found, not only in earthquakes, but also in the slow movements of the soil, of elevation and depression—a kind of warping, which has continued to manifest itself within historical times in all parts of the globe.

The Growth of Specialism.

One of the most obvious results of the rapid expansion of the boundaries of science, as it affects the man of science, is the multiplication of specialists. This result it would perhaps be as logical to designate as one of the evidences of the rapid progress that science is making.

A century ago, or even less, says the *Manufacturer and Builder*, it was not impossible for a single mind exceptionally gifted—like that of Humboldt—to hold within its comprehensive grasp a large portion of the classified knowledge included under the name of natural science. Had he lived in our day, he would never have ventured upon the task of writing a "Cosmos." To-day the man of science, to make his name known and his influence felt, must be a specialist. He must choose between superficiality and thoroughness. If he choose the first, he may pass for a man of learning among the unlearned, but he will be a feather-weight when weighed in the balance of real achievement; if he choose the latter, he must limit his work to a circumscribed area. It will be well for the ambitious student to recognize the fact, early in his career, that he can only hope to master the general principles of the body of the sciences, and that to be of use he must select what may appear to him to be a very subordinate branch of some favorite science, and devote himself to this with zeal, and without fear that he will shortly exhaust it. It may wound his vanity to think that he must content himself to being simply an "ologist" of some kind; but, alas! so vast has been the accumulation of knowledge, and so wide do the boundaries of science extend, that no one mind may compass the whole.

In our day it is "the man of one book" that is to be feared. The specialist wields the baton of leadership.

EVIDENCE OF THE GLACIAL PERIOD IN COAL BEDS.—We find an interesting description of a recently discovered phenomenon, showing the glacial action on a seam of coal, in a letter from Jones, Simpson & Co., published in a late issue of the *Coal Trade Journal*. "The discovery was made by the men at work opening a chamber from the airway, when they encountered a mass of round stones weighing from 1 to 6 or more pounds each, rising like a wall in front of them and extending across the face of the workings, from within about 1 foot from the bottom of the vein and up to the roof; worked around it and found the coal all regular, with this pillar standing in an almost oval shape (the greatest length about 20 feet); started to clean it out and found it ran through the rock to the surface, a distance of over 40 feet. Now it is cleaned out the coal and rock are perfectly smooth, and cut in and out in an almost spiral form, and presenting, as far as we can ascertain, one of the first glacial pot holes discovered in the anthracite coal fields of Pennsylvania. The material taken out was round, smooth stones of different sizes, mixed with gravel and fine sand."

ECONOMICAL TESTS.—The relative efficiency of electricity, gas and oil, for use in lighthouses, is being tested in England, where the Trinity Board has selected certain ranges about three miles inland from the South Foreland lighthouse as lines of observation, along which measurements are to be made. These experiments are expected to last several months.

New Reverberatory Ore Furnace.

A reverberatory ore furnace has just been patented through the MINING AND SCIENTIFIC PRESS Patent Agency by George W. Jones, of Silver Creek, Alpine county, in this State, and assigned to Adams & Carter, of this city, the agents of the well known Frac concentrator. It is a desulphurizing and chloridizing furnace. The special improvements consist in such an arrangement of hearths that the ore may be roasted in a chamber from which the fumes of the chlorine are excluded, but which is so connected with the chamber or chambers wherein the chlorination is effected that charges of ore may be withdrawn from it into said chambers. The arrangement consists of a number of furnaces provided with a track upon the top to facilitate the charging of the whole with ore. There are various doors to the hearths to admit of independent manipulation of the ore. In a three hearth furnace, the hearths are built one over the other in the same shell.

The furnace shells are of brick work. A lower hearth, a central hearth and top hearth is made. These are made by brick diaphragms, and that separating the bottom and central one is very wide. A fire-box or chamber is made for the lower two hearths, and a separate fire-box for the upper one. The escape flue for the center hearth extends upward past the upper hearth, but is entirely separate therefrom, being enclosed, whereby none of the escaping products will find their way into the upper hearth. The escape flue for the upper hearth is at its further end. These escape flues extend upwardly and are enclosed in the arch, from which a common stack opens out. Through the top of the furnaces are made apertures in which are hoppers for feeding the ore. The advantage of this construction may be explained as follows: Ores designed for treatment in this furnace are those containing sulphur. It is necessary to roast the ore to drive off the sulphur, that the chlorine may have better effect; but the inventor has found that such a high degree of heat is required for the process of desulphurizing that when the chlorine is put in it has a tendency to volatilize the precious metals, and thus a great loss is suffered. Mr. Jones states that in his furnace the chlorine, which is introduced only in the lower hearths, and which acts upon the hearths in the lower alone, is excluded from the ore undergoing desulphurization in the upper hearth, in which nothing but the roasting goes on. When that is complete the charge of ore is let down through the traps into the center hearth, and thence into the lower one, being then in a condition free from sulphur. Separate fire-boxes provide for the requisite heat in each hearth, though the hearths may be so arranged as to be heated from a single fire-box. Each furnace is so built with respect to the adjoining ones that the fire-boxes lie close together for convenience in working.

On the top of the furnace, throughout its extent, is a track on which small ore cars are adapted to run. The workmen are protected when running the ear by an arch which carries the escaping gases above them. Doors are provided on opposite sides of the furnaces, and platforms are arranged for the workmen. By the peculiar construction of the upper arch over the tracks a dust-chamber is formed.

GEORGE HEARST and other San Francisco capitalists have representatives at Cœur d'Alene looking for good prospects.

Roasting Iron Sulphurets.

The roasting of iron sulphurets is a simple oxidizing process. The main object is to effect a perfect desulphurization, in order to set free the gold. Generally no loss of gold is suffered during the roasting, neither with iron pyrites, nor with arsenical pyrites, although exposed to a considerable heat and for a long time. Many manipulators, however, who have had much experience in roasting gold sulphurets, complain of considerable loss of gold with some kinds of sulphurets, which they could not avoid in spite of all experiments made with reference to heat and general treatment. It is therefore always advisable to investigate the loss of gold with new sulphurets by assay.

The simplest way to ascertain whether the loss occurs in roasting or otherwise, is to weigh out one-half ounce of the well-sampled and dried sulphurets before charging the furnace, then another half ounce after roasting. But the sulphurets, after roasting, weigh a great deal less than before, having exchanged the heavy sulphur for the lighter oxygen, and the

the nail as described, the time which would have been consumed in roasting is saved, and the result perfectly reliable; but samples of arsenical pyrites copper sulphurets, or iron pyrites containing arsenical pyrites, must be subjected to roasting.

The plan here detailed is that recommended by the late Guido Kustel. Iron sulphurets, well concentrated, require only a perfect oxidizing roasting to give a satisfactory result in the subsequent chlorination; but if lime, tale or clay is with the sulphurets, an addition of salt in small quantities, 20 to 40 pounds to the ton, is necessary, otherwise the precipitation of gold is sometimes very troublesome; and as the presence of salt is not injurious, it is always better to use some salt with the sulphurets. The quantity of salt must be increased if silver should be present. For the roasting of sulphurets, the reverberatory furnaces are usually used.

The Postal Telegraph.

Hon. Charles A. Sumner, M. C., has kindly sent us a print of his address to the House of

Disparaging Mines.

A gentleman came from the East not long since in the interest of certain capitalists to look into the condition of some mining property belonging to them in a Nevada district. He expresses himself as having been very much annoyed by parties who came to him soliciting him to buy mines from them, each one insisting in every instance that nobody's mine was good for anything except the one he offered for sale. However, he was not impressed favorably by having people run down every mine in the camp, as it looked as if all were worthless.

There is little doubt that altogether too much of this sort of thing is done. Let a man once think of buying a claim and he will hear all sorts of damaging statements about the property, circulated by people who have other claims to sell, or are jealous of the good fortune of their neighbors. They forget that in doing this they also hurt their own claims by injuring the reputation of the district. Almost every man who has had any experience in the mining camps of this coast knows that the sale

of a piece of mining property to capitalists who will develop it and put up works, is the one thing which brings a camp such prominence and gives it reputation. When one mine is thus sold, others are given a value they did not previously possess. We all know how camps have languished for years, until men of means came and bought a mine, that it immediately attracted general attention. But when a lot of miners deliberately set to work to abuse a property because it is going to be sold, they frighten off the intended purchasers, and not only do harm to the other mine owners, but to themselves as well. Of course every man has a right to do the best he can to sell or develop his property; but it is poor judgment to pull down somebody else's to build up his own. When a man hears every mine he looks at or knows of set down as worthless by others, he cannot tell when the truth is told. He naturally

becomes suspicious of all. No doubt very great harm has been done more than once in this way by unthinking men, who, in endeavoring to help themselves, have hurt the whole community. People should be careful what they say under such circumstances. The mere hearsay of the camp is not always to be taken as the truth, by any means.

Comet Ore Crusher.

The engraving on this page is a sectional view of the Comet ore crusher, manufactured by Fraser & Chalmers, of Chicago. Some five sizes of these machines are made, to crush from four to sixty tons per hour. The discharge is quite large, so there is no clogging. The shoes and dies are removable. The construction and operation of this machine are quite plainly shown in the engraving, so that no detailed description is called for. The manufacturers intend the machine to crush not only ore, but street macadam, railroad ballast, etc.

FREIGHT on crude copper ore from Butte to Liverpool now is \$29 per ton. The former rate to Baltimore alone was \$43. Thus the difference in transportation charges goes far towards equalizing the depreciation in the market price of copper.

The lowest the mercury reached at Eagle City during the winter was twenty-two degrees below zero.

THE COMET ORE CRUSHING MACHINE.

gold, therefore, appears concentrated in the smaller weight of ore. For this reason it would be improper to take half an ounce of the concentrated and compare it with that of the original not concentrated sample.

In this case, if half an ounce of the roasted ore were assayed, the number of ounces would come out higher, and the actual loss either covered, or the gold would seem to increase in the furnace. If salt is used in roasting sulphurets, it is generally charged in the last hour, and the sample should be taken just before the salt is added.

The weighed sample of the raw sulphurets is introduced into a No. 8 French crucible, in which a mixture of one ounce of soda and one ounce of litharge are previously placed, and then carefully mixed with a glass or an iron rod. After this a 20-penny nail is inserted into the mixture, and the whole covered with about one ounce of borax. The other sample of roasted ore is also introduced into another crucible, having, in addition to the soda and litharge mixture, eight grains of powder of charcoal, well mixed, and covered with about one-half ounce of borax in small pieces, no nail being required. Both crucibles are exposed to a good heat in a furnace for fifteen minutes, the covers being taken off, the nail carefully taken out with the cupel tongs, the contents of the crucibles taken out and the buttons cupelled. Using

Representatives on the subject of the postal telegraph, from which we can see that he gave the old monopoly a pretty vigorous shaking up, and at the same time put in some strong points in favor of the new method of cheap communication. Among other things he showed by special report from the Superintendent of the British Government telegraphs that the British system has paid a considerable profit, that the public use of it has continually increased, and, in short, that the proposition as advanced in bills now before Congress is practicable as shown by actual experience in various countries. Of the disposition of the people toward the measure, he says: "The fact is, tested by the experience of Great Britain alone, that the establishment of a Government postal telegraph under such measure as the one before me would bring to the hearthstones of the people such enlarged facilities for intercommunication as a postal telegraph presumes and provides, with a small outlay supplied by the people themselves and gladly and joyfully paid into the Treasury of the United States; a comparatively trifling construction expenditure, to be ultimately and quickly returned from the profits of a telegraph line worked under the supervision of the Postmaster-General of the U. S." Again he says: "There is a picture of the political and the social and the intellectual and the moral advantages which would spring inevitably—ever-enlarging in their beneficence—from the establishment that is now sought at your hands. What a web of amity would be woven by this lacing and interlacing of electric wire!"

The Leaching Process.

An Experimental Working of Silver Ores.

J. H. Clemes, of Sonora, Mexico, read the following paper before the American Institute of Mining Engineers:

The process of leaching silver ores with sodium hyposulphite is comparatively new, and published accounts of the details and losses of the process are as yet very few. The following account of a careful series of experiments to determine the actual loss in this process may therefore be acceptable to members of the Institute.

The ore treated was highly calcareous, and the principal sulphide present was iron pyrites. Following is an analysis by Professor Price, of San Francisco, of the ore treated:

	Per cent.
Silica.....	15.31
Sulphur.....	13.31
Arsenic.....	9.82
Iron.....	17.33
Alumina.....	1.35
Zinc.....	4.92
Lead.....	1.78
Carbonate of lime.....	33.78
Magnesia.....	2.58

Total.....100.00
Ten tons were crushed dry with a 30 × 30 screen = 900 holes per square inch. In order to feel our way with this ore, two experimental or "pilot" charges were roasted.

Pilot Charge, No. 1.

Treated 1,000 pounds in a four-hearth reverberatory.

8:30 P. M.—Entered fourth hearth, remaining there one and one-half hours; sulphur began to burn.

10 P. M.—Changed to third hearth; ore became red-hot half an hour after entering; the fire-place was kept almost destitute of fuel.

2:30 A. M.—Changed to second hearth. Charge continued, giving off a large quantity of sulphurous fume; the fireplace was kept dark.

3:30 A. M.—The combustion of sulphur much decreased; the ore swelled a little.

4 A. M.—The mass began to lose its glow and to become dark.

Fuel was thrown on the grate-bars until the arch of the furnace was red.

4:30 A. M.—Combustion of sulphur ceased; 60 pounds of salt = 6 per cent were added. The salt was dry and finely sifted.

5 A. M.—Charge passed to first hearth, a small evolution of sulphurous acid still continuing. Although the fire was moderately urged, the chlorine fumes were not nearly as copious as could be wished.

5:30 A. M.—The amount of chlorine fume was very much decreased; the furnace was kept at a good red (*coup de feu*).

6 A. M.—The charge was considered rendered, and was drawn.

It evolved hardly any chlorine, even under a sharp fire—a marked difference from the siliceous ores that we generally treat here; the latter continue to give off chlorine fumes after being drawn, the cause being the action of the silica on the common salt, which is always present in excess.

The roasted ore assayed 245 milles = 71.5 Troy ounces per ton (2,000 pounds) avoirdupois.* By crucible assay, as often happens with ores in which the silver exists as chloride, the result by the scorification method is less; in this case the assay by the latter method was 215 milles.

Three portions of 300 grains each were treated with boiling concentrated sodium hyposulphite, and their residues assayed in the usual way; the buttons weighed .152 and .150 grains = 79 per cent and 80 per cent chloridized.

The pile was moistened and allowed to stand two days. Three hundred grains, treated as before, left a button weighing .138 grains = 81 per cent chloridized.

Pilot Charge, No. 1, b.

This was composed of:

	Pounds.
Pilot charge No. 1.....	900
Raw ore.....	200
Total.....	1,100

It was roasted in a five-hearth furnace.

3 P. M.—Entered fifth hearth.

4 P. M.—Changed to fourth hearth.

6 P. M.—Changed to third hearth.

7 P. M.—Entered second hearth.

Half an hour afterwards a very slight combustion of sulphur began.

8 P. M.—The mass received 4 per cent of salt and began to swell considerably.

8:30 P. M.—Changed to first hearth.

9 P. M.—The charge worked well, giving off a great deal of gas, swelling, and becoming spongy. A light fire was used.

10 P. M.—Strong evidence of active chlorination.

11 P. M.—The charge appeared to be rendered, and was withdrawn.

300 grains of the roasted pulp were digested with sodium hyposulphite; the residue yielded a button weighing 0.016 grains.

Repeated, 300 grains gave a button weighing 0.015 grains.

The roasted pulp was weighed after sprinkling:

First weight, 1,752 pounds; second weight, 1,730 pounds; deducting 9.88 per cent moisture = 1,569 pounds wet.

In its double passage through our furnace it

picked up other ores and dust from corners, etc.

200 pounds of this roasted pulp were placed in a small vat and treated with cold spring water for the purpose of dissolving out the soluble salts of base metals present in the pulp. A part of the liquid escaping from the bottom of the vat was caught in a bucket and the metallic salts held in solution were precipitated as sulphides by the addition of a little calcium sulphide.

The precipitate was dried, and yielded by assay 3.696 per cent silver; the operation was repeated half an hour afterwards, yielding a precipitate which contained 0.452 per cent silver.

Our usual working solution of hyposulphite was then turned on the pulp and allowed to run three days; specific gravity of solution, 2° B.

The tailings obtained assayed 7 milles = 2.04 ounces per ton of 2,000 pounds. The chlorination was further advanced by allowing the moistened pulp to lie heaped before leaching. It is still more advantageous, in addition to the above precaution, to allow the roasted ores to lie red hot as long as possible.

† It will be observed that a large loss of silver occurred in washing out the base metals, due to the solubility of silver chloride in brine. This loss will not be tolerated in treating eight and one-half ton lots, as the first wash will be suppressed. On the large scale, also, this loss can be avoided; further on we will describe the modes of effecting this.

(CONTINUED NEXT WEEK.)

Nickel.

The Ores of Nickel.

Nickel, next to iron, is one of the most universally disseminated metals. It is found not only in all the metalliferous regions of the known world, but also in the meteoric masses which fall to the earth's surface from the regions of space. Tissandier found it in the meteoric dust falling through the atmosphere, collected on a large porcelain surface, and its presence in the sun is revealed to us by the spectroscope. It thus enters into the composition of other worlds than ours; and probably pervades the solar system. But notwithstanding this universal distribution, and the apparent abundance of this element, it is only a few years since the metal was first separated from its impurities in commercial quantities and utilized in its pure state without alloy or contamination by sulphur, arsenic, or other elements with which it is universally combined in its natural state. It has never been found in a fine metallic condition.

Geographical Distribution.

The geographical distribution of the ores of nickel in the United States is more general than is commonly supposed. They occur in moderate quantity, in close association with chrome ores, in the serpentine rocks from Canada to Maryland, and equally so with the chrome ores of the Pacific coast, notably in Oregon. Dr. T. Sterry Hunt long ago pointed out the general diffusion of nickel throughout the magnesian rocks of the Quebec group. He directed attention to the fact that both chromium and nickel are almost always present in the serpentine rocks of the Green Mountain series in the same geological horizon as the serpentine of Canada and of Norway. He says, also, that the serpentines of Cornwall, the Vosges, Mount Rosa, and of many other regions agree in containing chromium and nickel, and these elements are also found in the Urchiefer, or primitive schists of Norway. Nickel is seldom or never absent from the serpentines, steatites, diallagas, and actinolites of the Quebec group, and is found also in the associated dolomites in traces and in very small quantities in the magnesian of Sutton and at Bolton, and in the Laurentian gneiss on the Assumption river.

The element is also found to be closely associated with iron terrestrially as well as in meteorites. Leaving out of view the great masses of metallic iron of Greenland (of which the Oviat mass containing nickel is a familiar example, and the meteoric origin of which is still in doubt,) we find that a nickeliferous limonite occurs in Lincoln county, North Carolina, and that similar ore is found in Michigan, from which a superior nickeliferous iron has been made. The spathic iron ore of Antwerp, New York, also contains nickel in the form of millerite, and no doubt many other examples might be found of the close terrestrial association of nickel and iron.

The ancient rocks of Michigan and the Lake Superior region are also found to contain many deposits of nickel, and several localities have been noted and partially explored, but none have yet been worked with commercial success.

Further evidence of the general diffusion of nickel, and of its abundance, in the Lake Superior region, is found in the results of analyses of the refined copper of Lake Superior. Eggleston has shown that it exists in the copper in small quantities.

In New Mexico there are localities which it is said will furnish considerable quantities of 8 per cent. ore, and important localities are known to exist in Oregon, California, and in Nevada.

The most abundant ore of nickel is in the form of a mixture with pyrrhotite or magnetic iron pyrites, which is found more abundantly in the older crystalline rocks than in those of later formation. This form of nickel ore occurs in Canada, Vermont, Connecticut, in the highlands of the Hudson in New Jersey, and in

Pennsylvania. It is abundant in Connecticut at Torrington and Litchfield, and in Pennsylvania at Lancaster Gap. These ores however seldom average over 2 per cent. of nickel as mined. Other nickel minerals of a higher percentage, but occurring in much smaller quantities, are found associated or occurring separately; as for example nicolite, containing about 44 per cent. of nickel and 56 per cent. of arsenic, at Chatham, Connecticut, together with herithanpate (nickel 31.43, timony 68.57) and chathamite, containing nickel 9 to 10 per cent., with arsenic, sulphur, and iron. At Finksburg, Carroll county, Maryland, the species siegenite (cobalt pyrites) occurs with chalcopryite, and it is cited as occurring also at Mine la Motte, Missouri. This species, which contains 29 to 30 per cent. of nickel, is found near Siegen, in Prussia, and in Sweden.

The presence of nickel in the serpentine rocks of Pennsylvania associated with chrome ores is well known by the beautiful green crusts on the massive chromite quarried at Wood's pit for the manufacture of bichromate of potash at Baltimore. These green crusts, known as "emerald nickel," consist chiefly of hydrous nickel carbonate, and are derived by infiltration from small granular nodules of nickel sulphide disseminated in the midst of a massive "violet talc" (kammererite) accompanying the chromite. Similar coatings of emerald nickel occur upon the chrome ores of southern Oregon and probably have a similar origin. This ore of nickel, though rich in the metal and very desirable, is not abundant enough to work, and has not been utilized except for cabinet specimens.

The most available ore of nickel and the only one worked up to this date in the United States is the sulphide, occurring in connection with magnetic pyrites. Although the amount of nickel rarely exceeds 3 per cent., the quantity of ore is so large and available and the sulphide ore is so readily smelted or enriched in nickel by roasting and matting that it is the most economical ore to treat for nickel. Until the discovery of large deposits of nickel silicate ore in New Caledonia, the sulphureted ore was the chief source of nickel in Europe and America, and it still continues to be worked. This is an ore which occurs at many places along the lines of the older or Archaean rocks, being found with the beds of pyrrhotite from Canada southward. The principal localities are, however, in Connecticut and Pennsylvania.

Recent Contributions to the California State Mining Bureau.

(Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKE, State Mineralogist.)

[CATALOGUE.]

- 5216. Wad (Earthy Binoxide of Manganese)—Kingston, New Mexico. Jay G. Kelley.
- 5217. Calcite—Little Jimmy Mine, Kingston, New Mexico. Jay G. Kelley.

MINE BONDED.—The Merrimac mine at Lone Mountain has been bonded to San Francisco parties in the sum of \$10,000, and if nothing happens work will soon be commenced on the property and the mine opened out. It is undoubtedly a good mining property, and if thoroughly developed will show up with the best of them. It will also be the means of inducing the owners of other claims in the district to develop their prospects.—Bodie Free Press.

Barytes.

Productive Localities.

The leading producing localities in the United States are in the States of Virginia, East Tennessee, Missouri, Connecticut and North Carolina. Illinois, Kentucky, Maine, and Pennsylvania also produce barytes. It was formerly mined in New York, but the industry has latterly declined, as the cost of mining was too high to meet competition. The mineral commonly known as "heavy spar," "barytes," and sometimes as "baryta," is the barium sulphate (harite). Carbonate of barium (withierite, bromilite) is not mined in this country.

Mode of Manufacture.

Messrs. Paige & Krause, of St. Louis, who own important mines near the Osage river, Miller county, Missouri, report their process of manufacture as follows: (1) sorting the ores; (2) refining with sulphuric acid; (3) "floating" the refined product; (4) packing. The Marion Barytes Works, Smyth county, Virginia, produced 2,000 net tons in 1882. The mineral is here prepared for market by (1) separating from it the gray limestone and ferruginous impurities; then (2) washing and scouring in revolving cylinders; (3) hand sorting and grading; (4) grinding in buhr mills; (5) "air-floating," and finally (6) packing in barrels. The picking and sorting are performed by boys, of whom 50 are employed. The spot value of the crude barytes in this locality is, averaging all grades, about \$12 per ton of 2,000 pounds. The business of grinding barytes is an extensive one. German stone is imported and powdered here. Messrs. Burgess & Newton, of New Haven, Connecticut, report grinding 4,000 tons of German barytes in 1882.

Production.

The following table shows the production of ground barytes in the census year 1880. It includes, however, the foreign stone which was treated in this country.

PRODUCTION OF GROUND BARYTES DURING THE CENSUS YEAR 1880.

States.	Quantities—Tons.	Values.
Connecticut.....	6,000	\$150,000
Maine.....	2,200	50,000
Missouri.....	4,425	100,000
Pennsylvania.....	1,500	20,000
Tennessee.....	465	10,485
Virginia.....	4,575	41,650
Total.....	19,165	\$371,820

The production of crude mineral in the United States in 1882 is estimated by Messrs. Page & Krause at 20,000 tons, and that of Missouri alone at 8,000 tons; and it is stated that the production could be largely increased to meet an augmented demand. The mine owned by Messrs. Davis & Hewitt, near Irvington Station, Campbell county, Virginia, reports a capacity of from 100 to 200 tons per day, and other mines also could produce more largely than at present. It is difficult to fix the average spot value for the crude mineral. Ground barytes in 1882 averaged about \$22 per ton, and the value of the crude may roughly be placed at \$8 per ton, at the point of manufacture, making a total value for the crude mineral of \$160,000.

Utilization.

Barytes is used very extensively in the arts, but almost altogether for purposes of adulteration, for which its leading use (about 90 per cent) is in replacing to a greater or less extent white lead in paint. One firm claims that a mixture of one-third white lead, one-third oxide of zinc, and one-third "floats" barytes makes a better paint than pure white lead. Paint works, however, do not generally advertise the fact that their product contains barytes, although this is, of course, well understood in the wholesale trade. It is also employed as a "filling" for general purposes, in pulp, and in making putty.

Tariff.

The duty under the new tariff on crude barytes is 10 per centum ad valorem, and on manufactured barytes one-fourth of 1 cent per pound. Of the imported carbonate 75 per cent. is used in the paint trade, and the remainder chiefly in pottery making.

SWEETWATER NEWS.—The saloons are all closed, and there is but one store with a small stock. There is at present very little money in the camp, and provisions are scarce. The weather for some time has been very fine, and it is hoped that it will continue so. Sweetwater is a good district and contains some fine prospects, among which are the Great Western, Lookout, North Star, California Comstock, Index, Kentuck, Silverado, Homestake and Lady Hays. There will be two or three mills built in the district during the coming summer, one of five stamps, in Silverado canyon, and one of ten stamps, in Sweetwater canyon. There is also some talk of one on the California Comstock. The prospects are such that we will have a very fair camp next summer. The snow is four feet deep on the level, and drifts from ten to 100 feet. We have not seen a team for more than a month and if we wish to visit our neighbors we must carry shovels to prevent getting snowbound; but, under all the difficulties, we have a good time, as all we have to do is to shovel snow, eat, sleep and dance.—Walker Lake Bulletin.

* As 1 mille is taken = 0.001 per cent, the above assay is, therefore, 0.245 per cent, or, as is often written, 245 grams per 100 kilograms.

ENGINEERING NOTES.

UTILIZING NIAGARA FALLS.—There seems, at last, to be a definite plan and determination to at least partially utilize Niagara Falls. Reports from Lockport, New York, of March 18th, says: Colonel Leonard Henkle, the inventor of a system of electric lighting which he proposes to transmit to sixty-five cities in the United States, from central batteries stationed at Niagara Falls, and run by the immense water power there, was interviewed in this city to-day by reporters. On Sunday he received a letter from a Chicago banker, who has taken \$1,000,000 of the stock, stating that he was soon coming east to Baltimore, which city he would make his headquarters. He will there take charge of the company and form a syndicate in New York City to go on with the work. Colonel Henkle is now having a cottage built at Niagara Falls, which will be ready for his occupancy in May, and he will then go there to superintend the work of erecting buildings for the batteries and digging a canal to obtain the water power. The power will be transmitted in a silver wire about the size of a straw, laid underground, inclosed in heavy pipes made of asphaltum. Such a wire, the Colonel states, can, with a forty-foot battery at the Niagara Falls end, transmit in four hours to Rochester enough electricity to light that city for twelve hours. The sixty-five cities are all over 30,000 population. Lockport and Buffalo will probably be the first places where he will introduce his apparatus as experimental points, and he expects that he will be able to make those experiments next fall. By a properly-constructed means for conservation of electric energy, he expects to overcome the resistance usually found in transmitting currents through long distances.

THE CAPE COD CANAL COMPANY have begun night work by the aid of the electric light, and have contracted with the American Electric and Illuminating Company to supply the necessary machinery and lamps of the Thompson-Houston system for this purpose. The necessity for this canal is well set forth in a long article in the Boston Herald, which, among other things in connection with the canal traffic, says: "Barges carrying 1,500 to 2,000 tons can be built for \$10,000, and require only three men to 'man' them, while a schooner carrying 500 tons costs from \$30,000 to \$40,000, and takes seven men to 'man' it. The barge is towed with half a dozen others, and is very seldom delayed. As a general rule, it can be depended upon in a day or two after shipment. But not so with the schooner. Adverse winds cause it to 'lay to,' and it is not unusual for one firm to have at one time 20 vessels, carrying upward of 10,000 tons of coal, consigned to different parties, lying at 'Holmes Hole' for a month, awaiting a change of wind, with a numerous fleet to keep them company, resulting in severe 'demurrage,' as all would arrive at their destination the same day."

AROUND THE WORLD BY STEAM.—It is seriously proposed to construct a railroad to Alaska, to connect, by ferry-boat across Behring's strait, with the Siberian Railroad system now being constructed by Russia. Such a scheme may be a visionary one just at this time; but that it will eventually be realized, and that within 50 years, is much more probable than was the construction of a railroad from the Missouri to the Pacific 30 years ago. The Russians are actually building a road across Siberia, and within 10 or 12 years the locomotive will reach one of their Pacific ports. When that is accomplished, a road from this side to meet it will become a prime necessity.

A NOVEL BREAKWATER has been built at Brighton, Eng., which is said to be both efficient and cheap. It consists of a line of buoys of triangular shape, with a sharp edge or prow toward the sea, and two concave sides. They are moored by an anchor fore and aft, each independently, and the width of a buoy between them. As each wave strikes them it is cleft in two and diverted right and left against the next buoy; and so the momentum of the waves is used, one to neutralize that of another, and it is claimed that the more violent the waves the more effectual is the action of the buoys.

THE PANAMA CANAL.—The actual situation of affairs upon the Panama canal, according to the *Revue Scientifique*, is as follows: Out of the 90,000,000 cubic meters of material that must be excavated, only 2,500,000 were removed by the 15th of October last, at which date more than 10,000 workmen were employed; but it is expected that, now that the bad season is over, 4,000,000 cubic meters will be taken out per month, while the working force will be increased to 15,000. The port at Colon is almost finished. We may still hope, adds the writer, that 1889 will see the inauguration of the Panama canal.

A NEW CABLE LINE SYSTEM.—A new system of cable line railway is to be tried in Idaho, between Hailey, the northern terminus of the Wood river branch of the Oregon Short Line, and Ketchum, a town 10½ miles distant. The pulleys carrying the cable will be above the track, which is of three-foot gauge. The necessary power is derived from the current of the Wood river, at a point where the water has a velocity of flow of 65 feet per minute.

USEFUL INFORMATION.

Simple Tests for the Purity of Water.

In suspected potable water for persons who cannot command chemical analysis, the following tests are recommended, as being generally available and reliable:

Color. Fill a bottle made of colorless glass with the water; look through the water at some black object. The water should appear perfectly colorless and free from suspended matter. A muddy or turbid appearance indicates the presence of soluble organic matter, or of soluble matter in suspension. It should be "clear as crystal."

Odor. Empty out some of the water, leaving the bottle half full; cork up the bottle and place it for a few hours in a warm place; shake up the water, remove the cork, and critically smell the air contained in the bottle. If it has any smell, and especially if the odor is in the least repulsive, the water should be rejected for domestic use. By heating the water to boiling an odor is evolved sometimes that otherwise does not appear.

Taste. Water fresh from the well is usually tasteless, even though it may contain a large amount of putrescible organic matter. Water for domestic use should be perfectly tasteless, and remain so even after it has been warmed, since warming often develops a taste in water which is tasteless when cold. If the water at any time has a repulsive, or even disagreeable taste, it should be rejected.

Heisch's Test for Sewage Contamination.—The delicacy of the sense of smell or taste varies greatly in different individuals. One person may fail to detect the foul contamination of a given water, which would be very evident to a person of a finer organization. But if the cause of a bad smell or taste exists in the water, the injurious effect on health will remain the same whether recognized or not. Moreover, some water of very dangerous quality will fail to give any indication by smell or taste. For these reasons I attach special importance to Heisch's test for sewage contamination or the presence of putrescible organic matter. The test is so simple that any one can use it. Fill a clean pint bottle three-fourths full of the water to be tested, and dissolve in the water a teaspoonful of the purest sugar (loaf or granulated sugar will answer), cork the bottle and place it in a warm place for two days. If in 24 to 48 hours the water becomes cloudy or muddy, it is unfit for domestic use. If it remains perfectly clear it is probably safe to use.

The Oil Stone.

The *Scientific American* says that twenty years ago the oil stone was found only on the joiner's bench and possibly on that of the machinist, and its sole use was the sharpening of the edges of tools. To-day its use has extended beyond this province of edging tools to that of grinding, reducing, finishing; in fact, invading the limits of the grindstone, emery, rottenstone, tripoli, and reaching almost to rouge. This stone, which is a slate known in science as novaculite—from *novacula*, a razor—is cut and dressed in hundreds of varying forms for differing purposes. In any hardware or mechanic furnishing store it may be found in all manner of shapes under the name of "slips," adapted for sharpening tools of all forms. In dentists' supply stores it may be seen in twenty or more cylindrical and circular forms, and so minute as to be used at a rapid rate of revolution even between the teeth of dental-suffering humanity. Some of these cylinders, ovoids, cones and edged wheels are so minute that a pea looks large by their side; yet they are all veritable grindstones.

In the manufacture and finishing of the metals, the oil stone, or novaculite, plays an important part. Our recent exaction as to fits and measures can hardly be filled except by the use of this stone, and it is in demand for trueing turned surfaces and planed areas of iron and brass, slowly grinding down the imperfections left by the finish file and the corundum wheel. Recently its powder has largely usurped the place in mechanics' valuation of flour of emery or emery of the highest grades. It is found that a finish "for fit" can be readily obtained by its use in much less time than that by the scraper; and that it does not leave embedded particles of quartz or corundum to keep up a perpetual wear. This material is not strictly an oil stone; it can be used with any vehicle, water, benzine, or kerosene oil; it is amenable to all of these. Perhaps its best use is with water, especially when the stone is of the harder sorts, as the Onachita.

To coat cast iron a glossy black color that will stand washing and heat, take oil of turpentine and add to it strong sulphuric acid, drop by drop, while stirring, until a syrupy precipitate is formed and no more of it is produced on further addition of a drop of acid. The liquid is now repeatedly washed away with water, every time renewed after a good stirring, until the water does not exhibit any more acid reaction with blue litmus paper. The precipitate is next brought upon a cloth filter, and after all the water has run off, the syrup is fit for use. This thickish deposit is painted over the iron with a brush; if it happens to be too stiff, it is previously diluted with some oil of turpentine. Immediately after the iron has

been painted, the paint is burned in by a gentle heat, and after cooling, the black surface is rubbed over with a piece of linen stuff dipped in and moistened with linseed oil.

SAVED BY OIL.—The use of oil in quieting a rough sea is rapidly coming into general practice by navigators. The latest case we have notice of is the following: The steam whaler *Jan Mayen*, which left Dundee in February to proceed to the Newfoundland seal fishing, returned to Scotland, having been unable to proceed on her voyage owing to stormy weather. On Monday, Feb. 18th, the vessel encountered a hurricane, in which she was thrown on her beam ends, and would, it is believed by the crew, have foundered had not the use of oil been resorted to. Three bags filled with oakum saturated in oil were hung over the side of the vessel, and in a brief space the sea, which had been washing completely over the ship, ceased to break. The captain attributes the escape of the vessel to this experiment.

TO REMOVE CLINKER IN STOVES.—The coal is to blame for the formation of clinker. The constituents of the ash of certain coals, and sometimes the stony impurities from which the coal has not been carefully freed, will, when the fire is very intense, fuse down more or less completely, and form the mass known as clinker, which becomes especially troublesome when it attaches itself to the fire brick lining of the fire-space, from which it can only be removed by the use of the hammer, and unless very carefully performed this operation is likely to fracture the bricks. The only way to avoid the annoyance of clinker is to dispense in future with a coal that is known to form it.

TO REMOVE the unpleasant taste which is frequently observable from new wooden vessels is a thing difficult of accomplishment. The *Brewing World* says that the simplest plan, and one that will succeed in most cases, is to scald them thoroughly several times in boiling water; then dissolve some pearl-ash or soda in lukewarm water, adding a little lime to it, then wash the inside of the vessel well in the solution. Afterward scald them several times thoroughly as before.

TO CLEAN marble, mix one quart of a pound of soft soap with the same of pounded whiting, one ounce of soda, and a piece of stone blue the size of a walnut; boil these together for fifteen minutes, and then, while hot, rub it over the marble with a piece of flannel and leave it on for twenty-four hours; then wash it off with clean water, and polish the marble with a piece of coarse flannel, or what is better, a piece of an old hat.

GOOD HEALTH.

Charcoal.

An Iowa correspondent, who says that he is a "nervous dyspeptic," a "regular old chronic back-slitter for fifteen years," asks the following questions respecting charcoal:

1. Is one kind of wood better than another for charcoal?
2. How is it best prepared and kept for use?
3. How much is a dose?
4. When best taken, before or after meals?

ANSWER. 1. The best charcoal for medicinal purposes is that made from hard wood. Charcoal from lignum-vita, or box wood, or the shells of cocoanuts, is superior to that made from other woods. Very excellent charcoal, however, is made from hard maple. We have been experimenting with charcoal made from hickory, for some months, and are thus far better pleased with it than with any other which we have ever tried. The best charcoal obtainable at drug stores is willow charcoal.

2. It should be thoroughly burned. The ordinary charcoal requires to be burned the second time before it is fit for use. It should be ground to a fine powder, like flour, and kept in tight bottles.

3. A dose may be from one-third of a teaspoonful, to two teaspoonfuls. It is best taken in gelatine capsules, or in water. When taken in water, the charcoal should be placed in a tumbler, and a few drops of water added, sufficient to make a thick paste. One or two teaspoonfuls of water may then be added, and the whole stirred up and taken at a single dose.

4. Charcoal, when taken to relieve acid dyspepsia, or to prevent fermentation or flatulence, should be taken within one-half hour after eating.

The Dangerous Fly.

We have had much sympathy for the fly, says *Good Health*, believing the little creature to be a pretty good sanitation on account of the avidity with which it devours germs, as it consumes prodigious numbers of them; but if what Dr. Grassi says of these little creatures is true, we must cease to defend them, and begin a war of extermination. We present the following facts at the present time, so as to give an opportunity to prepare for protection against these newly discovered enemies of life and health:

It was always recognized that these insects might carry the germs of infection on their wings or feet, but it was not known that they

are capable of taking in at the mouth such objects as the ova of various worms, and of discharging them again unchanged in their feces. This point has now been established, and several striking experiments illustrate it. Dr. Grassi exposed in his laboratory a plate containing a great number of the eggs of a human parasite, the *trichocephalus dispar*. Some sheets of white paper were placed in the kitchen, which stands about ten meters from the laboratory. After some hours the usual little spots produced by the feces of flies were found on the paper. These spots, when examined by the microscope, were found to contain some of the eggs of the *trichocephalus*. Some of the flies themselves were then caught, and their intestines presented large numbers of the ova. Similar experiments with the ova of the *oxyuris vermicularis* and of the *tenia solium*, afforded corresponding results. Soon after the flies had some moldy cream, the *odium lactis* was found in their feces. Dr. Grassi mentions an innocuous, and yet conclusive, experiment that every one can try. Sprinkle a little lycopodium on sweet-cured water, and afterwards examine the feces and intestines of the flies; numerous spores will be found. As flies are by no means particular in choosing either a place to feed or a place to defecate, often selecting meat or food for the purpose, a somewhat alarming vision of possible consequences is raised. Dr. Grassi invites the attention of naturalists to the subject, and hopes that some effectual means of destroying flies may be discovered.

HOW TO GIVE AN OIL-BATH.—The oil-bath should always follow another bath of some sort. It may be a tepid sponge, a hot sponge, a saline sponge, tepid or hot, a salt glow, or almost any other form of bath. While the skin is still moist and supple from the bath, the oil should be applied and well rubbed in. It is well to begin with the extremities, so as to secure a thorough circulation of blood in them. The oil should be rubbed in by friction of the surface, and gentle kneading with a movement similar to that employed by fullers in working their goods. After the whole surface has been treated in this manner, the flesh should be wiped with a clean, dry towel to remove any surplus of oil. The best oil for this use is refined cocoanut oil. It cannot usually be obtained at drug stores in a fresh condition, but should never be used when in the least tainted with the odor of decomposition. It may be obtained in quantity of druggists in the large cities, and if kept in a cool place, and covered with lime-water, will remain sweet for a long time. It may also be preserved by melting and corking tightly in small bottles, each of which should contain only a sufficient quantity for a single bath. Pure olive oil is also excellent for this purpose, but it is less limpid and agreeable to most patients than cocoanut oil. Vaseline, cosmoline, oil of petiole, and other petroleum products, are not to be recommended. Most unwholesome of all is lard in any form. Cottonseed oil is not objectionable to some, but we have reason for entertaining the suspicion that cottonseed oil is somewhat irritating in character.—*Good Health*.

WHY WE EAT.—We eat our dinner because, in the food of which that meal consists, we expect to find materials capable of replacing those we have lost in the acts and processes of life. "Food," in this view, from dry bread to Smith's choicest dainties, is only matter which the body demands for its sustenance and support; and the perfect diet is simply that which affords us the most complete epitome of our bodily belongings in most condensed form, and in a shape susceptible of ready conversion, by digestion, into ourselves. We eat, then, because we waste, and we waste because we work. There is no escape from the continual wear and tear which besets us. We receive so much food as income, and we exert so much force and give off waste matters as expenditure, our profit in this transaction consisting of the "energy" or power of doing work we obtain from our food. It is true that we eat to live; it would be a truer statement if we said that we eat to work. We begin our physiological career with work, and our dinners are the consequence of our exertion. There is, after all, a considerable savor of an admirable social philosophy in this view of matters. The knowledge that these frames of ours periodically make reasonable and natural demands, through hunger and thirst, for the wherewithal of life and work, seems to lead to the plain conclusion that they deserve good and wise treatment. There can be no hesitation in indorsing the statement that living well means, other things being equal, living long.—*Belgravia*.

A DANGEROUS WEED.—Everywhere in Mexico one finds the poisonous weed toloache, though it grows most thrifty in the tropical lowlands of the tierra caliente. It is a harmless looking plant, much resembling northern milk weed, and quite too dangerously common in a land where suspicion rules and jealousy amounts to madness. It does not kill, but immediately acts upon the brain, producing first violent insanity, and then hopeless idiocy. A few drops of the tasteless fluid, mixed with milk or other food, does the diabolical work with inexorable certainty, and cannot be detected except in its effects. It is whispered that poor Charlotte had hardly landed at Vera Cruz, on her sorrowful mission to this country, before it was administered to her, and her desolate fate is cited as one among many instances. Of all the dangers in Mexico this is one of the most appalling.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

SOUTH SPRING HILL.—Amador Ledger, March 29: This mine is increasing the number of employees. They have 12 miners at work underground. The mill is to be run to its full capacity seven days in the week. Hitherto there has been no milling done on Sundays. A commodious blacksmith shop has been erected close to the shaft, and two forges are kept going pretty steadily. The mine continues to look splendidly.

MISCELLANEOUS.—The Bunker Hill gives employment to about 70 men—more than at any time in its past history. It is paying better than it ever did. Indeed, all appearances indicate that the mine has a long career of prosperity before it. The 10-stamp mill is running steadily. About a ton and a half of sulphurets are turned out daily, which are sent to the Stewart reduction works for treatment. Reports are afloat to the effect that ore equal in richness to any heretofore taken out, was extracted last week from the upper tunnel of the Mammoth mine. It requires an expert in the character of quartz met with in that section to tell good rock when he sees it. Practical miners from other parts are at sea when inspecting a mine like the Mammoth. Mr. Nevills, however, is so thoroughly acquainted by actual experience with that sort of gold-bearing rock, that he can tell unerringly when an approach is being made to a pocket. It is generally believed that there is plenty of the richest kind of rock at various points in the tunnel waiting to be taken out when the proper moment arrives. A few days ago a chunk of ore was taken out worth several hundred dollars, and which to many experts would seem to be almost worthless, but when submitted to the action of the fire the precious metal ran out in a stream. At the St. Julian they are sinking a shaft in the tunnel, close to the pocket, for the purpose of taking out the rich ore known to lie below the tunnel level. The mill is running on the mixture of slate and quartz, which is said to be turning out handsomely. Ten tons of quartz from the Lighthouse mine near Butte City, and owned by W. E. Stewart, was crushed at the Confidence mill last week, and yielded over \$6 per ton.

Calaveras.

ANOTHER GOOD PROSPECT.—Calaveras Prospect, March 29: The claim on Bear mountain known as the Thorn mine will be put in shape soon for another season of work. Some two years ago the prospectors struck some very rich pockets and such findings continued for a time. Since the 6th of last September prospecting has been carried on quite actively and the indications for pockets are better than ever. But owing to the heavy rains work has been suspended until the surface water drains off, when the owners will sink a shaft near where the rich pockets were found. The present owners are C. W. Slayton, B. K. Thorn, Walter Knight and D. J. Demarini.

GOOD DISTRICT.—Mountain Echo, March 26: I heard it expressed by a competent quartz miner a few days ago, that in his opinion this is one of the best quartz districts in the county. He thought all we need is a few enterprising men who have capital and are not afraid to invest it; he went on to reason thus: "Let a man go to work with one thousand dollars, or probably less, (as most of them do around here) and nine times in ten his money is all gone before he gets any returns to speak of, and finally he gives up greatly discouraged; while on the other hand, let the right man take hold of most any of our quartz mines with capital to back him and a determination to go to the bottom, whether he makes or breaks, nine times in ten he will come out successfully." Most undoubtedly his theory is the right one. Since the last heavy rain storm, quartz prospecting has been carried on pretty generally, and we anticipate hearing of some big discoveries before long. Work on all the principle placer mines in this vicinity is being urged forward with encouraging results and the area of development is being steadily enlarged. It is reported that George Osborn has unearthed another rich deposit in the Gold Hill mine. A piece of gold weighing four ounces was picked up by an Indian on San Antonio creek, last week. We are credibly informed that work will soon be resumed in Bully Bully mine at Dogtown. This mine is one of the "has beens" and may be again.

GLENCOE.—Calaveras Chronicle, March 24: At a meeting of the miners of this district, held on the 20th inst., the District Mining Laws and the office of the District Recorder were abolished, and the records ordered to be placed in the office of the County Clerk at San Andreas by the President of the "Glencoe Miner's Protective Association," in whose charge they were ordered placed for such disposition.

Nevada.

STRUCK A BONANZA.—Transcript, March 27: What is described as the richest free gold ore ever found in Washington township was struck last Friday at a point 190 ft below the tunnel of the Yuba mine, to which depth the incline has been sunk since last August. The ledge is between six and seven ft wide, and increases in richness as it goes down. When the incline was started last fall it was intended to sink only 100 ft before drifting, but when that depth was attained the ledge was so large and valuable that the management could not resist the temptation to follow it down without loss of time and see how far down the good prospect continued. The Eagle Bird mine, situated near the Yuba, is said to also be looking very fine. Reliable men say that locality is going to take its place as one of the best quartz mining districts on the Coast.

BLUE LEAD.—Nevada Transcript, April 2: The pumping and hoisting machinery formerly used on the Blue Lead mine is now being put up on the Rising Sun claim, which latter promising property is situated on Deer creek east of the Murchie. The works will be run by an undershot wheel. Thirty eight men are working at the Merfield, and the prospects are encouraging. In two weeks more the water will all have been pumped out, and then the

shaft is to be sunk 50 ft deeper (giving a total depth of 950 ft) and a new level will be opened. The Neversweat is the comical name that Messrs. Lyons True and the Goyne brothers have given their claim which lies to the east of the Deadwood. A recent crushing of the ore paid \$52 a ton. Hoisting and pumping works are to be put on the Neversweat soon. The 16 stamp mill at the Wyoming is worked to its fullest capacity, and the returns are large. An old miner said yesterday, "The Wyoming is one of the best quartz claims in the county. From the 200 level to the 700 there are immense deposits of rich ore extending for hundreds of ft, and without opening another ft of ground the present mill would not be able to crush all the pay quartz in several years." At the Hussey mine in Willow valley, drifts have been started at the 200 level. The ledge in one drift is 40 inches thick and in the other three ft, and is of high grade ore. A contract will soon be let to drive the west drift ahead fifty ft. The ore now coming out is of good quality, and a crushing will be taken to the mill as soon as the roads get in good condition for hauling. Cars are being built, and if the indications continue as good as they are at present the mine will soon be worked on an extensive scale.

WILL RESUME WORK.—Transcript, April 2: It has been stated within the past few days that the lessees of the Golden Gate gravel mine at Smartsville, Ganney, Madden & Co., had obtained permission from the Superior Court of Yuba county to wash up a certain piece of ground for the purpose of paying off certain liabilities on condition that restraining dams should be put in to take care of the debris. There seems to be some truth in this as it is understood preparations are being made to commence work.

Mono.

BODIE CON.—Free Press, March 25: The west crosscut from the shaft, 200-foot level, has been advanced during the past week 14 feet, total length, 81 feet, and shows no change in the character of the ground cut through. The north drift has been driven 25 feet, showing 2½ feet of ore. Winze No. 2 has reached a depth of 35 feet. The vein at this point is 4 feet wide. The upraise on the Gidea shows the vein to be 8 feet wide. Upraise No. 1, 306-foot level, is up 14 feet, with no change to report. They have also started another west crosscut 80 feet south of crosscut No. 1. It has not yet reached the vein. North upraise, 432-foot level, is up 85 feet, showing the vein 1½ feet wide.

STANDARD CON. During the past week there were shipped to the company \$13,853 93. North drift, 700-foot level, is in 160 feet; progress 6 feet. The vein is 6 feet wide. South drift No. 4 from east crosscut No. 2 is in 12 feet, having been started during the week. The vein is 2 feet wide.

MONO.—Have been working with all possible expedition to get the machinery in proper condition for hoisting from the lower levels. A good deal of interest centers upon a section of ground which will be thoroughly prospected at once. They began hoisting last night.

SYNDICATE.—The mill is pounding away incessantly, except short interruptions for the weekly clean-up. Last week the company shipped \$6,000 to the Carson mint, which is slightly under the usual shipment.

A GOOD PROSPECT.—Homer Index, March 26: Wm. L. Callahan and Charles A. Wetmore having lost their joint tunnel in the Mariposa-Coyote claims, Jordan district, in the late snowsides, resumed work on their joint shaft, and at a depth of 55 ft have struck it rich, though as yet they are unable to tell the width of the vein, as neither wall has been encountered. They are now engaged in drifting along the ledge to get away from the disturbed portion under the ravine in which the shaft was sunk, and will soon crosscut both ways to ascertain its width. The ore is rich in free gold, carries both chloride and bromide of silver and shows traces of copper.

Placer.

NOT RUNNING.—Placer Argus, March 29: The Sacramento Bee keeps up its howl about hydraulic mining, and says that claims are being worked at Dutch Flat and Gold Run. Now the fact is that notwithstanding there has been a good fall of snow and rain this season, there has not been a water supply at either of the above named places to wash away earth enough to shoal a brooklet. For this reason, the heavy falls of snow and hard freezing at night above here have choked up the ditches and kept the water from running through to the reservoirs. The water supply up to this date has not been sufficient to keep the pulp mill in steady operation at Fowl's Mills. It is true that a few small claims might run, two or three hours a day, and work in a scratching way, as miners term it, but if so they would not wash away any more dirt than if mining by the drifting process, and large claims would not go to the heavy expense of fitting up and would not be bothered running if already fitted up. On such a meagre supply of water they could not pay wages with three or even six hours water per day—and it is fair to presume that miners are not going to work when they know they can not pay expenses.

Plumas.

TUNNEL.—Greenville Bulletin, March 26: Supt. Standart has had a few men at work for some time, running a tunnel on ground belonging to the Cherokee mine. A ledge was struck recently and some good ore found. The extent of the ledge is not yet known. The proprietors of the Eagle Gulch mine are now well advanced with a tunnel that will tap their ledge at a depth of 300 ft. The ditch will be opened to Green Mountain by to-morrow, and water will at once be turned in. Water power will then be applied to the air compressor, and steam will be dispensed with. It is not expected that the mill will be started before the first of the month. During the past week the Blake chimney has been showing up some better ore than hitherto. The prospect is good.

Sierra.

COMMENCED CRUSHING.—Tribune, March 29: Twenty-stamps of the new Sierra Buttes mill commenced crushing last week Tuesday. It is the intention of the Company to enlarge the capacity of this mill to 60 and possibly to 80 stamps as soon as the lower levels are opened sufficiently to warrant it.

RUBY.—Mountain Messenger, March 26: We hear that the Ruby Company is taking out about \$1,200 per week. The bedrock is hard and requires blasting; they are yet below grade and the water, gravel, etc., has to be raised; the gravel has to be run to the dump by hand, all of which disadvantages

entail extraordinary expense that will in time be avoided, it is hoped.

Shasta.

THE CLEAR CREEK DITCH.—Shasta Courier, March 26: Great activity prevails in the matter of locating claims under the Clear creek ditch, now that the work of putting it in repair has assumed shape. This ditch extends from the Tower House to Horsetown and with its sinuosities and side ditches, has a length of 40 miles. When in good order it carries many hundred inches of water and has on its line many reservoirs, which, when filled, assume the proportions of good sized lakes. Besides the large amount of mineral ground lying below it, there are hundreds of acres of land, which, with facilities for moderate irrigation, would produce excellent fruit, grapes and vegetables.

San Bernardino.

MINERAL LAKE DISTRICT.—Calico-Print, March 2: Mr. H. B. Stevens returned from the above named district on the 13th inst. Work on his mine, the Carbonate, is progressing in a satisfactory manner and has reached a depth of 50 ft, the vein showing a width of 10 ft all the way down. They have a car-load of ore at the railroad depot at Bagdad ready to forward to Pueblo. His is similar to the lot mentioned in our last weeks issue, 20 sacks of which yielded a return of \$116 per ton in silver and 20 per cent copper. The ore of this shipment is equally as good. Mr. Stevens has also received returns from the carload of Kearsage ore mentioned as shipped from here January 29th. They are as follow: First class ore \$1,100 per ton; allowed 95 per cent of assay value. Second class, \$448, allowed 94 per cent. Third class, \$280, allowed 93 per cent. He now asks, "Who is it that is not satisfied with that?"

WEST LAVA BEDS.—Day before yesterday Messrs McGlinchy & Keyes returned from the West Lava Beds where they have been working on the United States mine. They say the appearance of the ledge in the shaft they are sinking is looking well, and they feel encouraged that this claim may open up into a good mine. They say that the De Soto is looking splendidly and is improving as work progresses. They brought up a nice looking specimen from this mine which represents ore that will mill about \$500 per ton. They stated that Messrs. Reed & Vine have sunk 14 ft on the Garfield claim and have suspended work until they get a windlass, and are now working on the Stoneman in that vicinity. Mr. Smith and two men are at work on the Columbus and have every encouragement to expect rich returns from their labors. Messrs. McGlinchy & Keyes think that the Lava Beds is destined to be a large and flourishing camp, and that the mines there have the appearance of permanency and remarkable richness. The principal ledge can be traced for four or five miles and ore has been found in many places, some of it assaying very high, and the samples averaging more than an ordinary grade.

MORNING STAR.—Mr. I. H. Roberts, Supt. of the Morning Star mine in Lava Beds districts, called at our office the other day and presented us with three large and exceedingly rich specimens of silver ore from the above mine, which are the finest specimens we have seen from mines in this county. Work on the Morning Star is still progressing, the tunnel being run in along the vein a distance of 180 ft, the appearance of the mine improving as they advance. They intend to crosscut the ledge and continue the tunnel. There are a good many tons of ore on the dumps awaiting the erection of the sampling works that are expected to be put up in Daggett in the near future.

SPECIMENS.—Mr. S. P. Clark arrived in town from the Lava Beds last Tuesday and brought with him a specimen of rich ore from a new strike he made a few days ago on the Meteor. He discovered on the top of the ledge a deposit of ore about 12 ft wide and extending about 40 ft.

CUBA NO. 1 MINE SOLD.—From Mr. Jas. McGlinchy, of Calico, we learn that he and his partner Mr. J. N. Keyes, had recently sold one of their mines, the Cuba No. 1, to Lieut. Governor Daggett, receiving all they asked for it. This mine is situated near the Snow Bird in East Calico, and has been worked by Mr. McGlinchy & Keyes for over a year with fair profit and is still considered a valuable mine which can be operated by a company having their own mill and plenty of capital, with less expenses and give better returns than by parties with small means. Gov. Daggett has set four men to work assorting the ore on the dumps that was of too low a grade to be milled by the former owners without loss.

Trinity.

MORE RICH QUARTZ.—Trinity Journal, March 29: We learn that Meckel, Day & Enos have discovered a very rich quartz ledge on the East Fork, near Moor, Day & Co.'s location, but have no further particulars. That district is full of good quartz and we expect to chronicle many rich finds before the summer is over.

ALL BUSY.—Wm. Vollmers was in town from Trinity Center this week, and tells us that everybody in that neighborhood is at work and that prospects for both farmers and miners are excellent.

GOOD PROSPECTS.—Report says that good quartz has of late been found on Rush creek, near Jake Paulsen's place, and that the prospects are favorable for rich developments in that section.

Tuolumne.

SOULSBYVILLE.—Tuolumne Independent, March 26: The Virginia mine, about half a mile north of B. Soulsby mines, still continues to look well. The ledge is from 10 inches to one and a half ft, and contains some of the finest rock I have seen in the Co., and a great percentage of sulphurets and lead. Where it is not all sulphurets the gold can be seen in large quantities. This mine is situated west of Arasterville, and shows the best prospect of any mine in or adjoining Arasterville. The Buchanan mine has a ledge about 11 ft, more or less. A miner states the rock will pay \$20 per ton. Wm. Symons is taking the water out of the Louisiana mine. This mine is continually in a wrangle—working a while and shutting down, and many men who have worked there have lost their money. We hope Symons will keep it a-going good and not do as others have done. Mr. Hyde is preparing to start his mine and mill in full blast. The mill is a one-stamp battery, weighing 1,000 pounds. The ledge is several ft wide, assaying and prospecting well. The old Soulsby mine is again free from water, and they are sending up splendid

rock. It is said that Wm. Johns of Amador is coming to report the mine to the company at London, Boyle, Lander and Summers have a ledge near Summersville which averages two and a half or three ft, and prospects well. Another claim on the same lead, about 10 inches, which also looks very rich to the proprietors. And on Mt. Eaton, a mile from the above mine, these parties have still another claim, which is said to be good. The 10-ounce piece said to have been found on the premises must be taken with a little Worcestershire Sauce.

NEVADA.

Washoe District.

UTAH.—The northeast drift on the 1750 level was extended 378 ft, when wet and very soft ground was encountered, and work was discontinued. Until this ground has drained out, it is liable to slide or cave and it would be difficult to keep up. During the past week the principal work has been in the way of repairs to the 1950 station. A chamber is now being cut out for a fan, and next week they will be able to commence prospecting operations at this point.

SIERRA NEVADA.—The northeast drift on the 3100 level—now running north—is out about 275 ft. It shows about the same character of vein material as heretofore. The ground is quite dry. The fan at the 2900 is running and is sending air down into the north drift on the 3100 level.

HALE AND KOKROSS.—The southeast drift is making excellent progress. It is being pushed as rapidly as possible to the point where it will connect with the west drift from the Combination shaft. This connection will now soon be made, when active prospecting may be commenced at several points.

MEXICAN.—Good headway is being made in the winze just being started on the 3100 level, some 50 ft to the eastward of the main south and north drift.

UNION CON.—A diamond drill hole, joint with the Sierra Nevada, is being run west from the bottom of the winze at the 3100 level. The east crosscuts are being allowed to drain out, drill holes having been run in far enough to tap the wet streak of ground lying on that side.

CON. VIRGINIA.—The guides have been placed in the joint California winze from the 2700 to the 2900 level, and preparations are being made for drifting on the latter level to connect with the main north and south drift.

ALTA.—The ground in the face of the east drift on the 2150 level is working very well. The west drift is in favorable vein material, showing occasional streaks of quartz that carries some metal.

CALIFORNIA.—The guides have been placed in the joint Con. Virginia winze, and preparations are being made for drifting on the 2900 level.

OPHIR.—Are still extracting ore from the 150 and 250 levels. The exploring drifts and winze (below the 250 level) are making the usual progress.

BEST AND BELCHER.—Very fair progress is being made on the 2700 level, but it is still very hot, and must continue so until an air connection is made.

YELLOW JACKET.—Sufficient ore is being taken out to keep the mills on the Carson river running to their full capacity.

ANDES.—About the usual quantity of low grade ore is being found. The prospecting drifts are promising well.

CROWN POINT.—The usual amount of ore is being extracted, and all the mills are running regularly.

IMPERIAL.—Some ore that will pay for working is being found in the explorations on the old upper levels.

BELCHER.—The usual quantity of ore is being extracted and sent to the mills on the river for reduction.

American District.

SILVER.—Silver State, April 1: L. F. Dunn is developing a silver mine discovered by him in American district, south of the Eagle mine, in Spring valley. The ore is high grade, and he intends to have several tons of it worked as soon as the roads get good.

Bullion District.

CAPITAL WANTED.—Battle Mountain Messenger, March 24: Bullion is one of the mining camps in this state that stands on its merits. The majority of the mines have paid from the beginning. There has never been any great amount of capital expended in the development of the mines, and most of the nine owners being poor men, who have been compelled to make their prospects pay from the beginning or abandon them. With a little capital Bullion would become one of the finest mining camps in Nevada, and were it in Idaho or Arizona, it would be talked of by the press as a great discovery. We have no doubt that Bullion has more real merit to-day than the Coeur d'Alene and many other mining camps a distance off which are being sought after by so many people.

MINING NOTES.—Foothill Tidings, March 29: Good ore is coming out of the upper tunnel of the North Banner. The New York Hill company are still drifting in the No. 11 level. There is no change in the appearances of the mine since our last report. The Peabody resumed work several days ago, under the direction of Richard Moore. On Friday the water was all out of the mine, and drifting on the ledge commenced. The Pittsburg mine, owned by Samuel Granger & Co., is still being worked. The tunnel is now within about 120 feet of the shaft, and it is thought that the tunnel will be completed in about two months. When the tunnel is finished, steam will be started and rock crushed. The Idaho is still looking well, and still keeps up its regular lick of paying a dividend every month. Monday next is the regular pay day of the Idaho company, and instead of giving the men their coin at the mine, as has been the custom, they will be paid at the railroad office, over Coleman & Glasson's store. There is no change in appearances at the Empire. The mine is looking as well as ever. The company are working six levels, and from all of them pay-ore is extracted. The shaft is still being sunk, and is now down nearly 1,500 feet. There is a 3-foot ledge of good ore in the bottom of the shaft. Yesterday the Rocky Bar mill completed a crushing of 36 loads of rock from the Magenta mine, and from the batteries got 205½ ounces of amalgam, which, it is estimated, will be worth \$6 per ounce. At our going to press,

the amalgam is being retorted. This is a time showing for the Magenta, but is nothing more than was expected, as the rock has been looking well all the time. The Wintfield Scott mine, owned by Michael Roach, and situated near Alton Ranch, is showing a good ledge. The company now have about 100 tons of ore on the dump, which will be crushed as soon as some of the custom mills can get time to run it through. It is estimated that the rock taken from the ledge will yield \$35 per load. The last crushing from this ledge paid \$28 per load. The shaft at the Imperial is now down 200 feet, and the company began drifting east and west, on Thursday night. The pumps handle the water very easily in this mine only four pounds per day being required to pump the water out. Seven men are now at work on the Imperial, and are making good progress. About the end of next week the ledge will be cut, the general quality of which is good.

Belmont District.

BELMONT.—*Courier*, March 29: Work on 200 level south is progressing well. Total length of drift to date, 379 ft; shows a well-defined ledge 2 ft wide of extra good quality of milling ore. No. 3 slope is 22 ft above 200-foot level, and will connect with air chute from slope No. 2 in two days. In slope No. 2 are stripping ledge, and will commence taking out ore this week.

Columbus District.

COLUMBUS CO.—*True Fissure*, March 29: Since the date of the last report the usual amount of work has been done on the different levels in the mine. The crosscut from the fourth level station has been extended 15 ft, making a total length of 50 ft, and the broken up vein matter still continues in the face. In the west drift from the south crosscut on the 150 level work has been discontinued, and work in the east drift from the same point was resumed; a quantity of 560 ore is being extracted from this drift. No work of note has been done on the first level lately.

MOUNT DIABLO.—During the past week winze No. 5 has been sunk nine ft, its total depth being 113 ft. It shows a little ore in the bottom. In the intermediate, between the second and third levels, 20 ft of south crosscut have been driven without finding anything of value. The south crosscut, from the east drift on the second level, is in 88 ft and shows small spots of good ore that looks encouraging. The west drift on the second level has been advanced 14 ft and shows low grade ore. In the intermediate, between the first and second levels, there is some six to eight inches of ore in an east drift.

Central District.

LOOKING WELL.—In Central district, west of Mill City, the Locomotive and Railroad mines are looking well, and are sufficiently developed to supply a ten stamp mill with paying ore steadily.

Eureka District.

THE BOWMAN.—*Sentinel*, March 26: The syndicate of Boston capitalists, who own the Bowman and several other mines in Eureka district, sent out one of their own number, Colonel Wiley, to look into the condition of their property. This gentleman, though candidly stating that he knows nothing of mines or mining, is a business man of experience. He spent about a week looking after the interests of his company here, and went away yesterday morning satisfied with the outlook to such an extent that he will advise the expenditure of \$100,000, if necessary, for the prospecting and development of the mines referred to. This is gratifying, and, we believe, from the knowledge we have of the properties, that no money will be lost in economically working them.

Sacramento District.

HUMBOLDT QUEEN.—The Humboldt Queen mine in Sacramento district is being worked right along, and several carloads of ore, of which there is said to be hundreds of tons on the dump, is being shipped to Denver for reduction.

Star District.

ORE.—At Star, Woolcock and Phillips are working the Grizzly mine, and taking out considerable ore that averages over \$7,000 to the ton.

Willow Creek District.

ATTRACTING ATTENTION.—The Willow Creek mines are attracting considerable attention, and Eureka men who are now personally examining some of the leads, will probably commence developing some of them in a few weeks. The mines are extensive and are situated on the other side of the mountain from the Paradise mines. A number of very promising locations have been made in the district, and the Ohio, the only mine that has been worked to any extent, has yielded its owners thousands of dollars from ores shipped to Salt Lake.

ARIZONA.

QUHOTOA.—*Prospector*, March 22: The mines on Ben Nevis mountain are quietly being opened up. The bluster that usually characterizes the development of mining properties in other districts is notable for its absence. The three shifts that have been working since developments commenced, have, in a steady manner, progressed the work in the tunnels and winze. The rock through which they have been working has from the offset been exceedingly hard. Mr. Smith daily visits all the tunnels, notes the development, and proffers advice when necessary. It is that gentleman's conviction that the properties are without peer on the Pacific slope.

PEERLESS.—The Peerless tunnel No. 1, east side, is in 90 ft. The country formation is much softer, and is heavily stained with iron. Work is being pushed very rapidly under the circumstance of soft rock. Tunnel No. 2, west side, now penetrates the mountain 82 ft. Streaks of quartz are becoming more frequent, and rapid headway is being made through softer ground.

PEER.—Tunnel No. 3, on the west side of the mountain, has attained a depth of 75 ft. The same peculiarities that characterized the country formation last week, are still noticeable.

CROCKER.—Tunnel No. 4, east side, is in 64 ft. There is no material change in ground.

HORSE MOUTH.—The Horse Mouth cut in the Peer mine, measured on the 14th inst., 14 ft. Good grade ore is being taken out.

WINZE.—Work on the winze is progressing rapidly through, it is said, high grade ore. The depth is at present writing not known.

SHEEP NEST MINE.—It is rumored that a large

body of high grade ore has lately been struck in the tunnel of this mine. The report is undoubtedly true, as ore was taken out from the face of the cliff where initiatory work was commenced on the tunnel that gave excellent assays. It is an established fact that ore exists in Ben Nevis mountain at a depth of 450 ft, this being the difference in height between the tunnel in the Sheep Nest and the apex of the Crocker.

MOHAVE.—*Miner*, March 29: Mohave county is not half prospected yet, and new strikes are being made every day or two. Five tons of ore valued at \$2,000, were shipped from the new mines in Grooms Peak district on March 22d. Tom Burke has discovered some very rich copper claims in Gold Basin, and has some specimens of the ore on exhibition in the Recorder's office. The miners working in the neighborhood of Grooms Peak in the old Aubrey district, have organized a new district under the name of Grooms Peak district. Jack Johnson has recently shipped two lots of ore from the (C. O. D.) mine near Stockton hill, to the sampling works at Kingman. One lot worked 222 ozs. in silver to the ton, and the other 190 ozs. The new shaft on the dividing line between the Schuykill and Elkhart mines at Chloride, is down about 45 ft in good ore. There are eleven men working on this mine. Messrs. Davis and Potts have shipped thirty tons of ore from the Elkhart mine to the Benson smelter. They have about sixty tons of ore now on the dump, all of which is the product of twenty-five days work. They have five men now at work on this mine.

COLORADO.

NOTES.—*Georgetown Courier*, March 27: Fifty tons of ore were shipped from the Kitty (Lyde mine last week. Some of this ore returns over 600 ounces per ton. Duncan & Foster have opened up a good body of ore in the Wolverine lode, Democrat mt., which mills 200 ounces silver per ton. A number of car-loads of machinery for the Golden Leaf mill, on Soda creek, arrived last Friday. It is being placed in position. Joe Niebauer, on the No. 5 lode of the Pay Rock mine, is sinking from the lode, and has a streak of mineral about two inches wide, which runs 230 ounces silver. A fine body of mineral has been uncovered by the lessees in the 52-foot shaft on the No. 2 Joe Reynolds, on Silver creek. The ore mills 255 ounces silver per ton. Spieles & Co., lessees on the Choctaw, had a mill-run last Saturday, the first-class of which returned 150 ounces silver per ton and 65 per cent lead; second-class 71 ounces silver and 33 per cent lead. A strike in the east workings of the 13th level of the Terrible recently opened up an ore body of nearly 18 inches in width. The Silver Ore shaft will be sunk and a level run from which stopping will be done. The shaft which has been sunk on the Norway lode, has paid expenses of sinking from the grass-roots. Stopping is expected to open up large bodies of ore. The ore runs from 525 to 1,000 ounces silver per ton. Bates & Co., lessees on the Bismarck, have finished opening up their ground and commenced stopping. They have sunk 40 ft of winze and run a 30-foot drift, and have commenced stopping at the end of the drift. In sinking the winze much of the ground yielded \$63 per foot, and it is reasonable to suppose that they have some excellent stopping ground.

THE JOE REYNOLDS.—There is not a property in this county that has made more rapid strides of progress in richness and yield in the past year than the Joe Reynolds. It is now one of the most valuable and productive mines of its locality. Nearly every lessee on it is in good pay. Moore & Co. had a mill-run, this week, which returned over \$7,900 for three weeks' work of four men. In sinking their shaft, it has paid, in this time, \$120 per foot. It is now down the full depth—60 ft. Digney & Co. have their shaft down 20 ft, and 10 inches of ore and quartz is shown, which looks favorably.

IDAHO.

MINING SALE.—*Wood River Times*, March 26: News comes from London, England, that an organization known as the Bullion Mining Co. has been formed there, with a capital of \$7,000,000, divided into shares of \$5 each, to purchase the Bullion-Ophir group of mines, at Bullion, near Hailey. The experts who have examined the property on behalf of the purchasers have variously estimated the ore in sight to be worth from \$50,000 to \$2,000,000 net—that is, clear of all expenses. The experts visited the mines last year. Since that time they have been steadily developed, and now show a much larger quantity of ore than ever before. On two or three occasions, heretofore, this exceedingly valuable property has been reported sold to an English syndicate, but the sale always failed to take place. Now, however, there seems to be no doubt that it will change hands—and very soon, too. This sale will mark a new epoch in the history of Wood river. During the past two years the Muldoon sold for \$100,000; the Narrow Gauges for \$80,000; the Silver King for \$125,000; the Mayflower for \$375,000; the Minnie Moore for \$500,000, etc. But all these were only prospects, and brought prospect prices. Now, however, we have a property that is going to sell for over \$7,000,000. Whenever \$7,000,000 is paid for a mining property, in any district, that district has become a permanent one, and its properties cease to be "prospects," and become ranked as "mines." That is how this sale will mark a new epoch on Wood river. In future, our mines will be worked for permanent returns, and not for the sake of a few tons of ore with the proceeds of which the producer may be enabled to spend the summer in Salt Lake or elsewhere.

THE LION MINE.—*Ketchum Keystone*, March 24: Authentic news comes from Vienna that the main tunnel of the Lion mine now in 100 ft is working in ledge matter and supposed to be within 20 ft of the ore vein. Hollow and mysterious sounds come from the head of the works which cannot be accounted for unless caused by the proximity of some portion of the Vienna mine adjoining. This, however, is only probable. The Vienna and Lion mines have long been supposed to be upon one and the same ore vein, in fact it became so evident last fall that the Vienna and Lion companies beheld the necessity of establishing boundary working lines, which they did through compromise.

THE BLACK HORSE MINE.—The Black Horse mine situated on Boyle Mountain about fifteen miles west of Ketchum and operated by a Boston company with Wm. Floyd, superintendent, has been doing fine work all winter, and has developed magnificent ore bodies. About 500 tons of first-class lead ore are

now on dump, filling a large log ore-house, and under the present rate of progress it is estimated that 1,000 tons or more will be ready for the smelters by May 1st. The ore vein is from six inches, the narrowest place, to six feet, the widest place, in width, and the stopping ground now developed is extensive. The Black Horse is thus destined to figure prominently as a new contributor to our home smelting industry, and will assist very much the increased value of our bullion export for 1884.

COEUR D'ALENE.—*Nugget*, March 26: It is impossible at the present time to give much authentic information relative to richness of the placer diggings. The "Widow" has unquestionably yielded from \$2 to \$20 per day to the man. The aggregate amount of dust taken from the claim exceeds \$18,000. The Peter's claim only run about three weeks, and cleaned up from \$10,000 to \$12,000, according to the statement of Dr. Campbell, who was in a position to know the facts. W. E. Cole saw one lot of dust weighing \$300, which the parties asserted had been washed out by three men in three days, the work having been performed in six inches of water. Eleven claims have lines of sluices and are said to be down to bedrock. These are the Widow, Ives, Hapenstall, Wyant, Macomber, Campbell, Points & Co., McQueen, Moscow, Geo. Murray, Rockford Co., and Allman & Co. On all these claims, and many others, work is now progressing. Drainage ditches are being cut, and sluices are being placed in position. The "Widow" claim is now in shape for mining, and pay dirt is being washed. On Bear gulch and all the numerous tributaries of Pritchard creek, the miners are busy at work. A few weeks will solve the problem fully, and gold dust will either be plentiful in the various camps or else the mines will be voted a failure so far as placer diggings are concerned. No fears are entertained regarding the result by those whose money is invested. On the older claims it is boldly asserted that the question has been fully decided, and the answer is, "there's millions in it."

MONTANA.

THE PARROT.—*Inter-Mountain*, March 21: The smelting capacity of the Butte reduction works is being constantly increased. The Colorado smelter, which two years ago was running but two stacks now has six in operation; the Montana smelter, which three years ago was treating about 25 tons of ore daily, now has facilities for treating 125 tons a day. It has five matting furnaces and one blast furnace. The erection of still more is in contemplation. The Parrot company has kept fully abreast with the others. Its co-concentrating facilities are now perfect and the number of furnaces has been so increased that 80 tons of ore per day are now being reduced. It averages 20 per cent. copper. The company mine was never before in such good shape to insure a constant and heavy production. The ore output now is 110 tons per day, two-thirds of which is put through the concentrators. Mr. Franklyn Farrell, who is one of the heaviest stockholders in the concern and who with Mr. A. F. Migeon, the former superintendent, who is now in this city, told a reporter to-day that an additional matting furnace will soon be erected, which will increase the daily smelting capacity to fully 100 tons. The Parrot company is one of the solid institutions of the camp and there can be nothing more gratifying than the confidence of its managers in the future of the property as evidenced by past expenditures and future intentions.

THE CABLE MINE.—*Inter-Mountain*, March 26: From Superintendent J. C. Savery, of the Cable mine, it is learned to-day that during the past few months it has been thoroughly timbered and is now in splendid shape for continuous operation. On the 300-foot level drifts are being extended which have opened up vast ore supplies, the extraction of which, on a large scale, will soon begin. The mill will be fired up in about two months, and will thereafter run uninterruptedly. The company is now working about twenty men. The Pyrenees mine and mill are running as usual, and at a profit. It is believed, however, that the sale of the property has fallen through, owing to the misrepresentation made to the owner of the mine by a certain party who claimed to control unlimited capital. However, there is more money in working the Pyrenees mine than in selling it, and the failure of recent negotiations is regarded by those who understand the merits of the mine as an extremely fortunate thing for Mr. Cameron.

BULLION.—*Helena Herald*, March 20: Two large bars were received this morning for shipment by the Merchant's National Bank of Helena, of the value of \$12,000. The bars contain about \$5,000 gold and \$7,000 silver, and were refined from ore taken from the lead at the end of the Maskeleyne tunnel in the Drum Lummon mine.

NEW MEXICO.

ORGANS MINES.—*Cor. Rio Grande Republican*, March 29: Jenkins and Robinson are taking out good ore from the Little Buck, which they are sacking for shipment. It will average say \$400 or \$500 per ton. Clark and Brown's El Dorado is down 40 or 50 ft in galena and sulphurets. It shows up good ore, but the ledge is somewhat broken. The vein is three ft wide, and they are now getting down to a more solid foundation. H. Willman's claim is down 10 or 15 ft, and the vein is about three ft wide. The mineral is the same as in other claims in that district, viz: chlorides and sulphurets. It is a contrast between slate and granite, and is an A. No. 1 prospect. The Foy brothers are working on a claim owned by them near the Galloway, the name of which we did not learn. They have a lead about two ft wide, and the ore assays \$900 to \$200 a ton, and is the same chloride and sulphurets ore that is found in all the claims in that district. The pump of the Memphis is ready for operation, but is at a dead stand-still. The old boiler that is to run it, and the new patch to put on it, are lying there side by side, but there is no one there to combine the two. Col. J. S. Crawford has returned to the Galloway, where he proposes to sink down to 100 ft at once. He is enthusiastic over the brilliant future in store for the Organs, and proposes to establish a new townsite right by his mine, and, as soon as sufficient development is done, to establish reduction works there. He has already, we are told, ordered a mile and a quarter of iron pipe to bring water to the mine from a spring that distance away. At the new working of the Memphis claim, a short distance up the hill from the late rich strike, at a depth of perhaps 30 ft, they have discovered a large

cave or chamber, the walls of which are coated with a thin scale of native copper. We did not learn the dimensions of the cave, but on one side of it is a sort of natural shaft descending to an unknown depth.

KINGSTON.—*Cor. Los Vegas Gazette*, March 22: The camp will now soon be able to decide beyond question the fact as to whether its mines will produce ore at great depth or not. Enough has been said about the wonderful "float" that is found so abundantly in this section, and now it remains to be shown that this float is only an indication of the vast wealth that lies under the surface. Deep mines are required to make a good, substantial, lasting mining camp. There are now four steam hoisting works in active operation, and as they are all being worked as fast as they can, they will soon settle this (to outsiders) mixed question; and the sooner the better, for all here have full confidence in the successful issue of these experiments, and any way the truth had better be known one way or the other as soon as possible, for if the ore is going to last we want to know it, and if it is not, it is equally essential that the truth be learned, for the good of all parties in the camp, and even in the territory. Encouraging returns are still coming in from all quarters. We hear daily of men who are quietly working their prospects, sending for ore sacks, and sacking their ore in anticipation of the completion of "our smelter." And this brings me to the most important enterprise that is being undertaken in the camp, viz: the smelter. The most of the smelters now lying idle have been put up in a heedless, wild sort of way, during a boom, without giving the matter the care and investigation such an investment requires. They are put up without first learning if there is enough available ore to run them. Then, again, they are put up by inexperienced people, and in fact there is always some excellent reason why the works should prove a failure. Then, again, money is raised to put up a smelter, but not a thought is given to the money required to run it successfully at the start. Much capital is required to buy ore, etc., to make the thing a success. The parties who propose to operate it should have about as much cash on hand when it is completed as it took to put it up. Now, our smelter is being put up by eastern parties of unlimited capital, under the direct supervision of men who have had protracted experience in the business. Careful estimates have been made of the cost of everything required. The ores to be worked have been assayed thoroughly, not only as to their worth in silver, but also as to their fluxing propensities, and the Iron King mine, which belongs to the Kingston smelting company has to-day enough lead and silver ores in its "dumps" to run this smelter successfully for a year; so that even if they did not get a pound of ore from outside mines they could get a sufficient quantity of fluxing and high-grade silver ores from their own mine. The capacity of the smelter being sixty tons a day, a person can form some idea of what kind of a mine the Iron King is; and knowing all this, it seems incomprehensible that there are prospects right in the vicinity of the Iron King, with "croppings" and indications for surpassing those that existed in the Iron King, without a stroke of work being done on them for want of capital; but this state of affairs cannot last. Once the smelter begins to work and roll out bullion, capitalists will get a better idea of the character of the mines of this section.

OREGON.

GENERAL NOTES.—*Jacksonville Times*, March 28: Simmons, Ennis & Co.'s big enterprise near Waldo is progressing. Jack Layton of Farris' gulch is making the gravel fly and will have a good run. Through the aid of reservoirs a number of miners are doing considerable work. Skeeters & Walker of Hogue hill, Josephine county, are busily at work, with favorable prospects. The miners of Foothills creek, Jos. Goldworthy informs us, are in most cases favored with a fair supply of water. The mining season will not be a long one, but most of the miners will do much better than during the past two. W. J. Stanley is reported to have struck a quartz ledge in Grant's Pass precinct, the ore from which prospects well. S. W. Forbes of Josephine county, who is mining in the Althouse district, recently picked up a 17-ounce slug of gold. It seems as if there is more snow in the mountains than usual, which will keep up the water supply for those miners whose ditches head there. The cool weather and occasional showers are keeping the water up, though not increasing it to any extent. Plenty of rain is what the miners are hoping for. Mr. Corker of Pleasant creek reports plenty of water in that region, and some of the miners are doing well. Considerable coarse gold has been picked up there of late. N. DeLamatter has both his claims near Kerbyville in operation, and having excellent ground and plenty of water, will no doubt make a big clean-up this season. A Waldo correspondent writes us that Wimer & Sons are running both of their pipes day and night. Deselles & Co.'s mine at Butcher Gulch is also being operated the same length of time.

UTAH.

REVIEW.—*Salt Lake Tribune*, March 25: The week has been a fair one in the ore and metal trade. The late snows have made it worse than ever in the hills and canyons but it is getting about time for the season to begin to open, and the beginning of operations is apparent. For the week ending March 26th, inclusive, receipts of bullion in Salt Lake amounted to \$118,394.77; of ore, \$5,360; of both, \$123,754.77. The week before the total receipts were \$101,812.52, of which \$87,922.52, was bullion. The shipments from Salt Lake City for the week ending March 22nd, inclusive, were as follows: forty cars 950,721 pounds. The Horn Silver Company shipped for the week eleven cars of ore, valued at \$33,000, bringing the total shipments to date for this year up to \$486,000. The Ontario shipped during the week 32 bars of bullion, of the value of \$32,255.12, making the total shipments of this company since January 1st, inclusive, \$386,743.75. The usual dividend of fifty cents a share is declared, payable on the 31st, aggregating \$75,000. Total of dividends this year, including the third \$225,000. The Crescent company made two shipments of ore, aggregating \$5,360 in value. There is nothing specially new from this company. The Stormont sent up two bars of silver, assaying \$3,000. The product of the Hanauer smelter for the week amounts to eight cars, \$16,540.

leather binding, \$5. These volumes, complete are scarce,
and valuable for future reference and library use.

CHICAGO FRASER & CHALMERS. ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns.

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Branton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jacketed, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. Baby Bolts for Prospecting, 4 H. P. to 6 H. P.

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Kitterer Tables, and adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail. **HALLIDIE IMPROVED ORE TRAMWAYS.** We refer to Gen. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

THE CONSUMERS' COMPANY.

295,704.—ROTARY PUMP—J. M. Wiles, Butte City, Cal.
295,710.—SIDEWALK CURB AND SURFACE CASE FOR ELECTRIC WIRES—Richard Wylie, Napa, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

MACHINE FOR THRASHING AND SEPARATING GRAIN, PEAS, ETC.—Alfred Swingle, S. F. No. 295,305. Dated March 18, 1884. This machine for shelling peas, beans, etc., separating coffee, rice or oats from the exterior, consists in a combination of devices. The peas or other article being fed from the hopper into the concave, the cylinder rotates with the elastic diamond-shaped projections upon its surface in close proximity to the similar points on the concave. This latter is caused to reciprocate transversely to the line of rotation of the cylinder, and the effect on the pea-pods is to roll and burst them, so the peas will fall through holes on to an inclined belt and are discharged. The peculiarly actuated, elastic, rubbing-surfaces are very effective in denuding rice or oats of their husks, the elastic points being made smaller and both surfaces being imperforated, so that the grain and husk are discharged together and afterwards separated by a fan or other winnowing machine.

STEAM BOILER.—Joseph Stevens, S. F. No. 294,927. Dated March 11, 1884. The improvement in steam boilers covered by this patent consists of a lower portion composed of alternate series of horizontal tubes crossing each other at right angles, their ends opening into vertical water-legs, which form the sides and inclose the grate and fire space, a combined steam and water drum situated above the tubes and circulating pipes, connecting this drum with the vertical water-legs at top and bottom.

APPARATUS FOR CURING TEA AND COATING COFFEE.—August Schilling, S. F. No. 295,290. Dated March 18, 1884. This invention is an apparatus for curing tea, glazing coffee and performing other functions of a similar nature, and it consists of a revolving cylinder, into which the substance to be treated is introduced, said cylinder being surrounded by a steam jacket, or other device for imparting the heat of steam to it.

New Incorporations.

The following company has been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

TUK SAN FRANCISCO AND WHITE RIVER M. CO., March 24th. Capital stock, \$1,000,000, in 100,000 shares. Directors, G. W. Brown, S. D. Simmons, W. A. Sublett, Martin White, and Martin Burdell.

SURPRISE CANYON M. AND M. CO., March 28. Certificate filed in Clerk's office of Inyo county. Capital stock \$1,000,000. Location, Panamint, Inyo county. Directors, C. H. Stanfield, A. Benham, S. B. Morey, J. H. Maloney and H. T. Holbrook.

UNION WATER M. AND M. CO., March 28. Object: Conducting and carrying on a general mining, milling, lumber and water business, to acquire, lease, operate and sell saw mills; to manufacture and sell all kinds of lumber; to sell water for domestic and agricultural purposes in and for the town of Murphy's Camp, Douglas Flat, Vallejo, Carson Hill, Angel's Camp and Altaville, in Calaveras county. Directors, J. W. Coleman, W. S. Wood, George L. Bradley, C. Rosner, G. D. Morse, Moses Hopkins, W. A. Keefer. Capital stock, \$15,000,000, in 150,000 shares.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time they intend to pay for it, let them not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Mining Share Market.

Inactivity still reigns in the stock market. What fluctuations have occurred have been very slight indeed. On the Comstock they have shown up nothing of importance although they continue to work away hopefully. All is now going on well in the middle mines, and active prospecting will be resumed in all as soon as connection is made between the west drift from the Combination shaft and the south drift from the Hale and Norcross on the 2800 level. All is going on well at the Gold Hill mines, and as there is a promise of an abundance of water in the Carson river, the indications are that these mines will do a profitable summer's work. The Ophir is yielding the usual amount of low grade ore from the 150 to 250 levels, while a good deal of prospecting is being done at greater depth. The Gould and Curry and Best and Belcher folks are steadily progressing, and as soon as they secure a good circulation of air will be in a position to do a large amount of prospecting. At the north end of the Utah folks are preparing to do some prospecting on the 1950 level, where there is still much unexplored ground.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Bullion Shipments.

Hanauer, March 26, \$2,050; Horn Silver, 26, \$6,000; Ontario, 26, \$3,850; Horn Silver, 28, \$6,000; Hanauer, 28, \$2,100; Crescent, 28, \$2,590; Horn Silver, 29, \$6,000; Ontario, 29, \$10,622; Vienna, 29, \$5,820; Ontario, April 1, \$10,989; Hanauer, 1, \$6,200; Crescent, 1, \$3,600.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. B. CROWELL—Merced and Stanislaus counties.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.

A. T. DEWEY. W. E. KWER. GEO. H. STRONG.

A Plain Book on Assaying.

"ASSAYING GOLD AND SILVER ORES"—By C. H. Aaron—is a new work published by Dewey & Co., which is intended by its author to be available for the use of miners, prospectors and others who only care to know how to assay gold and silver ores. The author of this work is well known in the mining regions of the Pacific coast as a practical metallurgist of many years experience. His writings for the press and his two previous works ("Testing and Working Silver Ores," and "Leaching Gold and Silver Ores") have shown his ability as a writer. The little book is plainly and simply written, more especially for the use of those persons not familiar with chemistry. No symbols are used, everything being plainly stated and clearly described. The scope of the book is shown in its table of contents as follows: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scoriafication; Capellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. These assaying tables give simple directions for figuring out results. This is the simplest, cheapest and most easily comprehended work on assaying yet published. The volume comprises 106 pages, with illustrations, and is well bound in cloth. The price is \$1, postpaid. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS office, San Francisco—1884.

SPECULATORS AND CAPITALISTS READ THIS!

I know where there are immense deposits of coal, worth millions of dollars. I need from twenty thousand to fifty thousand dollars, or more, to LOCATE, EXPLOR and IMPROVE said coal lands, much of which is upon Government land. Any person having the money mentioned to invest can make arrangements with the advertiser to go out with him and see with his own eyes the immense quantity and value of said coal lands. I am fully convinced that any party investing in said coal lands can, in less than two years, realize at least one hundred dollars for every dollar invested. Any person possessing the requisite means and "business," can address for two weeks, appointing time and place for interview.

A. B. "COAL."
Care of E. R. Robinson, P. O. Box 1474, San Francisco, Cal.
N. B.—The advertiser can show the very highest testimonials concerning integrity and business capacity.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rathford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Business Offices

Iron and Machine Works.

MACBETH'S
—PATENT—
STEEL PULLEY.

Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley. They are the only pulley of the kind which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited),
LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,

For the Mather Lane Spinning Co. (Limited),

TESTIMONIALS.

St. Louis, Mo., Sept. 28, 1883.
Messrs. Adolphus Meier & Co.—GENTLEMEN: We cheerfully certify that the "Heine Patent Safety Boiler" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,
ANHEUSER-BUSCH BREWING ASSN.

OFFICE OF Supt. OF ROYAL RAILWAYS,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 24, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished

with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over all other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrounding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,
Publishers.

SAN FRANCISCO, SATURDAY, APRIL 12, 1884.

VOLUME XLVIII
Number 15.

A Curious Rock Drill.

Wm. E. Peyton, of this city, has just secured a patent, through the MINING AND SCIENTIFIC PRESS Patent Agency, for a curious drilling machine. It consists of a drill holding a piston and spindle fitted in the bore of a barrel, and adapted to be driven forward to deliver its blows by an explosion in the barrel behind it, and to be returned by a spring. The object is to provide a drill of great power, capable of rapid and effective operation, and of such weight and cost as will adapt it for general use. The drill is to be mounted on a tripod or other ordinary support.

The drill-holding spindle is of such a length that its rear end, when fully in, extends back to the cartridge chamber, while its forward end projects beyond the end of the barrel a suitable distance. The spindle fits the bore of the barrel with sufficient exactness to secure and yield to the full effect of the explosion behind it, caused by the cartridge. The cartridge used may be made of shells filled with a small quantity of gun-cotton, nitro-glycerine, or any other suitable explosive, and may be of any required size or strength, the idea being, that a very small one, made at small cost, will answer the purpose. The explosion of the cartridge directly behind the end of the drill-holding spindle drives it forward to deliver the blow of its drill against the face of the rock. By reason of the spindle having to return to its place, being influenced thereto by its spring, some exhaust must be provided for the vapors and air. This is accomplished by tapping the bore at some point behind the limit of the forward movement of the rear end of the spindle, and running the exhaust passage in the most convenient direction. A cartridge tube automatically delivers the cartridge, and an ejector throws the empty shell through a discharge hole. The mechanism for feeding the cartridge to the chamber, exploding it and throwing out the shell is all automatic.

PATENTS.—The number of applications for patents is constantly on the increase. The issue for 1882 was 19,267; for 1883, 21,196. It is estimated that the number of issues this year will reach nearly, if not quite, 25,000. There seems to be no limit to human ingenuity. When the reader is reminded that over 5,000 patents have been taken out for washing machines alone, there will be no wonder at the multiplicity of devices for almost every conceivable work. Year by year the steps for developing the resources of the human mind, as shown in the Patent Office, seem to grow longer and larger.

COPPER CITY, Shasta county, Cal., is again deserted. This is the second time in twenty years that the place has been transformed from a thriving mining town to a deserted hamlet.

The Great Steel Canti-Lever Bridge.

The principle of the canti-lever plan is that of a trussed beam supported at or near its center, with the arms extending each way, and one end anchored or counter-weighted to provide for unequal loading, as is shown to some extent by the accompanying cut. In practice it is entirely new, this being the only bridge completed upon this principle. The Firth of Forth bridge in Scotland, and the Fraser river bridge on the Canadian Pacific, are now being built on this plan.

The total weight of the iron and steel entering into the composition of this massive structure is 3,000 tons. The bridge is of sufficient width for a double track, and is built to carry upon each track at the same time a freight train of the heaviest kind extending the entire length of the bridge, headed by two "consolidation" engines, and a side pressure of

tal uplifting force that can be exerted on each of the shore arms of the canti-lever is 340 tons, and the weight of each shore anchorage is 800 tons. It will be seen that every single piece of material is five times as strong as it actually need be, so that the bridge can be strained to only one-fifth of its ultimate strength. Each ingot of steel was submitted to a chemical analysis, and the samples to a mechanical test. The standard of excellence adopted was more severe and exacting than usual, and all steel that failed to meet the requirements was rejected. The contractors therefore say, "This bridge, in material and workmanship, has no equal."

The bridge was rigorously tested on the 20th of December, and under the tremendous weight of twenty locomotives and twenty-four heavily loaded gravel cars, showed a temporary deflection of but six inches. It is probably one of the strongest, as it is one of the most elegant,

THE STEEL CANTI-LEVER BRIDGE OVER THE NIAGARA RIVER.

thirty pounds per square foot, which pressure is produced by a wind having a velocity of seventy-five miles an hour. The total length of the bridge proper is 909 feet and 9 inches, divided into two canti-levers of 395 feet on the Canadian and 395 feet on the American side, supported on steel towers arising from the water's edge. A fixed span of 119 feet and 9 inches is suspended from and connects the river arms of canti-levers. The clear span across the river is 494 feet and 9 inches, being the longest bouble track truss span ever yet built. The bridge spans a chasm of 839 feet from bluff to bluff. The excavations were carried down until solid rock was reached, when blocks of "Beton Coignet" twenty feet wide and forty-five feet long and ten feet thick were put in. These formed one simple mass capable of withstanding a pressure almost equal to the best Quincy granite, and so distributed the load of 1,600 tons that comes upon each pair of steel columns as to produce a pressure of but twenty-five pounds per square inch on the natural formation. Upon these Beton blocks, four in number, was built masonry of the most substantial character, carried up fifty feet above the surface of the water. On these the steel towers rest, rising 130 feet and five inches above the masonry, and upon these are set steel super-structures. The total weight resting on each of the towers under a maximum condition of strain is in round numbers 3,200 tons. The to-

bridges in the world. Passenger trains now run solid over the Canti-lever Bridge, stopping long enough at Falls View Station to give passengers the very finest view of the falls obtainable from any point, and again at Niagara Falls, Ont., and Niagara Falls, N. Y., on their way to Buffalo.

MINING MAP OF INYO COUNTY.—J. N. Keeler has issued a mining map of Inyo county on a scale of twelve miles to the inch, giving all the mining districts and an explanation of the character of ores in the district. He also gives the location of the quartz mills, saw mills, arrastras, furnaces, etc. Printed with the map is a terse description of the resources of the county. The districts are defined by name and boundary line. It is to be regretted that similar maps do not exist of the other counties of the State. Mr. Keeler's idea is a hint to some of the more progressive residents of other counties who want to disseminate information concerning them. Inyo county has an area of 12,000 square miles, and has the credit of having produced at least two-thirds of the total silver product of the State. The map may be procured by addressing "Inyo County Map, 328 Montgomery Street, San Francisco." It is a small lithograph on thin paper and may be sent in a letter.

An international electrical exhibition is to be held in Philadelphia next fall.

Cable Railway Grips.

The Market Street Cable Company has brought suit against the Clay Street Hill Railway Company, and the Presidio and Ferry Railway Company, for infringement of patent on the grip now used by the last two mentioned companies, the Market street company owning the Eppelsheimer patent, which they claim is being infringed. The complaint states that Wm. Eppelsheimer, who was constructing engineer of the Clay Street Hill Cable Road, the first built in this city, was the original inventor of an improvement in that class of grips to be used on cable railroads, which has since become known as the "Hallidie Grip." That the same was a new and useful invention and consisted generally of combining four inclined carrying pulleys—which were designed for picking up and supporting and carrying the moving cable, while the car or dummy

to which the grip was attached was standing still with the jaws of the grip by means of two yielding bars. Each one of said respective rollers was forced to revolve upon one of four respective journals, one of which journals was fixed to each respective end of said two yielding pulley bars. One of said bars was respectively attached longitudinally to each jaw of the grip by means of two bolts, which passed from the jaw loosely through the longitudinal pulley bar. An annular India rubber yielding spring or cushion, made somewhat like a very large check washer, was then placed upon each

one of said bolts, and a large nut was then screwed upon each one of said bolts, so as to force the rubber springs against the longitudinal pulley bars, and hold them in position.

The bars held the pulleys a little in advance of the gripping dies, so that when the dies were loosened from the cable to let the car stand still the pulleys would be pressed forward by the bars and rubber springs with sufficient power to hold and carry the moving cable independently of the dies, and when it was desired to grip the cable for starting the car the rubber springs would yield enough to allow the jaws and dies to advance and grip the cable, while the pulleys and pulley bars remained substantially unchanged in their positions. Patent was issued to Wm. Eppelsheimer March 17, 1876, and his right was assigned recently to the Market Street Cable Co., of this city. The suit is in equity, and an injunction is asked for to prevent the use of the grip on the the Clay Street and Presidio roads.

A BOOM FOR INYO.—The indications are there will this summer be quite a mining boom down in the Inyo country. It is a region that promises well for both the man of small means and the capitalist. There will soon be mills and furnaces that will do custom work.

A large number of coal miners in Western Indiana have been on a strike for nearly two months.

The Leaching Process.

[CONTINUED FROM LAST WEEK.]

Pilot Charge No. 2.

Roasted in a five-hearth furnace.
1 P. M.—Entered fifth hearth; sulphur began to burn half an hour afterwards.

2 P. M.—Changed to fourth hearth; the hot pulp ran over the whole hearth like quicksilver.
3:30 P. M.—Changed to third hearth. The sulphur burned strongly, the arch becoming completely red. Very little wood was kept in the fireplace.

5 P. M.—Changed to second hearth. The charge did not swell; it ran before the rake, and great care had to be used to prevent its running out at the working-door.

6 P. M.—Added 8 per cent salt, well dried and finely sifted. The charge immediately began to swell and to give off copious torrents of gases.

8:30 P. M.—Entered first hearth, the charge still containing some sulphur. Hardly any wood was kept on the fire-bars. Still larger volumes of gases were evolved; the charge was much increased in bulk.

A sample was taken from the furnace, and a chlorine assay made in the usual way showed 76.2 chloridized, the two 300 grain samples giving buttons both weighing 0.118 grains.

The pulp itself only assayed 164 milles, having, in its passage through our fire-ovens, taken up a large amount of poor ores from corners, etc. Our furnaces were well scraped before introducing this ore, and a charge of tailings was put through ahead of it to clean off the floors and corners.

11:30 P. M.—A fresh sample taken; buttons from 300 grains weighed .026 and .024 grains = 96 per cent chloridized.

12:30 A. M.—Charge still contained a very little sulphur.

1:30 A. M.—Charge commenced to grow dark; the gas evolved smelt strongly of chlorine; no smell of sulphurous acid could be perceived.

2 A. M.—The charge was considered to be roasted dead, and was withdrawn.

The above chlorine assay proves that it might have been withdrawn two and one-half hours before it was.

The heap, after cooling naturally, was sprinkled, and two samples of 300 grains were taken twenty-four hours afterward, and gave .028 and .038 grains = 94.5 per cent chloridized.*

The roasted pulp was weighed: First weight, 1,704 pounds; second weight, 1,700 pounds; deducting 7.52 per cent moisture = about 1,570 pounds net.

The raw pulp having originally weighed 1,000 pounds, it took up from tailings, etc., from hot-toms and corners, during its passage in five hearths 9' x 9' each, 570 pounds.

This, of course, vitiates the result very considerably, but we were very loath to pass through the large parcel without having some insight into the working of the ore. Nothing analogous happened on working the large lot, because the first charge or two were the only ones affected.

A further chlorine assay of the roasted pulp was made, buttons from 300-grain samples, digested with hyposulphite, giving 0.028 grains and 0.030 grains = 94 per cent chloridized.

Experiments were made with a view to ascertain the loss occasioned by washing the roasted pulp with spring water. 100 grains were washed by decantation and filtration; the residue yielded by assay a button weighing 0.033 grains, the ore, before washing, containing 0.164 per cent.

Nothing analogous to this occurs on the large scale, because the brine is so rapidly diluted by the influx of large quantities of water. One quintal of roasted pulp from Pilot No. 2 was washed several hours in a small vat; assays of the ore after this wash gave 169 milles and 170 milles—the original unwashed ore assaying as before, 164 milles. There was, as before, some loss of silver in this operation, but the water removes the excess of common salt and certain soluble metallic salts—probably, in this case, mostly sulphate of iron—so that the washed residue was richer in silver than the original, its weight being less.

Two more samples from this roasted pulp were assayed, giving 166 and 158 milles.

The Main Lot.

The weights of raw pulp were as follows:

16,639 pounds was the weight of the main lot roasted.
100 pounds were sent to San Francisco.
1,000 pounds were taken by Pilot Charge No. 1.
200 pounds were added to roasted pulp of Pilot Charge No. 1, forming Pilot No. 1 b.
1,000 pounds were taken for Pilot Charge No. 2.
50 pounds taken for samples.
221 pounds of small rock, gravel, etc., which remained in the mortar-bed after finishing the stamping.
19,210 pounds.
720 pounds difference in weight.
* We use a wet mill, and in stamping dry, cannot prevent "slust loss."
Part of the loss is moisture expelled from the sheet-iron plates, and part was due to the fact that the ore was partially burnt on the plates.

20,000 pounds weight of ore.

Free sulphur was condensed on the upper strata of the ores lying on the sheet iron plates.

The pulp (main lot) was twice weighed, once on entering room for stamps—16,656 pounds—

* With this charge, as with its predecessors, no pains were taken to obtain it from all parts of the pile of raw pulp, as we were not then aware of the great differences of grade existing between the different classes stamped. The roasted pulp assayed by the crucible, 0.164 per cent and 0.163 per cent; by scorification, 0.138 per cent

once on leaving room for furnaces—16,622 pounds—average, 16,639.

The assays were as follows. Samples were taken after removing the two pilot lots and the sample for San Francisco:

364 milles = 106.2 ounces per ton of 2,000 pounds.			
370 "	107.7 "	"	"
375 "	108.4 "	"	"
378 "	110.2 "	"	"
377 "	110 "	"	"
374 "	109.1 "	"	"
376 "	109.7 "	"	"
376 "	109.7 "	"	"
380 "	110.8 "	"	"
381 "	111.1 "	"	"

Average, 375.5 milles (0.375 %) = 109.4 ounces per ton.
The silver contained is 16,640 pounds @ 0.375 per cent = 62,400 pounds avoirdupois.

Roasting of Main Lot.

Before charging any of this lot, four charges of tailings were sent ahead to clean off hearths, corners, etc.; since these tailings did not assay more than 0.005 per cent, any small residue of them remaining in the furnace may be regarded as neutral. The passage of these inert tailings left the furnaces cold, and the first ore charges worked very slowly.

The ore was roasted in a six-hearth reverberatory furnace, each hearth being 9 feet square. Each charge weighed 1,000 pounds. With a more intimate knowledge of the ore, very much larger charges can be used.

The salt used was eight per cent of the weight of the ore, i. e., 80 pounds to each charge.

6 P. M.—Entered sixth hearth.

7 P. M.—Changed to fifth hearth, a new charge entering the sixth.

8:30 P. M.—Changed to fourth, there being no signs of combustion of sulphur, although the second hearth was completely red.

9 P. M.—Second charge changed to fifth hearth.

9:15 P. M.—Third charge entered sixth hearth. Sulphur began to burn in first charge in fourth hearth.

10 P. M.—Changed first charge to third hearth; the hearth became red-hot through the energy of combustion of charge.

10:15 P. M.—Changed second charge to fourth hearth; its sulphur began to burn.

10:45 P. M.—Changed third charge to fifth hearth.

11 P. M.—Fourth charge entered sixth hearth.
11:30 P. M.—First charge entered second hearth.

11:45 P. M.—Second charge entered third hearth; it was red-hot.

12:30 A. M.—Added the salt to first charge.
1:30 A. M.—Changed it to first hearth; it still emitted sulphurous fumes.

2:30 A. M.—Added salt to second charge while yet in the third hearth. This was done to begin the chlorination in that hearth, so that less should remain to be done in the other two.

3 A. M.—Sulphur began to burn in the fifth hearth. There were signs of very active chloridizing in the first hearth.

5:30 A. M.—First charge was considered done, and withdrawn.

Sulphur began to burn in the sixth hearth; it will be observed that a cold furnace fifty-four feet long was very rapidly warmed up. This ore can be chlorine-roasted with a very small expenditure of fuel.

8 A. M.—Second charge was drawn. Another charge received its salt in the third hearth.

9 A. M.—The second, third, fourth and fifth hearths were completely red-hot, although very little wood was kept on the fire-bars; the fire-place measures only 4' 6" x 1' 10", the bridge being 1' 1" high.

The charge in the fire-hearth always appears dark in color, only glowing when moved with the rake. It speedily assumes the appearance of well-roasted ore, even when samples removed from it give off a strong odor of sulphurous acid; i. e., when it is known to contain intermixed raw sulphides.

11 A. M.—Charge No. 3 was drawn. After this the following charges continued to be drawn at intervals of from two to three hours; salt was invariably added in the third hearth.

In the night we saw plainly that the three hearths furthest from the fire-place were much hotter than the three nearest to it. This indicates the advantage of a continuous progressive furnace for this ore.

We can see no reason why this ore should not be roasted fast by people accustomed to it; the furnace might be as long as eighty feet. If a mechanical furnace be used, the ore could be advanced to the red-hot stage by the waste heat from it.

As soon as our own ores entered the furnace, after the last charge of these was done, the furnace rapidly began to cool.

The assays of roasted pulp were as follows:

323 milles = 94.2 troy ounces per ton of 2,000 pounds			
315 "	91.9 "	"	"
313 "	91.3 "	"	"
316 "	92.2 "	"	"
313 "	91.3 "	"	"
313 "	91.3 "	"	"
324 "	93.6 "	"	"
312 "	91.0 "	"	"
311 "	90.7 "	"	"
312 "	91.0 "	"	"

Average, 314.9 milles = 91.8 troy ounces per ton of 2,000 pounds.

The ore was twice weighed:

First weight,	17,454 pounds.
Second weight,	17,564 "

Mean, 17,519 "

As was done with the raw pulp, a small portion was taken with a U tool from each handbarrow on weighing; half the samples are from the first weighing, half from the second.

(CONTINUED NEXT WEEK.)

The Tribute and Contract Systems of Mining.

In speaking of the California group of mines in Colorado, the *Mining Gazette* says:

As the production of these mines is attracting universal notice just now, a summary of the yield and developments of the past months, and some comments on the methods which have accomplished these results, must prove of interest to all mining men.

From June 1st to December 31st the production of the California mine was 11,872 tons, worth \$136,839 58, or \$11 52 net per ton. The ore discovered and left as reserves was equal to that extracted.

The ground excavated during this period was 1,339.35 fathoms. This averaged seven tons to the fathom. The main shaft was sunk 81 feet.

For January of this year the output was 2,397 tons, returning \$26,213 81, the net profit being \$10,242 69. The yield for February and March has exceeded that of the preceding months, though the figures are not at hand.

The tribute system which is most adopted in the California and other mines under the same management, commends itself for several reasons. The lessees are required to work full shifts as men on day's pay, and are under the same supervision and restrictions. Their interest requires them to save all the ore possible, especially the smelting ore, which generally goes in part to waste under the other systems.

The following figures will illustrate how far more careful the tributers were of the smelting ore than the contractors during the six months above referred to, and that even the milling ore extracted was better assorted: In that period the contractors took out 9,161.12 tons milling ore, averaging \$8 49 per ton, and 238.22 tons of smelting ore, averaging \$88 50. Now note the proportion. The tributers extracted 2,277.68 tons milling ore, worth \$8 56 a ton, and 215.32 tons smelting ore, worth \$86 49 per ton. To show the advantages of saving the smelting ore, the following comparison is made:

One ton of smelting ore, say at \$84, is equal to sixteen tons of average grade milling ore, or ore yielding 4 ozs. bullion to the cord. Thus 16 tons, or two cords at 4 ozs. per cord equal 8 ozs. bullion, which at \$15 50 equal \$124,000. The cost of hauling to Black Hawk and milling in company's establishment at \$20 per cord is \$40, thus leaving \$84. That is to say an increase in the smelting ore output is a direct gain in every way.

Near Silver Plume the 7-30 mine is worked on the same plan and has of late made a larger profit to the owners than any mine in Clear Creek county. They started in with little or nothing, and now they are rich men. Neither the 7-30 nor the California group is especially rich, but practical methods have been adopted and the proceeds are not frittered away in extravagant salaries and unnecessary improvements. The success of such properties does immense good to the mining interests. Capitalists gain confidence. Managers, superintendents and foremen obtain credit, and feel pride in their work. Laborers are insured regular instead of spasmodic work. Though their profit for a time may be smaller, in the long run they are better off. Their interest becomes identical with that of their employees. To make a success of it, it must be conducted on business principles. The mining superintendent, foreman or director who squanders the money of his company carelessly, or for individual gain is as culpable as the bank cashier or clerk who misuses funds entrusted to the institution which he represents.

Besides the California mine, the Hidden Treasure, the Kansas and Kent Co., are under the management of the Rickard Bros., represented here by Mr. Alfred Rickard.

The Kansas has a shaft 1350 and the Kent Co. 1000 feet deep. They are both self-sustaining, being developed on their own resources. In this county the Kohinoor, the Donaldson and Champion mines, with their new mill, and in Leadville the LaPlata mine and smelter are under the same mining firm.

MANUFACTURING SODA.—The Candelaria

True Fissure says: W. D. Linton has just returned from a place near Double Springs, Schurz being the nearest railroad station, where he and a number of men have been employed for some time in excavating about fifty square feet of land, divided up into large square vats for evaporating purposes. The native soda, found in immense quantities near at hand, will be put into the form of a solution, and will then be run into these vats, where it will be acted upon by solar evaporation. After all the water is gone the soda is in quite a pure state. It is then removed and shipped away for the reduction of borax and other uses.

PRETTY ROUGH.—It is pretty rough on the hydraulic miners of California that they cannot work their mines this season, when there is a promise of a more abundant supply of water than for many years. To see all the water running by is enough to make the miners blow up the mountains with dynamite and send an avalanche of mud down upon the cow counties. —*Virginia Enterprise*.

A Wild Stampede.

The Excitement in the Cœur d'Alenes.

A gentleman just back from the gold fields of the Cœur d'Alenes says there are now about 4,000 men in the mines and they are pouring in in a perfect stream, not only by day time, but up to 12 and 1 o'clock at night. Many of them are so weak and tired on reaching the camp that they are barely able to walk. It will not be more than a few weeks until the population of the gulch will be fully twenty thousand.

It is the wildest stampede, he says, that he ever saw. This was especially the case at the time when he went into the camp. Many of the stampedeers were so anxious to get to the gulch that they would not take time to lay in a sufficient amount of grub to carry them over the trail, taking it for granted that plenty could be bought along the way. Thus it was that many were compelled to go all the way from Trout creek to the mines, a distance of about 35 miles, without a bite to eat and loaded down with their blankets and prospecting outfit. This was several weeks ago, but more recently lunch stations have been opened along the way.

The most interesting feature of the stampede at the time he went into the mines was the wild excitement which prevailed among the majority of the men. Many of them were of the pilgrim class, and couldn't tell a placer mine from a cabbage patch. Consequently they were easily imposed upon by the old-time stampedeers, who told them the most glowing tales in regard to the richness of the mines ahead of them. They were also informed that hundreds of men were pouring into the gulch daily, and that according to all reports the rich mines would soon be all taken. There was a perceptible quickening of speed on the part of the eastern element every time these or similar stories were circulated.

For the first third of the way from the railroad the pilgrims would pack their outfit intact. Then they would hear (and swallow) some of the exciting tales, and might be seen to secretly throw away a part of their load. By the time they reached the summit they would not have anything but their blankets and a little grub left. Then they would pull out for the gold fields with renewed vigor. But when they got half way down the slope the actual stampede would begin. Grub and blankets would be tossed to one side, and the hurrying throng would press onward like a lot of wild men, each striving to reach the golden goal first. Great must have been the disappointment on reaching Eagle City to find that no mining was being done, that none had been done since winter set in, and that the shining treasure, if it existed at all, was buried beneath deep banks of snow, which would not disappear until summer time.

This wild stampede left the trail in the condition in many respects of the line of retreat of a defeated army—blankets, provisions, tools, sleds and almost everything of a portable nature required in a new camp were strewn along hither and yon on both sides of the trail. The late comers, however, profited by it, and were enabled to fit themselves out with almost anything they wanted while going into the mines without the expense of buying or the labor of carrying.

Our informant is of the opinion that the mines will pay well, although it is impossible to tell much about them under present circumstances, for no actual mining is as yet in progress. But from the examinations which he made while in the camp he believes there is gold there and plenty of it. We hope so.

Money Spent on Harbors and Rivers.

A document just issued from the office of the Chief of the United States Engineers makes the following showing of the amount of money spent by the Government on rivers and harbors, beginning with the earliest appropriations:

States.	Net Expenditures.
Alabama.....	\$866,142.37
Arkansas.....	315,000.00
California.....	1,494,428.54
Connecticut.....	1,627,445.54
Delaware.....	3,043,626.20
Florida.....	600,352.84
Georgia.....	1,364,064.07
Idaho Territory.....	10,000.00
Illinois.....	2,252,304.50
Indiana.....	786,158.77

MECHANICAL PROGRESS.

Short and Long Boilers.

Short boilers are found to do more work, in proportion, than long ones. This has been confirmed by experiments on the rapidity of evaporation by Mr. Charles Wye Williams and others. Also short boilers strain less than long ones and are therefore less liable to need repair. A length of 30 feet should be the maximum, while with regard to the minimum some Lancashire boilers, to suit particular positions, have been made as short as 21 feet and found to work well, though the fittings become rather crowded. The length recommended and now generally adopted is 27 feet.

The diameter of the boiler is governed by the size of the furnaces, which should not be less than 2 feet 9 inches, to admit of a suitable thickness of fire, and afford convenience in stoking. Thick fires are more economical than thin ones.

The space between the two furnace tubes should not be less than 5 inches and that between the furnace tubes and side of the shell 4 inches in order to afford convenient space for cleaning and free circulation of the water as well as to give sufficient width of end plate for enabling it to yield to the expansion and contraction of the furnace tubes. With this width of water space it will be found that furnace tubes, having a diameter of 2 feet 9 inches, require a shell of 7 feet, which will afford a headway of about 2 feet 9 inches from the crown of the furnaces to the crown of the shell. A furnace 3 feet in diameter gives room for a better fire than one 2 feet 9 inches, but it requires a shell 7 feet 6 inches in diameter. For high pressure the smaller diameter of 7 feet is generally preferred, and has come to be adopted as a standard size for well boilers throughout Lancashire, though one of 7 feet 6 inches makes a good boiler and gives greater horse-power per foot of frontage than one of 7 feet diameter.—*Age of Steel*

UNIFORMITY OF SHOP HEAT.—Measurements of the metals in working, says the *Scientific American*, are reduced to such exactness that very slight changes of external condition affect their integrity. When a company that produces exact standards of measurement claims an accuracy of one-five-hundred-thousandths of an inch in linear measurement, and advertises to produce it, and another producer of tools of exactness insists on fitting work to one fifty thousandth of an inch, it may be considered that extraneous influences not formerly noticed may be sufficient to seriously affect these measurements. One of these influences is that of shop temperature. Exact measurements must be taken under certain conditions; when these conditions vary within limited periods, or while the job to which they pertain is in progress, there will be a difference that in some cases would be sufficient to impair the accuracy of the work. In one instance noted, a planer stood by the wall of the shop, the head upright close to a window. When the planer stopped on a winter night there was on its platen a lathe bed nearly finished, the V's lacked only the finishing chip. The tool carriage on the cross saddle had been left on the inner or shop side. In the morning, after a blustering, cold, windy night, the operator thought to test the theory of cold contraction, and he set the square-nose finishing tool to touch the top of the V on the shop side and ran it across to the wall side. The cutter scored across the cold side of the planer, plowing a groove of at least one thirty-second of an inch deep in the opposite V, a distance from the other V of but little over two feet.

A SHEET-METAL GAUGE ADOPTED IN ENGLAND.—A meeting of British iron manufacturers was held on February 28, at the Birmingham Exchange to take action respecting the gauge for the sale of hoops and sheets after March 1, when the new imperial wire gauge would come into operation. The question of the best gauge for adoption gave rise to considerable discussion. The Whitworth gauge, which some wanted, was objected to on the ground that much trouble would be experienced in dealing with foreign buyers, who had adapted all their transactions to the old wire gauge. Others suggested a modified Birmingham gauge, but the final decision of the meeting was expressed in the following motion, which was carried unanimously: "That this meeting confirms the resolution passed at the meeting held on December 6, viz.: 'That this meeting adopts the gauge known as the Birmingham gauge,' and further resolve, that such Birmingham gauge shall be the proposed standard gauge for sheet and hoop iron already printed and issued by the South Staffordshire Ironmasters' Association to the manufactured iron trade, and by them approved and also deposited with the Board of Trade, and that such gauge shall in future be used under the initial letters 'B. G.'"

AN INQUIRY INTO THE ORIGIN OF INVENTION.—In an interesting paper read before the Anthropological Society of Washington, Mr. Franklin A. Seelye gave the results of an investigation, the object of which, he stated, was to consider the nature of the first steps in mechanical invention, far back of history, of tradition, and of revelations of archaeological research. He showed by several examples that every invention, however complicated, was the end of a process of evolution starting from the

most primitive beginning. He traced thus the evolution of the modern steam engine as well as the bow and arrow of the savage; they could all be traced back to rude types in a few mechanical expedients which man possessed at his earliest origin, and employed, guided by his own selection, and which have been supplemented by other expedients from time to time discovered or invented. He then asks the question, "What were the expedients of primitive man?" and replies that the mechanical expedients possessed by the earliest human beings were such, and such only, as they possessed in common with the brutes. The expedients of the latter were then described by the author, who finally led up to the argument that nothing less than man with his reasoning powers could have made improvements upon them. Incidentally he remarked that the finished product always precedes the machine or invention which produces it, and no art is known to us that has not grown up from simpler and ruder arts.

FINISHING BY PRESSURE.—Articles of wrought iron and steel, as parts of machines, guns and small tools are largely made by the process of drop forging. Thus shaped in dies they require only surface in finishing, as their forms are secure and nearly perfect. Many of these articles require, however, the milling machine or hand filing to dress them previous to polishing. This work can be saved in many instances by compression finishing. Sewing-machine shuttles and small gun parts, pistol frames, fork wrenches, and many other small pieces, are subjected to pressure while cold, with the result of producing a very clean and even surface. Under a pressure of 800 tons a small piece, like the hammer of a percussion lock gun, comes out of the compression dies as clean and smooth as the faces of the dies themselves will permit. In fact, the process is exactly like that of minting gold, silver, nickel and copper blanks. The cold metal is compelled to flow and fill the dies. Under such a pressure drop forged Norway iron, after it has been subjected to the tremendous impact of the drop forging hammer, will yield to a permanent compression of one four-hundredths of an inch.—*Sci. Am.*

A LONG STRAIGHT EDGE.—An absolutely exact straight edge of more than 36 inches is a wonder of mechanism. One of 6 feet was not recently believed possible, although several had been made on different plans of web-like and truss construction. It has been claimed, however, that almost absolute exactness has been secured by a straight edge 12 feet long. The appliance looks like an arched truss, the highest spring of the arch being only 20 inches in a length of 12 feet. The space between the chord and the spring is filled with diagonal lattice work; the whole is a casing on which no opening with the hammer is allowed. Three of these straight edges have been made, one remaining in the establishment where built and two going to technical colleges. Each of them has been tested by each other, and proved to be practically perfect. Such a tool is invaluable in testing lathe and planer beds.—*Sci. Am.*

ASBESTOS ROPE.—The manufacture of rope from asbestos is likely to become an industry of considerable importance in England, the strength of the article being estimated at about one-fourth that of ordinary hemp rope of the same diameter. Rope of this material of one and one-half inches in diameter is stated to have a breaking strength of one ton, and twenty feet of it are calculated to represent a weight of thirteen and one-fourth pounds. Some of the purposes, as enumerated, to which this kind of rope is especially adapted are theaters, fire brigades, and means of escape from dwellings and public buildings, its advantage being that it will not break and drop its burden if the flame burns upon it. It is made like ordinary rope, and is spun from Italian asbestos thread.

A MAMMOTH CHAIN.—Two heavy chains of the following dimensions, for use on the large floating bridge connecting Portsmouth and Gosport have recently been made in England. Each chain was 640 yards in length, consisting of nearly 5,000 links, the diameter of iron being 11-16 inches, and the weight of each chain 21 tons, tested to a tensile strain of 40 tons, or 20 per cent, over Admiralty test, the actual breaking strain being proved to be 70½ tons. Each chain was loaded upon a carriage weighing 11 tons, the load for road transit being 32 tons.

BRICK VS. IRON.—An architect of New York, speaking of building material, says: "Under the rational order of things, brick will survive centuries without showing its age, but an iron structure under the best care will begin to show the weight of years by the close of the first century."

FLY WHEELS LOADED WITH LEAD.—Small fly wheels, cast hollow and loaded with lead, is a foreign notion that promises to become popular in this country. They afford the same centrifugal power as the large wheel, cost less and take up less room.

GOOD IRON, whatever be its name, should possess the following qualities of its minimum degree, viz.: Tensile strength, 40,000 pounds per square inch; contractility, 15 per cent., and elastic resistance of not less than 25,000 pounds per square inch, the last the most important.

SCIENTIFIC PROGRESS.

The Winds and the Waves.

One of the first things to be observed in a storm is the way the wind acts. It does not blow regularly, but in gusts. At one moment it bends over the branches of the trees; in the next it has loosened its hold and let them fly back. We see it swelling out a ship's sails into a puff; a minute later the sails hang, flapping as if they had been struck down.

We can account for these phenomena and explain the intermittence of the wind pulls by assuming that the molecules of air, displacing each other, excite a vibratory motion which gives rise to little undulations following one after another at intervals of a few seconds. The resultant of a series of these undulations is a puff of wind which comes on suddenly and is followed by a short lull. A series of pulls constitutes a squall, and an aggregation of squalls forms the atmospheric wave which is called a gale of wind. We should naturally expect to observe the same phases in the formation of sea waves; and, in fact, if we carefully examine a wave, we shall find that it is covered with very fine ripples that correspond to the atmospheric vibrations. The ripples give rise to wavelets, which correspond to the undulations of the air, and are seen on the upper part of the waves. A number of waves constitute a billow; a series of billows give rise to a heavy sea; a series of heavy seas produces the great swell or tidal wave of the storm.

From the nautical point of view the ripples are of no importance, for they are seldom more than a few millimeters in diameter; but from the scientific point of view they may be considered as the origin of the swing of the liquid element, for they engender the wavelets. The last are still of no interest to the sailor, but are important in their relation to works of art, which are disintegrated by their blows apparently insignificant, but infinitely multiplied. The wavelets are from ten to thirty centimeters in diameter, and not very long. A very heavy wind breaks them up and contributes to the formation of a fine dust of salt water or salt spray, which is destructive to vegetation on exposed coasts. The wave proper may, in the English channel, be about ten feet high, thirty feet or more broad, and eighty feet long; its proportions do not disturb large ships, but it is destructive, in the long run, to port-works, and is dangerous to small craft when it breaks. We may estimate that ten waves make a billow. The first of the ten may be relatively small, but the others go on increasing to the last.—*Popular Science Monthly.*

Animal Remains in Coal.

Professor Miall, F. G. S., in a lecture on "Animals of the Coal Period," recently delivered at York, said that there were to be found associated with seams of coal, and especially with beds of shale even below coal seams, the flattened impressions of various creatures which once had life. There had been seen shells and other fossils, and the squeezed impressions of the bodies of crustaceans or insects. These remains, were, however, extremely fragmentary, and were as black as the shale in which they were imbedded; it was, therefore, a matter of considerable difficulty to put them together in order to find out their original shape or to what sort of animal they belonged. But during the last 100 years a number of naturalists had engaged themselves in this task and had brought to light a variety of results. Naturalists, indeed, believed that our common pond mussel was represented by an ally in that very remote period. It was found that the fresh-water animals of the coal period were very much more like recent animals than were the marine forms of the earlier times like those of the present day. Many of the common shells of Europe were represented in extremely remote antiquity. But marine shells and other productions of the sea were not mixed up with the beds, in which had been discovered land shells and the remains of land animals. All the marine productions kept, as it were, to themselves, and they were found in special beds or layers; but the marine beds seemed to mark the time when some low barrier which kept the sea at a distance was suddenly broken down, and the water of the ocean made an incursion upon either a fresh-water area or a land area, and left behind it some marine shells. Fossil centipedes, such as might now commonly be seen in our gardens and fields, had been discovered in coal measures. Scorpions, too, had been traced by their fossil remains, and thus proved to be closely akin to the scorpion of our own day. Cockroaches resembling in all essential features those with which most of us are familiar had been discovered in considerable numbers, and those of the present time formed perhaps one of the most ancient types of animal life now to be found upon our planet. Then there came the crayfish, which could be tolerably matched nowadays. But there had been animals which had disappeared from the earth altogether, without having left behind them any animal very similar to themselves.

PERMANENCE OF THE SEA LEVEL QUESTIONED.—In a paper in the bulletin of the Moscow Society of Naturalists, upon periodic oceanic oscillations, Trautschold attacks the problem of oceanic alterations of level and their relations to geological phenomena. His conclusions, based

upon a careful study of the past and present physiography of eastern and central Europe and western Asia, are to the effect that many of the phenomena of sedimentation and deposition attributed by geologists to a subsidence of the crust, are, in fact, due to periodic oscillations or upheavals of the oceanic surface, producing thereby inundations of the land masses, and that such is the nature of much of the newer sedimentations, *c. g.*, Jurassic of Russia. The position here maintained—a revival of the views of many of the older geologists, is anticipated by Prof. Edward Suess, who, in his "Antlitz der Erde" (Prague, 1883), clearly indicates the necessity of invoking the assistance of periodic oceanic fluctuations of level to account for the existence of much that has been heretofore attributed to terrestrial subsidence.

STONES PLACED IN PINE TREES BY BIRDS.—C. R. Oratt, of San Diego, contributes a note to science, as follows: About 65 miles south of the United States boundary, near San Diego, at an elevation of 6,000 feet, is a stretch of table-lands covered with large pines (*Pinus jeffreyi*), broken by many ridges of giant granite boulders, decomposing sufficiently to add materially to the soil. Broad, grassy meadows furnish food for cattle and deer. My father and myself, in riding through this forest in July, 1883, noticed several pines with the bark bored into at varying distances from the base of the tree to the branches; and in about one-third of the holes were the acorns of the here common *Quercus Emoryi*, very tightly fitted, the holes containing the acorns apparently newly made. The remaining holes were weather-beaten; and in them were equally tightly fitted bits of the granite gravel, of size corresponding with the acorns in the other holes. In the Guaymas mountains, of this county, a gentleman observed *Colaptes auratus* visit pines that contained similarly disposed acorns. The woodpecker tapped the acorns, breaking one now and then; the broken shells showing plain traces of having contained a worm, while the other acorns contained sound kernels. But what object could the birds have in substituting stones as shown above? Possibly they served as hiding places for many insects which would otherwise have secured places inaccessible to the birds.

ELECTRICITY IN RAILWAY RAILS.—A French journal gives an account of some curious experiments which were recently made in connection with the rails of the railway between Marseilles and Cognac, France, by a professor in the Faculty of Sciences in Marseilles. All the rails laid down for some time past have been transformed at both ends into powerful magnets capable of attracting even large pieces of iron. It was found that if the rails are removed they still retain their magnetic force for some time, losing it gradually. The magnetism is noticeable only after the fish plates are removed, and is accounted for by the friction produced by the wheels running over the line. On the whole, it is considered that the magnetic force exercises a beneficial influence by increasing the adhesion of the wheels to the rails.

THE COLOR OF INSECTS.—The relation of light to color in the evolution of species of insects has been discussed by G. Lewis, who is disposed to attribute the origin of the colors of insects to the sun's rays rather than to sexual selection. He supposes a process by which the various rays or wave movements from the sun impress living organisms with the structure necessary for color, and terms it "photoplasticity," basing his supposition on the alleged sufficiency of this mechanical theory of the action of light to explain the phenomena of color. After giving many instances from the Insecta, of protective coloration, he speaks of Lamarck, where the coloration is not protective, and states his belief that the latter are due to the sun's action.

EXPERIMENTAL AGRICULTURE IN CANADA.—The demands of progressive agriculture for a more substantial scientific basis are just now beginning to find definite expression in the Dominion of Canada. From the recent examination of experts before a special House committee at Ottawa, and from the general expressions of those who have a direct interest in the question, it is apparent that a keen sense of the utility of experiment stations is now developing a movement, which, it is to be hoped, will secure for the Dominion one or more much needed stations, founded upon the European idea of their utility from a scientific standpoint, and from that of the practical application of acquired results.

LIGHTING THE INTERIOR OF STEAM BOILERS.—A firm of boiler makers in England have arranged an electric light apparatus for lighting up the interior of steam boilers while they are under steam. It is said to work successfully, and there seems to be no good reason why such an apparatus would not be very useful. Certainly, valuable information regarding the influence of different methods of construction upon the very important subject of circulation might be obtained in this manner, which can not be had in any other way.

EXPLOSIVES.—The power developed by the explosion of a ton of dynamite is equal to 45,675 tons raised one foot, or 45,675 foot-tons. One ton of nitro-glycerine similarly exploded will exert a power of 65,452 foot-tons, and one ton of blasting gelatine similarly exploded, 71,050 foot-tons.

Passing Events.

Mining news generally is without special interest just now. In this State the most active center is among the quartz miners in Nevada county, and in Sierra county. From Nevada little encouraging news is at hand. A great many miners are leaving the camps and towns for the Northern mines. There is scarcely a district that will not furnish its quota of those joining in the great rush. The transportation companies will reap a rich harvest no doubt. We give, in other columns, the latest news from the new mines. Another new placer region outside of the Cœur d'Alene is also announced, as will be seen by our mining summary.

Heavy rains during the week have caused inconvenience on our Southern California railroads, but it is not likely that the rainfall will keep on much longer, as we are rapidly approaching our dry season.

THE New York correspondent of the *Troy Times* says that one of the curious features in domestic architecture is the transportation of stone from that city to San Francisco for the palace which James C. Flood is constructing. This stone is quarried in Connecticut, and is then sent to Newark, where it is dressed, after which it is brought to New York and reshipped for its final destination. The ship *Alfred Watts* is now receiving 2,000 tons of this dressed stone, and other shipments will probably be required.

Traps for Inventors.

As soon as the United States Government grants an inventor a patent, and the Official Gazette of the Patent Office announces the fact, that inventor receives an alarming addition to his mail every day for a week. Advertisements, circulars and letters come to him from patent agents, patent vendors, patent institutes, humbugs, and all sorts of companies, firms and individuals. All of these letters and circulars express a warm interest in the invention in question, and a desire to benefit the inventor. They are all philanthropic in tone, and suppress any indication of desire for gain. It is for the inventor's good only that they write.

On closer investigation, it is found, however, that every one of these disinterested individuals needs some pecuniary acknowledgment before any business can be done with them. One man wants a \$5 or \$10 fee for advising the inventor what to do; another wants money to print circulars of the invention; another wants to exhibit the model in a room with other models, or wants to make a model; others want to negotiate for territory or sell rights, and so on. But every one needs more or less money in hand to do these things. The inventor who gets his first patent is dazed at all these offers, and sees so many tempting methods employed to make money that he is often deluded into parting with his coin without any very definite understanding of what he is to get in return.

All sorts of traps are set for unwary inventors. There is a class of men who prey on them. Inventors, as a class, are enthusiastic and sanguine. They believe their devices are of the greatest benefit and highest importance. Men who acknowledge and recognize this, and who praise their inventive genius, are apt to gain their confidence, and too often this confidence is abused.

Any respectable and reputable patent soliciting firm will advise its clients to be exceedingly careful of the persons with whom they transact business in patents or patent articles. There are so many frauds that it is difficult to segregate them from people in legitimate business.

There are all sorts of ways of getting money out of inventors. The latest which has come under our notice is the formation of a secret society, to be composed solely of inventors. There are not to be more than 250 members of the order. The initiation fee is to be \$25, and the monthly dues \$5. Members of such are to be assisted, and if they die their widows are to be supported. All this with 250 members, and \$5 per month. Some of the provisions are amusing. All new devices are to be submitted to a committee, which is to point out defects and indicate the cure. The order then sits as a body of examiners-in-chief, and passes on the merits of the invention.

It is not stated how a windmill man becomes an expert in steam engines, or a washing machine inventor is able to judge of the merits of harvesting machinery; but it is provided that the order will take out the patent through some special agency, probably to be indicated by the President, if he should happen to be connected with one, as will probably be the case. The patentee is then to assign a quarter interest to the society. There is to be a library, museum, etc.

The milk in the whole cocoanut, however, is to be found in this provision: “It is provided, in case an inventor is not able to join the order, and maintain his standing therein, he may, on the payment of a fee of \$15, place his invention in the hands of a member of the order, acting as his attorney, and who will be allowed to bring it before the order, when it will be subjected to the same ordeal as the invention of members, etc.” With this provision a dozen or two men may run such an “order” with great facility.

It is not at all probable that such a scheme will attract many inventors, but it is possible some may be thoughtless enough to lend their names without due consideration. No man should assign any interest in his patent to unknown parties and without some distinct understanding about it. He should not accept the weak statement of interested parties without thoroughly investigating their antecedents and business standing. And before he pays out any money, let him find out who his associates are to be and how many of them there are. Elevation and advancement of inventors is all very well, but as a general proposition they can advance themselves better than other people can do it. No man should go blindfold and thoughtless into any scheme of a doubtful utility on the mere representation of men he does not know. It is pretty well understood that it takes personal efforts of a very energetic character to sell patent rights, and the mere exhibitions of models and drawings or assignments to agents does not always accomplish the object.

Foundry Notes.

The Risdon Iron Works

While the Risdon Iron Works has on hand no very large contracts, there is considerable work in the shops. Among other things they have in course of construction six of the Heine boilers, a type which they are introducing here very rapidly. Among them in one for the Parson's Flour Mills, one for the Capital Flour Mills, Los Angeles, and one for the Stockton Water Works. They are making also a compound condensing engine for a new stern-wheel steamer for the Spreckels sugar refinery. The boat has just been completed at Turner's ship yard, Benicia. She is intended for carrying sugar, and will run from the refinery, at South San Francisco, to the city front wharves.

Among the specialties now being introduced by the Risdon works is the Coleman compound engine, of which several are now in course of construction. One of these is going to a saw mill. There are two for flour mills, one going to the Capitol mills, Los Angeles, and the other for Parsons. There is also a compound mill engine for the Tajo mine, Mexico, and a compound pumping engine for the Stockton water works.

Two large steel boilers for the steamer *Ancon* are nearly completed. They have three furnaces. They will be put in with fore and aft supports, and not as usually arranged. It is thought that in this way the weight will be more equally distributed and the bottom of the boiler will be more accessible.

They are sending a large ice-machine to Sydney. It is a 40-ton machine for the Beath process. An English gentleman who had investigated ice machines in many parts of the world examined the one of the style at work in this city and ordered the machine now being made. The works are also putting one of the Bell-Coleman refrigerators into one of our Pacific coast ocean steamers. It is intended to preserve milk, provisions, meats, etc., and no live stock will have to be carried on deck. It will be possible also to carry on this vessel in the refrigerators, game, meat, fish, etc., for sale in the markets at her destination. The whole apparatus is being put into the steamer on contract.

At these works they have just fitted up a special shop with suitable tools for manufacturing the McBeth pulley, which we recently illustrated in the MINING AND SCIENTIFIC PRESS. They are now being made in quantities and furnished to the trade. A 42-inch pulley of this make is now driving the machine shop at the works. The pulley it displaced weighed over twice as much as the new one.

Among other things being made in the shop is a charcoal grinder for the Giant Powder Company. There is also a large double-effect sugar machine for the Sandwich Islands. They are at work on some very heavy water pipe, made of one-fourth inch wrought iron, for the Spring Valley Water Company.

Among other things of special interest may be mentioned the machinery now being made for propelling cars by compressed air. The air compressor and reservoir are completed, and a trial will shortly be made on the Howard street line. By the system proposed the cars will take in a fresh supply of compressed air at every stoppage for passengers, pipes running the whole length of the line for conveying the air from the reservoirs.

The Risdon Works are sole agents on this coast for the Wilson Gas producer. It may be applied to factories or other places where fuel is burnt for raising steam or other purposes.

Technical Society of the Pacific Coast.

An adjourned meeting of this new Society was held in the Patent rooms of the Mechanics' Institute, on Saturday evening last, Mr. George I. Specht in the chair. The report of the committee on revision of the constitution was read by Major Jones. An entirely revised constitution was submitted, the amendments and changes decided on at the previous meeting having been incorporated therein. After some slight discussion the constitution, as read, was adopted. An agreement to organize was signed by those present desiring to become charter members, and it was left open for signatures until Saturday, the 12th inst, at 8 p. m.

Mr. Manson thought that instead of electing officers a nominating committee should first be

appointed. The idea did not prevail however.

A motion was carried to appoint a committee of five to draw up suitable by-laws and present them at the next meeting. The chairman appointed Messrs. Parry, Gutzkow, Molera, Bridges and Wagoner.

There was an attendance of upwards of 70 gentlemen at the meeting, and great interest was manifested. Already 95 charter members have been enrolled. This Saturday evening, after the adoption of the by-laws, the officers for the ensuing year will probably be elected. The new society will start under very favorable auspices indeed.

Prizes for Mining Essays.

Among the methods adopted in European countries for the dissemination of information about mines, and the encouragement of students of mining, is that of offering prizes for essays on subjects connected with the industry. Sometimes the prizes are offered by technical institutes or mining institutes, and sometimes by individuals. This is an idea worthy of imitation in this country. It would be greatly to the advantage of the mining population if any corporate body, association of individuals, should offer substantial sums for essays on practical matters of mining. An example in point is that of a gentleman in England, who offered three prizes for essays on the following subject: “Practical suggestions for guarding against such accidents as are still commonly met with in coal mines especially with reference to the part that workmen and officials may themselves take in guarding against such.” Sixty persons intimated their intention of competing, and thirty of these sent in their essays.

The competition was open to any one working in or about coal mines in the county of Durham, within the South Durham mines inspection district, not above the grade of an overman, and who has not served an apprenticeship with a mining engineer, and who, having been for three years or more employed underground, has also been, for at least three months, a member of a colliery institute or of a science class, or other like institution. Two months' time was given to prepare the essays. In a separate sealed envelope was given the real name of the writer of the essay, his occupation, name of colliery, name of institute of which he was a member, etc. The sealed envelope was not opened until after the examiners had given their decisions on the papers, which were, by the way, signed with *noms de plume*. The length of the essay was not to exceed six pages of foolscap, written on one side, and to be the honest production of the writers.

The information gained in this way is of a very practical character, being the results of the every-day experience of practical men.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening. Dr. H. W. Harkness, Vice-President, presiding. The name of Edward Probert, M. A., a graduate of Cambridge, was proposed for membership. The librarian announced several valuable contributions.

Rev. E. S. Greene gave an account of a trip which he recently made in San Luis Obispo and Monterey counties. He found at Paso de Robles a comparatively new botanical territory. During the trip he discovered three new species of flora. In the middle of San Luis Obispo county he discovered a new species of gooseberry, wholly new to science. Near Soledad he came upon a new species of olive tree peculiar to California. These results indicated how much of our botanic wealth was yet to be learned.

The Chairman stated that he had received from J. M. Hutchins specimens of oak galls from the Yosemite Valley, exhibiting the work of the insect, which is one of the *cynips*.

A letter was read from William Carter, of North Vallejo, who lost last year seventy-five acres of barley by the ravages of the Hessian fly, and would probably lose 500 acres of wheat this year in the same way. Accompanying the letter were several specimens of the egg, grub, and pupa, taken from his wheat field. The eggs were one-fifteenth of an inch in length, and one two-hundredth of an inch in breadth. They would probably hatch out in a few days. Dr. Harkness had some of the specimens prepared for exhibition under the microscope.

Dakota Territory.

Placer and Quartz Mining Districts of Pennington County.

Pennington county lies in the southwestern portion of Dakota Territory, and is bounded on the south by Custer county, east by the South Fork of the Cheyenne river, north by Lawrence county, and west by Wyoming Territory. The principal creeks flowing into the Cheyenne are the Rapid, Spring and Battle creeks.

The western half of the county is mountainous and rough, but rich in precious and other minerals. Some of the most valuable placer mines of Dakota are situated along the foothills of the belt. The ore is low grade, but free milling and abundant, and the facility and cheapness of its extraction and treatment render these mines valuable and guarantee a prosperous future for this district, the country being well watered and timbered. W. H. N. Maguire, editor of the *Pick and PLOW*, of Rapid City, gives the following description: "The last year there were probably 200 miners engaged in placer mining, in the summer months—working under great disadvantages—and the average per capita could not have been less than \$750, making the total yield \$150,000. But it must be borne in mind that all this mining work was of the most primitive kind—wheeling gravel a long distance from the higher bars to the creeks to wash. For this reason no adequate idea of the extent and richness of the placer deposits of the Black Hills can be formed from what they have actually yielded to date. The deposits are of immense extent, embracing many thousands of acres, the gravel in places being over fifty feet in depth, carrying some gold from the top down. It is believed a thousand miners will be employed for many years working the placers of Rapid and Castle creeks, beginning with the completion of the flumes and ditches that will bring water over all the bars at a sufficient elevation for hydraulic mining. Aside from the vast bars of auriferous gravel lying immediately along the banks of Rapid and Castle creeks, embracing many thousands of acres, the 'Red Bed' or foothill placers embrace a 'wash' extending in a northerly and southerly direction from Elk creek to Spring creek, a distance of from 15 to 18 miles, and having an average width of 2 miles. Good gold prospects are found at all points in this immense belt of washed gravel; the poorest would rank with the best present hydraulic diggings in California, and good 'dumps' abound. All this ground will eventually be covered by the Upper Rapid Creek water rights of the Estrella Del Norte Mining Company."

Rapid creek (the Castle, its principal tributary, being the main and central current of the Black Hills) is the only source of supply for water for the placers of Pennington county; but its volume is never less than 3,000 miners' inches in the driest season. Every inch of it, from the head of the Castle to the debouchure of the main current from the eastern foothills, has been appropriated, and within the next three years will be actually utilized by the Estrella del Norte Company—one of the strongest organizations of Eastern mining capitalists—when the gold yield of the Black Hills will be immensely increased, and American placer gold mining will probably assume something like the importance it held in former years. There are in Pennington county many very promising gold veins, some of vast extent, but they have not yet been developed to a produc-

ing condition. The gold yield from them will undoubtedly be very great in the near future. Responsible companies have been organized for the development of some of these veins. At the head of Castle creek, in Pennington county, are found vast bodies of copper ores, the result of 44 assays of ore from the Wall Street and Equator mines showing an average of 31.7 per cent copper. These ores are generally in carbonates, and smelt very readily without the introduction of foreign fluxing material.

Rockerville Placer Mining District

Is situated 15 miles southwest from Rapid City, in Pennington county. It is on the eastern edge of the slate formation, and adjoining the limestone which encircles the hills. Some of the gulches have cut through the limestone and worked into that formation. It is on high table-land, lying about 200 feet higher than Spring creek, which runs through a deep canyon about a mile north. Mr. Fred J. Cross says of this district: "There is no stream of water running through the district, though there are a few small springs on Rocker gulch, which, by damming, furnishes a little water, and in wet seasons, with the surface water, will furnish sufficient for sluicing part of the time. The water for working to any extent has to be brought by ditches and flumes. The past sea-

Mitchell bar, where it was used quite successfully the past season for hydraulic purposes, and washed off a large part of this bar. They also extended their bedrock flume for quite a distance below Harney, and constructed two miles of flume to be used for hydraulic work in connection with the bedrock flume. These flumes were little used during the past season, as the company directed their attention to the work on and above Mitchell bar. After the close of the placer working season, quite extensive prospecting work was started in the bed of Battle creek, between Mitchell bar and Harney. A shaft was sunk, and bedrock struck at depth of 30 feet. From the bottom of the shaft drifts were opened both ways, crossing the bed, one of which penetrated about 15 feet, the other not so far, getting fair prospects. Cold weather coming on, work was suspended for the winter. Water was encountered in the gravel and on the bedrock, and necessitated the use of large steam pumps, delaying the work as well as making it quite expensive. On completion of the prospect, it is announced that the company, if they find pay sufficient to warrant it, will put in a bedrock drain or complete their bedrock flumes. For the first time bedrock has been touched on the creek, in the upper part of the district.

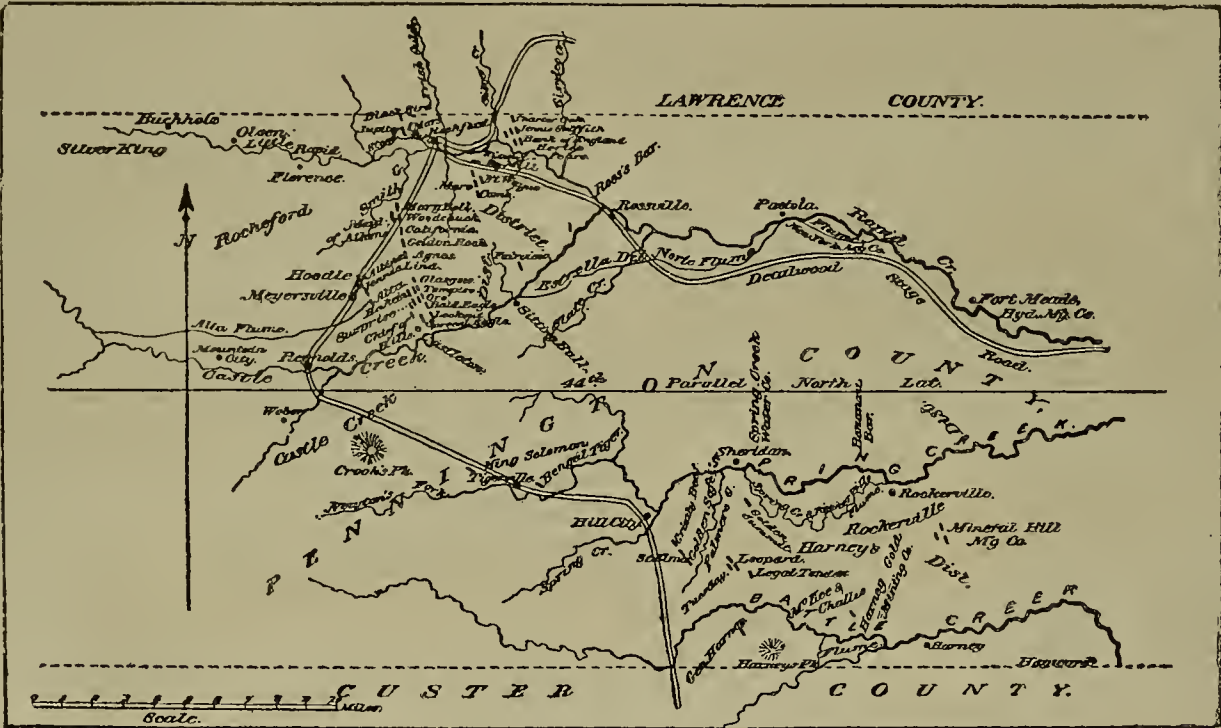

In the Cross Quartz Mining District,

Atmospheric Pressure and Underground Work.

The influence of sudden variation of atmospheric pressure or outbursts of fire damp in coal mines, is a subject which has been discussed without any very definite result being arrived at. The majority however, seem to think that this influence is great; and in England, regulations have been made to protect the underground workers in fiery mines from the evil consequences of this capricious influence, and governmental authority compels observance of the rules. During a heavy fall of the barometer, ventilation is quickened, and some persons advise a stoppage of blasting at such times. Experiments made a few months ago by a Belgian engineer showed that an effect of high winds was to diminish the action of fans in a very appreciable degree. Since these winds occur with a low barometer, the ventilation of the underground workings may be lessened at a time when it should be augmented; or a slightly increased velocity of the fan intended to give the requisite augmentation may be neutralized by the action of the wind. This is a fact demanding careful attention, and deserves to be generally known.

An arrangement of barometers and fans at a

Belgian colliery, where they believe there is danger at periods of low barometer, has been noted by Mr. Andre, the well known mining engineer. The ventilation is there effected by means of a large Guibal fan driven by a horizontal engine, the cut-off in which is controlled by a mercury barometrical regulator. With this arrangement a decrease of the atmospheric pressure—in other words a fall of the barometer—automatically increases the admission of steam to the cylinders; while an increase of pressure, indicated by a rise of the barometer, diminishes the inlet in a corresponding degree. Warning of the change

PLACER AND QUARTZ MINING DISTRICTS OF PENNINGTON COUNTY, DAKOTA.

son was very favorable for mining. There was water enough, and in some places miners were driven out of deep diggings by it. The Black Hills Gold Placer Mining Company completed, in 1881, a good, substantial flume, about 16 miles in length, which takes the water out of Spring creek and conveys it into the district at a height sufficient to allow it to be distributed to all parts, no gulch or bar lying so high but that the water from this flume can be carried to it. In 1881 a company was formed, called the Rockerville Bedrock Flume Company, which secured the right of way through all claims on Rocker gulch for the construction of their flume, and secured also some good claims on the gulch. But little attention is paid to quartz mining in Rockerville district, though development work is being quietly done on a few locations."

As yet no bullion of any consequence has been taken out, but, with the erection of mills, this part of the hills is destined, at no distant day, to become one of the gold producing sections of the country.

Harney District.

This district is situated on Battle creek, about eight miles southwesterly from Rockerville. Placer mining has been carried on from the first settlement of the country, but no work of any magnitude was commenced until within a year, when the Harney Gold Mining Company was organized, which secured all the old claims for a long distance on the creek, as well as a number of high bar claims. They built in the past year about six miles of flume, bringing the water of Grizzly Gulch and Battle creek on to

Quartz mining did not in the past year command much attention, the miners being attracted from the precious metals to mining mica, the deposits of which in this district are quite extensive. A number of companies are engaged taking out mica, and many miners have suspended prospecting on their own account for gold and silver, to work for wages, or to prospect for mines of mica on their own account. A few have kept steadily at work successfully prospecting for or developing locations. Among these are Vieregg, Engle & Co., doing business under the name of the Grand Island Company. The district is crossed from northwest to southeast by a belt of quartz veins nearly a mile in width, many of which show good ore, although little work above the annual assessments, and in many locations not that much, has been done upon them.

Rockford Mining District.

This district is partly in Pennington and a portion in Lawrence county, and contains some valuable mines. It has a greater area than any other district in Pennington county, and a larger number of quartz mines. The mountain range of the Black Hills between Custer and Harney's Peak, the highest elevations in the hills, runs through the district. On the two principal streams flowing through the district, Castle and Rapid creeks, placer mining is still carried on to some extent by private individuals, who took from these placers in 1882 but little more than \$5,000. Larger returns will be reached as soon as men of capital can be induced to invest in these mines and employ hydraulic machinery.

having taken place is given by the ringing of an electrical bell. The apparatus used is very simple, and it is said to be thoroughly efficient in its action and reliable under all conditions.

Mechanical ventilation is fast displacing the furnace everywhere on the Continent, but more rapidly in France and Belgium than in Germany. In Belgium especially any alterations required to be made in the ventilative service furnish an occasion at once seized upon for the substitution of the fan for the older method. Very little novelty is to be seen in the design of fans, the Guibal or the Letetot being employed in almost every instance. But the greatest care is observed in their erection, and the teachings of experience are followed in all the details of their construction. Attention to these minor matters has led to an increase in the efficiency of these machines as well as their durability. The Continental practice of enclosing these structures under specially-erected buildings is also one that might be adopted with advantage elsewhere.

On and after the 15th instant the Central Pacific will run a fast mail train from Ogden, covering the distance between Ogden and San Francisco in thirty-nine hours. This will complete the fast mail service between New York and San Francisco and save twenty-four hours.

The House Committee on Public Lands has adopted Henley's report recommending the forfeiture of the unearned portion of the Northern Pacific land grant.

Principal Localities of Nickel Ore in America.

Chatham, Connecticut.

The locality at Chatham, Connecticut, about six miles from Middletown, yields both nickel and cobalt in combination with arsenic and sulphur. The ore occurs in mica slate. It is not now worked, but it was one of the first places explored for metals in New England. As early as the year 1661 the inhabitants of Middletown made a grant to "our much-honored governor, Mr. John Winthrop, for the discovery of mines and minerals and for the setting up of such works as shall be useful for the improvement of them." It is probable that the governor hoped to find silver, being misled by the white, shining ore. Neither nickel or cobalt had been discovered. About one hundred years later, in 1762, Dr. John Sebastian Stephany, a German, reopened the old works, and, in 1770, associated John Knoll and Gominus Eskelens with him, and worked the mine for cobalt. In 1781, January 1, President Stiles of Yale College wrote in his diary that Mr. Eskelens had visited him "full of his cobalt mine and China voyage. He some years ago bought the Governor's Ring, as it is called, or a mountain in the northwest corner of East Haddam, comprehending about 800 acres, or about a square mile area. Here he finds plenty of cobalt, which he manufactures into smalt, with which is made the beautiful blue of chinaware." Some twenty tons of cobalt ore appear to have been shipped to China from this locality. Nothing more appears to have been done for thirty years. In 1818 Mr. Seth Hunt, of New Hampshire, worked the mine for three years, and expended about \$20,000. The ore was taken to Glazenbury and stamped by hand. He obtained, as he supposed, about 1,000 pounds of cobalt and shipped it to England, where it was found to be nickel, containing only a low percentage of cobalt. The difficulty in separating the nickel from the cobalt caused him to abandon the property. The mine was again reopened by Professor Charles U. Shepard in 1844, but with no greater success.

In 1853 an attempt was made to work the mine on a larger scale than before, and a company known as the "Chatham Cobalt Mining Company" was organized for the purpose. The assays made at the time upon the dressed ores show that they contained about 18 per cent. of nickel and cobalt, in nearly equal quantity, or 9 per cent. of each. The firm of William Coffin & Co., then operating in nickel at Camden, near Philadelphia, offered to take all the ore that could be produced, up to 200 tons annually, of that grade, and pay \$200 per ton (of 2,240 pounds) for it on the wharf at Philadelphia. Cobalt at that time was worth 14 shillings sterling per pound, and nickel \$1.70 per pound. According to a report by Mr. Simonin it appears that the average metallic contents of the ore as mined, before dressing, was 2.2 per cent. The property was examined and reported upon in 1855 by Prof. Jas. C. Booth, of the United States Mint, who found that the ore crushed and washed in a Bradford's ore separator yielded a product averaging about 20 per cent. of the oxides of nickel and cobalt in nearly equal parts. This company made a good display of the ores and products at the International Exhibition, New York, 1853. The second annual report of the company, by Dr. Francfort, the manager, though very complete as regards the amount of machinery and facilities for working brought together during the eighteen months after the organization, is silent as regards the production, which it may be assumed was comparatively insignificant. The enterprise was soon after abandoned. It is believed that a small quantity of nickel from this source reached the Mint.

Other Localities in Connecticut.

There are small quantities of nickel at other places in the ancient schists of Connecticut. The principle localities, however are at Torrington, where nickel ore was once mined on a considerable scale, most of it being sent to England, but the undertaking was an unprofitable one, and was not long continued. The Litchfield nickel mine is about 10 miles further south, and yielded ore similar to those obtained at Lancaster Gap, in Pennsylvania. Neither of these localities have been worked for many years. The mines are full of water, and an old furnace formerly used for smelting the ore is in ruins.

Orford, Quebec.

The sulphuret of nickel (millerite) is found in the township of Orford, Province of Quebec, Canada, and has been described by Professor Hunt, and later by Mr. W. E. C. Eastis, of Boston. It is disseminated through a mixture of green chrome garnet with calcspar and through the adjacent rock. The ore is very lean; 508 pounds run through the small blast furnace at the Massachusetts Institute of Technology gave 8 pounds of matter, or alloy, containing 71.84 per cent. iron and 22.70 per cent. of nickel.

Thunder Bay.

Mr. W. M. Courtis has directed attention to a nickel ore containing 4.50 per cent. of the metal, with some cobalt, from Silver Harbor, on the west side of Thunder bay, on the north shore of Lake Superior, and at other places inland. The ore of Thunder bay is niccolite associated with native silver, and occurs in a vein traversing Huronian talcose slates. Another locality on Heron bay affords an ore con-

taining silver and gold and 9 or 10 per cent. of cobalt and nickel.

Wallace Mine.

Nickel ore occurs also on the north shore of Lake Huron, in Canada West, at the Wallace mine. Sir William Logan, the director of the geological survey of Canada in 1863 describes this ore as a fine steel-gray mixture, whose analysis, after deducting earthy matters derived from the gangue, gave in 100 parts: Iron, 41.79; nickel, 13.93; arsenic, 6.02; sulphur, 38.16; copper, 0.10. Another sample specimen gave 8.26 per cent. of nickel. The nickel contains about three parts in a thousand of cobalt. This Wallace mine was originally opened and worked as a copper mine in the years 1848 and 1849. About three easks of nickel ore were taken out and shipped to a gentleman in New York, who had it smelted and a part of the product worked up into dish-covers, and sold the remainder for making nickel silver. The ore occurs in quartzose and chloritic schists. A specimen analyzed by Messrs. Partz and Buck yielded 6.80 per cent. of nickel. A company was formed to work this property, but it did not succeed.

Mine la Motte, Missouri.

In Missouri the ancient Mine la Motte has furnished considerable ore, from which nickel is obtained in the form of matte, which is generally exported. Some of the earlier supplies of nickel at the Mint for the small nickel bronze coins were obtained from this source.

California.

Nickel ore occurs associated with chromite in Kern county, in this State, but this locality has hitherto furnished only samples.

Oregon.

A new deposit of nickel ore has recently been brought to notice, and is extremely interesting, inasmuch as the ore closely resembles the ores from New Caledonia. It is essentially a hydrated silicate of nickel oxide and contains from 20 to 30 per cent. of nickel oxide (in selected samples) and an average, perhaps, of 10 per cent., though the locality has not yet been sufficiently worked to determine satisfactorily what the ore will average in large quantities. The locality is in southern Oregon, in Douglas county, at Piney mountain, about eight miles from Canyonville. It was discovered in 1881. It is described as corresponding exactly in its association and mode of occurrence with the description given by Professor Liverridge, of the New Caledonia ores. These are found in serpentine with chromite and steatite. In Oregon the ore is found in bunches and pocket-like accumulations in serpentine with chromite. Analyses have been made by Dr. Hood, who gives his results in comparison with the New Caledonia nickel ores as follows:

ANALYSES OF OREGON NICKEL ORES, COMPARED WITH THOSE OF NEW CALEDONIA.

	Oregon ore, A.	Oregon ore, B.	Garnierite.	Nomineite.
Silica.....	48.21	40.55	47.23	47.90
Iron & aluminum oxide.....	1.38	1.33	1.66	3.00
Nickel oxide.....	23.88	29.06	24.01	24.00
Magnesia.....	19.90	21.70	21.08	12.51
Water.....	6.63	7.63	5.20	12.73
	100.00	100.24	99.82	100.14

There is not properly any mineralogical distinction between garnierite and nomineite. The ore is mainly a mechanical mixture or "infiltration, penetrating and charging absorbent magnesian rock with greater or less amounts of nickel. The composition is not constant. The color varies from rich dark green to a pale whitish green, according to the amount of oxide of nickel absorbed. It is by some authorities referred to the old species pimelite, but it appears to contain more silica and less water than that species.

Nevada.

Dr. T. Sterry Hunt also cites a nickel ore from western Nevada, describing it from a sample submitted to him in 1876 as a greenish translucent, amorphous mineral with black stains, resembling chrysocolla in appearance. Analyses at the Massachusetts Institute of Technology, gave oxide of nickel 3.23 per cent and oxide of cobalt 3.88 per cent. This is probably the same kind of ore, and from the same locality, near Columbus, which yielded some ten tons, but much richer in nickel than the sample analyzed, shipped from San Francisco to Swansea in 1882.

Colorado.

Mr. F. F. Chisolm reports that nickel in small quantities, with its associated metal, cobalt, is found in many veins throughout the Rocky mountains; but hitherto mining for nickel exclusively has not been prosecuted, except at the Gem mine in Grape Creek canyon, Fremont county, Colorado. Here the metal occurs quite abundantly, and is associated with silver. Some tons of ore were mined and shipped to New Jersey for reduction, but the trial apparently was not successful, as work on the mine has been discontinued. Nickel occurs in the ore from some mines at Leadville, in small quantities.

British Columbia.

Dr. James Blake has noted the occurrence of nickeliferous sand on Fraser river, British Columbia.

Lancaster Gap, Pennsylvania.

But of all the localities cited, the only one

which has exerted an important influence on the development of the metallurgy of nickel in the United States is that of Lancaster Gap, in Lancaster county, Pennsylvania. Mr. Joseph Wharton, of Philadelphia, leased the mine January 1, 1863, and finally purchased it May 6, 1867. He is now the only producer of metallic nickel in the United States.

The ore of Lancaster Gap is the nickeliferous pyrrhotite, containing in bulk from 75 to 2 per cent of nickel. It is enriched at the mine by smelting into a matte containing 10 per cent or more of the metal, and in this condition the nickel is taken to Camden, New Jersey, opposite Philadelphia, for extraction. There is associated with the pyrrhotite the mineral species millerite, in crusts and layers formed of a close aggregation of the slender crystals which give a velvet-like surface to the crusts when formed in cavities. Specimens several inches broad are frequently found, and from one-eighth to one-quarter of an inch in thickness.

Nickel ore from this mine was treated as early as 1850, though the mine had been previously worked for copper. Works for the extraction of nickel from the Lancaster and other ores were first started in Philadelphia, and in 1853 Messrs. F. M. Buck, E. W. Coffin, and others erected nickel works at Camden, supplying them with ore from the Gap mine. These were the same persons who proposed to work the Chatham ores. Mr. Wharton leased the Camden works May 13, 1863, and purchased them January 19, 1869. They were then greatly enlarged and extended.

A large portion of the metal produced at these works by Mr. Wharton has been used at the United States Mint for the subsidiary small coins, and a considerable amount has been exported. Since the development of nickeling by galvanism a large part of the product has been put into the form of nickel salts and anodes.

The Oil Fields in California.

Writing to the *Pittsburgh Dispatch* from Newhall, Mr. J. W. McKinley gives the following account of the oil fields of that region:

On the edge of the town is located the refinery of the company, connected by pipe lines with the wells, a few miles distant. Leaving Newhall, we drove to Pico canyon, the principal producing territory of the region. As we approached, we saw away up on the peaks the tall derricks in places which looked inaccessible; but no spot is out of reach of American enterprise and perseverance. In one of the wildest spots of the canyon, about thirty men were making the mountains echo to the strokes of their hammers upon the iron plates of a new 20,000-barrel tank. Along the canyon are scattered the houses of the employees of the company, most of whom have recently come from Pennsylvania. Near one of the houses was a graded and leveled croquet ground, with a little oil tank on a post for lighting it at night. Farther up we came to a cluster of producing wells, with others at a little distance on the sides of the mountains, or even at the top, hundreds of feet above our heads.

The first well was put down about eight years ago, but more has been accomplished in the last two years than in all the time previous. One well which we visited has produced 130,000 barrels in the last three years, and is still yielding. There have been no very large wells, the best being 250 per day, and the average being about ninety barrels; but they keep up their production with scarcely any diminution from year to year. Drilling has been found difficult, as a great portion of the rock is broken shale lying obliquely. The tools slip to one side very easily, and a number of "crooked holes" have resulted. One driller who lost his tools altogether in a well, and finished it with new ones. The cost of putting down a well is from \$5,000 to \$7,000, depending upon depth, etc. Most of the wells are from 1,200 to 1,500 feet, but some have yielded at a much less depth. One well of 270 feet depth produced 40 barrels per day for about three years, has been deepened, and is now yielding even more. Another one of 800 feet is said to have produced 200,000 barrels in the last five or six years. Drilling has been very successful in striking oil in paying quantities wherever there were indications of its presence.

The Pacific Oil Company now has 27 wells producing or drilling, and during the last two years has been rapidly widening the scope of its operations. It has now from 30 to 40 miles of pipe lines, and is preparing to lay 20 miles more, to connect its land with ocean shipping at Ventura. The producers of California have a great advantage in their proximity to the ocean, which gives them free commerce with the outside world. Crude oil is now sold at \$3 per barrel in Los Angeles, and the oil companies are making immense profits. There is a very large amount of oil territory as yet undeveloped, and a rich reward awaits enterprise in these regions.

In the Camulos district, which lies west of the San Fernando, are even stronger surface indications of oil than there were in the Pico canyon. We first went up the Brea canyon, in which are numerous outbursts and springs of oil. Ascending the mountain west of this canyon, we could plainly see the break in the mountains crossing from the San Fernando through this district to those beyond which have been developed. A couple of miles farther west, the Hooper canyon stretches back

over two miles into the mountain, and is full of oil. Great pools of oil fill its water-courses that are dry at present. Hundreds of barrels of oil must be wasted away and evaporated during a year. A well put down only 90 feet by horse power struck light oil in considerable quantity, and, had it not been for the death of one of the owners and the consequent suspension of operations, would doubtless have yielded in large quantities at the depth of a few hundred feet.

The mountainous territory between these two canyons will probably in a few years be the scene of great activity. In the Little Sepe district, a few miles west of Camulos, a 125-barrel well was struck at 1,500 feet recently. The Santa Paula region, a little farther west, is also yielding large profits to the parties developing it.

Difficulties of Mining on the Comstock.

Superintendent W. H. Patton, who has the distinction of having mined out more gold and silver than any other man that ever lived, recently gave the *Reno Gazette* some interesting information about mining on the Comstock. He says a foot of timber was put into the bonanza for every dollar taken out. They paid \$120,000,000 and into the hole left was packed 120,000,000 feet of timber worth 2 cents a foot. The timbers were laid in rather loosely and occupied about two-thirds of all the space, the one-third being divided up into thousands of cracks and openings in the corduroy, as it is called. The top earth keeps caving in and compresses all this work into one solid mass and finally the cave reaches the outer crust and the surface settles. By this process 12-inch timbers are crushed to seven, or nearly half their size. In these dark and distant caverns the wood decays and forms gases which are frequently heard exploding. The wood is set on fire and year after year it smoulders and smokes in a slow but terrible way. There are many places in the mines where the smoke works its way out and can be plainly smelled in the air. The largest body of territory that has been worked out and closed up is in the old bonanza mines, and extends from the 1,200 to the 1,950 levels, and is 1,300 feet long. It was worked out from 10 to 200 feet wide, and filled with timbers. There are many places in it now on fire, and it will smoulder for centuries unless it gets a draft of air somewhere, when it would break out into a terrible blaze. The gas generated in this way is of the deadliest character. It is confined by air-tight bulkheads 60 feet thick of solid timbers. Where the air has a downcast this is more necessary than the up-cast shafts, which carry the gas out into the air instead of down where the men are at work.

There are three separate currents in the system of ventilation in the mines of the Bonanza Company. One is down the C. & C. shaft to the bottom of the 2,900 level and up the Bonner shaft. It carries 16,000 feet of air a minute. The second is down the Ophir shaft and up Con. Virginia. It goes to the 3,100 level, carrying 20,000 feet a minute. The third is down the Union and up the old Sierra Nevada shaft. It reaches 2,900 feet and carries 12,000 feet a minute. This air goes down fresh and dry. At the bottom it gets heated up to 100° or over, which increases its capacity for absorbing moisture. It comes out steaming from the mouth of the shaft, and thus carries out of the mines 16,000 gallons of water a day, equal to a stream of 1 miners inch of water. Mr. Patton thinks the heat is caused by chemical action. There is some lime in the rock and it would create heat when dissolved in water. Many think that feldspar makes heat when it decomposes to form kaoline. The mines are no hotter at 3,100 feet than at 1,500 except when a vein of hot water is tapped. That makes it seem hotter than it really is by heating up the air and at the same time increasing its moisture. Moist air at 110 deg. is hard to endure than dry air at 120 deg. Mr. Patton keeps a record of the water raised and he says it does not increase with depth. They have struck no new water at all, but drain all the levels above. No supply of water from the surface reaches them. They feel neither wet seasons nor dry at such depths. Mr. Patton says that there is no reason to be discouraged at the prospect for the Comstock. The ledge is perfectly defined and of as favorable formation for ore as it ever was. There are many streaks of good ore through it, and any day a bonanza might be struck. He says he can handle rock as cheaply at the 3,100 with the machines now there as he could on the 1,500 with what they had then. If there is a body of \$50 ore 20 to 50 feet thick and he can find it he will be able to hoist and mill it for \$20 a ton, which will make Virginia City shine again.

BESIDES the Paradise Valley Company, which is now paying dividends regularly, several others are at work in the Paradise mines. Nick Frayer reports that he has found good ore in the Live Yankee, and Braunan and Marcott are taking out rich ore in the Rattler. The success of the Paradise Company under Superintendent McCurdy's management will, it is believed, induce other companies who own mines in the vicinity to resume operations this summer, with the view of developing them.—*Silver State*.

It appears that too many miners are crowding in at Coryville. The Hawthorne papers say it is useless for more men to come there in search of work.

Rusting Reduction Works in Arizona.

The *Quinto Prospect* says: The question naturally arises, "How is it that so many fine mills and smelters are going to ruin in a country that is constantly calling for more reduction facilities? To the new arrival it seems a marvel, but it is no mystery to one who has resided for some years in Arizona, and watched the manner in which mining schemes have been gotten up. That there is any lack of mineral in this country none, we suppose, will venture to assert. Nor that reduction works, when erected as a sound business proposition, fail to pay well. Witness the 'Clip mill in Silver district, which is paying \$1,000 a day, the Esperanza mill at Oro Blanco, the Jessie Benton mill at Owl Heads, the Silver King mill, which has paid over a million dollars in dividends, not to mention the Tombstone mills, and many others.

These properties are not blazoned forth every week in the papers. They and many others work quietly along accumulating wealth for their fortunate owners, who work them at home, not on the New York or San Francisco stock boards. Many mines also, which are seldom heard of are being profitably worked on an economical plan, without an expensive office and board of mismanagers.

Now, as to the other manner of operating. A party of eastern capitalists hear of our wonderful mineral resources and commission an "expert" to find them a good opening for their superfluous cash. Mr. Expert arrives here, and you will suppose, goes to work to find a valuable property. Oh no! that is not what he is after. He hunts up some poor devil of a prospector, whose shirt hangs out of his breeches, and who has half a dozen more or less worthless locations, which he would be delighted to sell for \$500. Says Mr. Expert: "You give me a bond on these properties for \$50,000 and when the sale is made I will pay you \$5,000." Needless to say the offer is accepted. The sale is made. The miner gets his \$5,000, of which he will have perhaps five dollars left in three months, the "expert" pockets \$45,000, and a handsome fee. A company is incorporated with well-salaried officials and handsomely furnished office. A young nephew of one of the owners, who has been clerking in a New York law office, and don't know the difference between a winze and a windmill, is sent out as a superintendent, at \$300 a month. The first thing to be done is to develop the mines? Not a bit of it. To build a mill, of course. So up goes a fine twenty-stamp mill. Then about a fortnight before it is ready for work, they commence to look over their claims for ore, and find they haven't got any. Mill shuts down—if it ever started. Super goes back to Gotham and tells about Apaches and native silver; there is one more monument to the folly of eastern capitalists, and one more nail in Arizona's coffin.

That this description is not exaggerated, few who have resided five years in Arizona will deny. The moral is "see that you have a mine before you build a mill."

A Queer Location.

The Prescott *Miner* says: The following mining location was to-day recorded by the County Recorder at the request of the person who made the location. As will be seen it is probably the most extensive and unique instrument of its kind ever placed on record:

LOCATION NOTICE.

AFRICAN MINE.

I, the undersigned, have located this Grove as a placer mine according to the laws of South Carolina. This claim is square, being twenty-five miles long and fourteen wide, and takin' in all ranches and stock on it inside the aforesaid lines. I am a Soldier of the Cross, but have been on a furlough for the last ten years. This claim is located about twelve miles northeast of Prescott, and is in the Salt River Mining district. Dated on the ground, this, the 9th day of March, 1884. CALEB TAYLOR.

Too Many Miners.—We are informed by a party lately returned from the Quijotas that of the 800 or 1,000 men at that camp, only twenty are employed in the mines, the others, Micawber like, are "waiting for something to turn up." The mines, he tells us, are not sufficiently developed yet to allow of an opinion being formed of their richness. One mine, recently sold for \$120,000, and which has been published far and wide as a veritable bonanza, is nothing more than a prospect hole eight or ten feet deep. Many old Clobetites who hastened to the new camp when the excitement first began, are reported as strapped and wish themselves back again amongst us. The old reliable camps may suffer for a time from these meteoric excitements, but the tide will soon ebb and bring back what we have lost, with interest.—*Arizona Silver Belt*.

The Reno *Journal* says: There is some style in a mine like that owned by Ed. Harris. The other day it became necessary to pay off his hired men, and to do that he sat down with his hand mortar one day and pounded out \$1,300, squared his accounts, and went on with the work of development.

In the reduction of silver ores and other metallurgical operations between 2,000 and 3,000 tons of salt are disposed of annually on the Pacific coast.

USEFUL INFORMATION.

WHY EYES SHINE.—Place a child (because the pupils of children are larger) and by preference a blonde, at a distance of ten or fifteen feet from a lamp which is the only source of light in a room, and cause it to look at some object in the direction of the lamp, turning the eye you wish to look at slightly inward toward the nose. Now, put your own eye close behind the lamp flame, with a card between it and the flame. If you will then look close by the edge of the flame covered by the card into the eye of the child, you will see, instead of a perfectly black pupil, a reddish yellow circle. If the eye happens to be hypermetropic, you will be able to see the red reflex when your own eye is at some distance to one side of the flame. This is the true explanation of the luminous appearance of the eyes of some animals when they are in comparative obscurity. It is simply the light reflected from the bottom of their eyes, which is generally of a reddish tinge, on account of the red blood in the vascular layer of the choroid back of the semi-transparent retina, and not light that is generated there at all. This reflection is most apparent when the animal is in obscurity, but the observer must be in the light, and somewhat in the relative position indicated in the above-described experiment—that is, the eye of the observer must be on the same line with the light and the observed eye. The eyes of nearly all animals are hypermetropic, most of them very highly so, so that they send out the rays of light which have entered them in a very diverging manner.—*Popular Science Monthly*.

WHAT IS THE BLUE GRASS REGION?—This is a question strangers almost invariably ask. Strictly speaking, the Blue Grass Region of Kentucky is quite extensive, but the term, in its popular sense, applies only to the remarkable body of land in the center of the State, which comprises six or eight counties surrounding Lexington. This favored district, which a scientific authority has styled "the very heart of the United States," is underlaid by a decomposable limestone, which imparts to the soil an unsurpassed fertility, and gives to our grass, known to botanists as *Poa Pretensis*, a rich and permanent luxuriance which it attains nowhere else. Hence the term "The Blue Grass Region," a synonym for the acme of fertility of a district, which also bears the proud distinction of "the garden spot of the world." But why our grass is called "blue," when it never is blue, is one of the unsolved problems. It is always green except when in bloom, when the heads have a brownish-purple tint. If, however, the term "Blue Grass" is meant for an abbreviation of blue limestone grass, then it will do, for certainly it only reaches its highest perfection on our wonderful blue limestone soil. Propagated without cultivation, it comes up thick and juicy early in the spring, ripens in June, renews its growth in autumn, and, retaining its verdure in spite of snow and ice, furnishes abundant and unequalled pasturage during the entire winter. It is believed to be indigenous.—*Rancher's Guide to Lexington, Ky.*

ANOTHER USE FOR PAPER.—What cannot be made out of paper is something which cannot yet be safely decided. A Hartford, Conn., man has lately taken out patents for devices by which very beautiful and substantial carpets can be made of paper at prices much lower than the cost of common cotton matting. This new fabric even seems to have qualities entirely superior to ordinary carpets. It can be doctored so as to resist water, fire and insects without losing any of the soft elegance which is common to fine woolen carpets. So saith the inventor and his friends.

RAILWAY CARS DRAWN BY CAMELS.—It is said that railway cars drawn by camels will shortly constitute one of the peculiar features of travel and transportation in Central Asia. It is proposed by the Russian Government to lay a line of rails from Khiva, which is south of the Sea of Aral, in Turkestan, to Tashkend, a place of 40,000 inhabitants, nearly 600 miles further east. The road is to be built on the Blecher system—a kind of raised railway resting on peculiarly-placed sleepers—and will follow the course now taken by caravans.

A METHOD for rendering buildings fire-proof was tested in Chicago recently. The inventor claims for his design to confine the fire to the floor upon which it originated by covering the ceiling with thin sheet iron, and placing between it and the joist 3 or 4 inches of ashes, and above and around the space more ashes, on which the floor is laid. The test proved all that the inventor claimed for it, the joist not being damaged, though the heat was very great.

THE STORY told of a German needle-maker who bored a hole through a hair and threaded it like a needle has been denied; but now comes a New York paper which says the truthfulness of the story was recently demonstrated, or rather the fact that the story might be true was established by a Newark mechanic who plucked a hair from his own head, bored it at the first attempt, seamed the eye and threaded the curious "needle" with a silk thread.

A NEW BICYCLE DEVICE.—An Englishman has patented a device by which the front

wheels of two bicycles may be so joined as to permit the machines to be driven tandem by two riders. The advantage of this form of riding is that falling forward over the handles is rendered quite impossible, and another is that a greatly increased pace is attainable. Ascents and descents can thus be made when previously it was necessary to dismount.

THE LATEST NOVELTY A POCKET STEAM HEATER. Connecticut has been the birth-place of many novel inventions, but the device which the New Haven *News* describes as having been recently produced by a Bridgeport professor is surpassed by none of them in originality and daring. The paper referred to says of this invention, called the "portable body steam heater," that the apparatus is a small affair, consisting of a copper boiler, under which is a diminutive lamp, all incased in a nickel box, and balanced something like a compass, so that, no matter what position the outside box is in, the boiler and lamp will always remain in the required vertical position. The entire apparatus is so small that it can be carried in the pocket. After the lamp is lighted, the water in the boiler is heated and circulated through rubber tubes, which run down the legs, around the ankles, up around the back, and back to the boiler. The circulation of the warm water keeps the body warm on the coldest day. A safety-valve and escape for a higher pressure of steam than the affair is allowed to carry flows off at the back of the wearer's neck. Elaborate heaters are being constructed for ladies' wear. They can be worn inside the bustle, and entirely obscured. Before going out of the house the lady's maid can light the lamp, which, by the way, is gaged to run six, eight or ten hours, and "my lady" walks out under a full pressure of steam, and warranted to keep warm during the promenade.

THE LARGEST MATCH FACTORY in the world is located in Sweden. It contains an enormous novel machine which produces, it is said, 1,000,000 boxes of matches daily. Blocks of wood are fed in at one end of the machine and at the other end the matches come out arranged in boxes ready for packing. Twenty steamers and eight sailing vessels last summer delivered the wood from which the matches are made.

WHEN it becomes necessary to stop an engine with a heavy fire in the furnace, place a layer of fresh coal on the fire, shut the damper, and start the injector or pump for the purpose of keeping up the circulation in the boiler.

SPARKS FROM THE LOCOMOTIVE.—A prominent master mechanic asserts that a locomotive, drawing a train of six coaches and burning soft coal, throws out from 40 to 50 bushels of sparks in a run of a hundred miles.

GOOD MEALTH.

At Dinner.

At dinner, it is hardly necessary to say, we obtain a due proportion of the fats and oils in very varied forms. It is true we do not emulate the nutritive existence of the Esquimaux, whose dietary of blubber and fats constitutes the *summum bonum* of a life spent amid perpetual snow. But the quantity of fatty matters we daily contrive to ingest in one form or another is very considerable. From animal foods the fats are readily obtainable, and from vegetables, oils of various kinds are also elaborated. The necessity for fat as an article of diet is seen when we learn from physiology that it not merely conserves heat—a function seen in whales and fat persons generally—but supplies material when it passes into the blood which affords our bodily fuel. Fats and oils are "heat producers," and it is when the fat of the blood and the oxygen inhaled into that fluid from the air come into chemical combination, that heat is produced. It is needless to add that this process is being continually carried on in the human body, and to a greater or less degree in that of all other animals. "The starches and sugars" form the final materials into which we may resolve our dinner. A large variety of substances figure in the lists of chemists under the above designation. Common observation demonstrates that we daily consume large quantities of the starches and sugars in our food. A potato, for instance, may legitimately enough be described as a mass of starch and water; rice, and allied substances, are three-fourths starch; from bread we obtain a large quantity of starchy matter—all vegetables, in fact, contain starch in considerable proportions. Of the various "sugars" chemically so called, the latter remark practically holds good. Even milk—nature's typical food—contains a proportion of sugar in the form of sugar of milk, or lactine; and in the muscles of animals another peculiar "sugar" is found. There can be little doubt that from sugars and starches we obtain matters which, in the economy of the body, are readily converted into fat.—*Belgravia*.

Physiology in Schools.

The importance of a more thorough and practical study of physiology in schools is attracting much attention in all parts of the country. Essays in medical journals, addresses by prominent members of the medical faculty, and well

written articles in many of our local papers attest to the increasing interest that is being taken in this direction. We notice in a late number of the Los Angeles *Times* that Mrs. Dr. Sawtelle Dean, of the Woman's Medical College in this city, recently delivered an address before an audience of ladies in the Y. M. C. A. Hall of Los Angeles. One who was present speaks of the address through the columns of the *Times*, as follows:

"In eloquent and affecting language she portrayed the misery, suffering and so-called misfortune by the death of hundreds of thousands of infants in the United States, of persons sent to hospitals, insane or other asylums, and countless numbers at large of weak or unsound mind, deformed or ill-formed bodies, all arising from the culpable ignorance of mothers, wives and nurses. She advocated organized effort to render the hospital and other sanitary and humanitarian work what it ought to be and cannot be without woman's sympathy and co-operation.

"It is a small compliment to say that womanly hearts and tears were moved by her touching appeals."

By unanimous vote she was requested to take up the same subject on the following Wednesday evening, before an audience of both ladies and gentlemen in the same hall.

Appropos to the above a New York telegraphic dispatch of April 2d, in regard to the introduction of physiology and hygiene into public schools of that city, says: A large number of New York public school teachers met last night at the Broadway Tabernacle for mutual congratulations on the passing of the bill which provides for the instruction of pupils in all schools supported by public money or under State control, in physiology and hygiene, with special reference to the effects of alcoholic stimulants and narcotics upon the human system. It was stated that popular publishers were about issuing a series of cheap text books applying to the effects of alcohol on the system. The new law, which goes into effect next January, obliges teachers applying for a certificate to pass an examination in physiology and hygiene.

BOILED AND RAW MILK.—The cookery of milk is very simple, but by no means unimportant. That there is an appreciable difference between raw and boiled milk may be proved by taking equal quantities of each (the boiled sample having been allowed to cool down), adding them to equal quantities of the same infusion of coffee, then critically tasting the mixtures. The difference is sufficient to have long since established the practice among all skillful cooks of scrupulously using boiled milk for making *café au lait*. I have tried a similar experiment on tea, and find that in this case the cold milk is preferable. Why this should be, why boiled milk should be better for coffee and raw milk for tea, I cannot tell. If any of my readers have not done so already, let them try similar experiments with condensed milk, and I have no doubt that the verdict of the majority will be that it is passable with coffee, but very objectionable in tea. This is milk that has been very much cooked. The chief definable alteration effected by the boiling of milk is the coagulation of the small quantity of albumen which it contains. This rises as it becomes solidified, and forms a skin-like scum on the surface, which may be lifted with a spoon and eaten, as it is perfectly wholesome and very nutritious.—*W. Mattieu Williams in Popular Science*.

TOOTHACHE.—Those suffering from toothache will do well to follow this advice, as it is founded upon actual experience: For ordinary nervous toothache; which is caused by the nervous system being out of order, or by excessive fatigue, a very hot bath will soothe the nerves that sleep will naturally follow, and upon getting up the patient will feel very much refreshed, and the toothache will be a thing of the past. For what is known as "jumping" toothache, hot, dry flannel, applied to the face and neck, is very effective. For common toothache, which is caused by indigestion or by getting some strong sweet acid or anything very hot or cold in a decayed tooth, a little piece of cotton, steeped in strong camphor or oil of cloves, is the best remedy. But it should be borne in mind that a healthy person suffering from toothache must have been transgressing some of nature's laws, and that the pain is a warning that had best be heeded before it grows to something more serious.—*A. N. H.*

DEATH FROM PHYSICAL EXCITEMENT.—Cases in which death results from the physical excitement consequent on mental passion are, according to the *Lancet*, not uncommon. A recent instance has again called attention to the matter. Unfortunately, those persons who are prone to sudden and overwhelming outbursts of ill temper do not, as a rule, recognize their propensity or realize the perils to which it exposes them; while the stupid idea that such deaths as occur in passion, and which are directly caused by it, ought to be ascribed to "the visitation of God," tends to divert attention from the common sense lesson which such death should teach. It is most unwise to allow the mind to excite the brain and body to such extent as to endanger life itself. We do not sufficiently appreciate the need and value of mental discipline as a corrective of bad habits and a preventive of disturbances by which happiness and life itself are too often jeopardized.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

MAHONEY.—Cor. *Amador Ledger*: Taking the water out of the Mahoney progresses slowly. Several mishaps in the way of breakages have occurred since they started. A few days ago the chamber of the pump at the 500-foot level broke, which necessitated having a new one cast and put in. This will cause a delay of four or five days, and in that time the water will rise about 75 ft. They expect, however, to have the water all out in less than two weeks. G. W. Horn, the present foreman, is uncertain how long he will remain. After the water is out, if everything looks favorable, he may remain and take permanent charge of the works. S. D. R. Steward is prospecting at the Lincoln in two places. Besides the contract let for sinking near the Mahoney mine, he has a set of men at work north of the old Lincoln shaft, in the hope of striking the ledge running in that direction. The old shaft is so badly out of order that it is doubtful whether it can ever be used again for active mining. The sides have come together to such an extent as to prevent the passage of a bucket. Everything is running about as usual at the Amador Consolidated. Twenty stamps of the mill are kept going. There is no change to report in the character of the quartz, but the prevailing opinion is that it is paying expenses.

RED MOUNTAIN.—*Review*, April 5: In less than thirty days the number of men working in Red Mountain mines and prospects will be more than doubled. J. G. McOllough owns the Dipper and Genesee lodes, but has done very little work on either as yet, although both show mineral. The working force on the Yankee Girl is to be increased to 30 men. Seventy-six sacks of the bismuth and silver galena are ready for shipment. They are worth nearly \$1,000 each. Messrs. Thurston and Olsen are pushing developments on the Lisbon and Ottawa lodes below the Yankee Girl. They expect to tap the vein with their crosscut, inside of ten days. The Independence, situated on Independence mountain, is developed by a 50 foot open cut on the vein. The ore is concentrating, and mill-runs from several shipments to Chicago give \$52 to the ton. The Denver lode in Humboldt gulch will rank as a fine producer next season. Development consists of a 30 foot tunnel that shows a fine body of galena ore running 60 ounces silver and 40 per cent lead. The Bonanza Boy shows a good body of gray copper ore, and it is the intention of the owners to push development as rapidly as possible, as they feel satisfied they have a veritable bonanza in their claim. The returns from the ore shipped last fall were very satisfactory. Some fine looking mineral has been struck in the lower crosscut of the famous National Belle mine. The ore is solid and seems to be of a different character to that found in the caves above. Shipments will be resumed as soon as the roads are in a more favorable condition. The Silver Ledge has been worked steadily nearly all winter, and there is now something over 600 tons of concentrating ore on the dump. The ore-body is galena with a streak of high grade copper ore running through it. Shipments will be resumed in the course of six weeks or two months.

Butte.

A RICH MINE.—*Butte Record*, April 5: Probably the richest mine ever operated in Butte county is that now owned and operated by Mr. W. C. Pershacker. The reports of deposits taken out are really wonderful, and the gold seems to be inexhaustible. Several thousand dollars' worth of Pershacker gold dust was shipped to San Francisco from Chico yesterday.

El Dorado.

MILL.—*Georgetown Gazette*, April 4: The Revenge mine near Greenwood, is having a good five-stamp mill put upon it. Mr. F. R. J. Dixon is superintending the mine. We have much confidence in this mine, and predict that it will pay from the time the stamps begin duty, and will soon acquire a reputation of stability and worth. In the first place we believe the mine contains sufficient ore to justify a five-stamp mill; secondly, that the management of the mine has been placed in good hands, and will be practically and energetically worked within economic bounds, contrary to the expensive red tape manner in which so many of our mines have been operated and floundered. This is our reason for believing the Revenge mine will prove a success. The Eastern owners have used good judgment in placing the working in charge of Mr. Dixon, who thoroughly understands his business, and further he is reliable; and still further the mill is to be operated by his son, Wm. H. Dixon, who is a practical amalgamator, always commanding the first place in a mill, besides being possessed of that highest of all recommendations, an upright character.

Inyo.

FURNACE FOR DEEP SPRINGS.—*Inyo Independent*, April 5: Mr. McMurtry, of Big Pine, has returned from San Francisco. He has perfected arrangements to move the old Montezuma furnace across the mountains to Antelope Springs, Deep Spring Valley, where it will be put to work on ores of that section. The furnace will be moved immediately.

BONDED.—The noted Kearsarge series of mines and the old ten-stamp mill has been bonded for a large amount to P. J. S. Tulley, the agent, who is backed by millionaires. Work on the mines will be commenced as soon as the snow will permit. This move has the true ring, and is founded on true business.

THE QUEEN.—Work on the famous Indian Queen mine, in Onocota district, has been prosecuted all winter with a force of 16 men. New ground is now opened by a long, deep tunnel, and preparations are being made to start the mill as soon as the deep snow clears away.

SNOW CANYON.—The mill at Snow canyon started up on Saturday last for a run of 25 days or more. The ores are from mines belonging to Stapp & Morton and to Bob Mitchell and Billy Smith.

THE MODOCK.—Supt. Fitzgerald says of late operations at the Modock works at Lookout: "Amount of ore received at furnace during the week, 51 tons; the output is now increased to nine and a half tons per day. The Antelope mine is opening

up very well; the shaft is down 18 ft, and 21 tons of ore have been extracted in sinking it. The furnace cannot be started up before the 21st inst., as coal is not coming in fast enough."

Mono.

CLOVER PATCH.—*Inyo Independent*, April 5: Messrs. Nixon & McDermott, with a force of nine men, have been engaged for several months in opening out the Wild Rose mine at Clover Patch, in Southern Mono. The developments are such as to insure the steady running of the five-stamp mill until next fall. The snow lies all over the country to a depth of from four to ten ft, rendering locomotion impossible and the matter of getting in supplies extremely difficult.

STANDARD CON.—*Bodie Free Press*, April 8: Last week there were extracted and shipped to the mill 481 tons of ore, and 1,118 ounces of crude bullion were received. Yesterday \$11,427 were shipped to the company. North drift No. 2, 700 level, has been run six ft; total length 170 ft, showing six ft of vein. The upraise from this drift has been raised nine ft; total height 139 ft, to a point where the vein is six and a half ft wide, and continues broken and mixed with porphyry.

BODIE CON.—Since the last report they have started a drift south from the west crosscut on the 200 level to connect with upraise No. 1 from the 300 level. This drift is on the Fortuna ledge and has gained a distance of 18 ft. So far it shows ore of a low grade. Upraise No. 1 on the 300 level has reached a height of 162 ft, without any change. The south drift, 300 level, Fortuna vein, has gained a distance of 20 ft; total length 198 ft, no change. The upraise on the 422 level is up 104 ft—a gain of eight ft. The vein is one and a half ft wide, with spots of good ore; but, on the whole, it is of a rather low grade. The ore for the mills is principally taken from the Vulcan vein.

GOODSHAW.—On the first of the week the work was changed to the south drift on No. 3 ledge, 600 level. The face of the drift shows about two ft of good quartz, the vein matter being about 6 ft wide. The indications are very encouraging for a valuable development.

BODIE TUNNEL.—The crosscut, run by contract, was pushed ahead about 10 ft, on ground that is quite promising. They will probably have something encouraging from this part of the county very soon.

BULWER CON.—The south drift from west crosscut No. 2, 500 level, has been advanced 12 ft during the past week; the total length being 173 ft. The vein still holds a width of 15 inches.

PLACER MINING.—*Helena Independent*, April 4: Now is the time when the placer miner begins to set his boxes and prepare for spring sluicing. Tools are gathered from under the bunks and in the corners of the cabin, a new supply of "quick" secured, more grub, another man or two, and the work goes bravely on. To the placer miner, more than to any other, perhaps, the opening of spring is the beginning of a new era. After chafing in his cabin or lounging about the more populous places all winter, the prospect of once more engaging in the exciting and pleasurable pursuit of washing the "pay dirt," is something those only can appreciate, who have engaged in the business. But year by year the mines are becoming exhausted, and the men who worked them are gradually drifting into other business. Still, placer mining will be carried on for many years in Montana. Although considerably reduced in numbers and richness, there are numerous gulches that pay a handsome profit. Snow is plentiful on the ranges, and of course there will be an abundance of water to sluice with; and before long the sacks of dust to be exchanged for legal tender notes and coin will be considerable.

Mariposa.

THE MARTIN AND LEARY MINES.—*Herald*, April 4: J. H. Dunshie, mining expert, visited the Leary mines on Devil's gulch last week, at the instance of Dr. W. N. Martin, of San Francisco, a partner of Mr. Leary's. A *Herald* representative met Mr. Dunshie at the Gallison hotel last Sunday evening, and asked him what opinion he had formed of the mines. He stated that the value of the different claims had been greatly misrepresented by outside parties to Dr. Martin, for he considered them all promising mines. The quartz prospected well and could be worked at a fair profit, the only drawback as far as he could see, was the difficulty of ingress and egress to the mines. The placer mines he thought were excellent, as it would be an easy matter, with the facilities he has for working them, for Mr. Leary to make \$10 a day for every man employed. Three men are now working the placer claims.

Napa.

MINES NEAR CALISTOGA.—*Calistogian*, April 4: Messrs. Grigsby & Johnson have decided not to sink their shaft, in which work has been going on day and night the past winter, to the depth proposed last fall. It is now 160 feet deep, and a station will be made at this point, and drifting toward the Palisade and Easley veins be commenced. This drift or crosscut will necessarily be 118 feet long through very hard rock. When the Palisade vein is reached, a distance of about fifty feet if we remember correctly, more men will be set to work and ore be taken from this vein, while other miners will continue the drift toward the Easley vein. This change of programme will result in more extensive operations at an earlier date than was formerly intended. But the 118-foot drift will perhaps require four months for its completion, and probably little of importance will be done until it is finished.

Nevada.

TRINITY MINES.—*Transcript*, April 4: Geo. Gray and son are working a quartz ledge on Piety Hill. They having a good crushing out and yesterday it was being hauled to the mill. Locklin & Co., who have several quartz ledges near Worrell's ranch, have resumed work. The late high water in Deer creek did a great deal of damage to their reservoir and ditch, and the mine was filled with water. It is now pumped out and everything is running smoothly. Their mill is running on custom rock at the present time. They have just completed a crushing of 35 tons for a Willow valley company, and yesterday contracted to crush another lot of 100 tons for another prospecting company in the same locality. Since the bonanza has been developed in the Hussey & Hussey claims there is a great deal of prospecting going on in that section. Indications point very strongly that lively times are in store for that rich and long-neglected quartz district. Durbin & Co.

are making preliminary arrangements to start up their mine. They have a good prospect, but only sufficient work has been done on it to comply with the law for many years. A hundred ft of tunnel was run. The ledge shows from two to three ft in thickness and is of low grade. The owners did not have the capital to go in search of a pay chute which is believed to be there, and work was suspended. The Durbin will soon be heard from now there is such great activity in quartz in the Willow valley district. The McCormick quartz property, on Gold Flat, from all indications promises to equal if not excel any in this district when the proper work is done on it. It requires considerable capital to open it up, it should be, and the owner is not in a financial condition to carry the work forward. He has sunk two perpendicular shafts and an incline down on the ledge. The incline is down about 95 ft—both the shafts, perpendicular, being about 35 ft from the surface. When this distance was reached, with a very light pumping rig, the water drove the miners out. They, however, succeeded in getting some specimen rock which was "lousy" with gold, and would certainly yield \$4,000 or \$5,000 per ton. Owing to the heavy influx of water, the extent of this rich strike in the incline shaft is not known. At the two perpendicular shafts, which were sunk some distance apart, the specimens taken out were very rich, giving evidence that the find was a very valuable one. Pumping has been resumed in the incline and before long we expect to learn more particulars of Ham. McCormick's bonanza. If fully opened this mine would give employment to one or two hundred men. The Mountaineer mine, adjoining the Merrifield on the east, is increasing in value every day. They are taking out some splendid looking rock and the San Jose stockholders are in receipt of regular dividends. At the Wyoming, adjoining the Merrifield on the west, some very rich rock is being taken out. Yesterday morning Supt. Buffington brought into town a five gallon can filled with rich specimens. Many of them looked as though they were all gold, being without much quartz. The Champion Company are taking out some fine looking rock. The new shaft, which is down about 100 ft, has tapped a fine looking ledge. Workmen are still running the main tunnel in the direction of the new shaft, which is about 300 yards from the line of the Nevada City mine. The stockholders have strong faith in the mine proving a success. It ought to, situated as it is in the known rich quartz center of this district.

RICH QUARTZ.—*Transcript*, April 4: Some of the richest quartz ever seen in this or in any other country was taken out of the Wyoming mine on Saturday last. Some of the pieces contained more gold than quartz, and reminded one of '49 times when specimens of that character were more common than now. Over \$2,000 was taken out in a very short time, and there was more in sight. One of the pieces was a beauty. It was a piece of quartz about 12 inches wide and 18 inches long, and in it was a streak of solid gold two inches thick running through the entire piece. Such a discovery as this in any other part of the world would attract thousands of people to the place. The Nevada City quartz mines present a better appearance than in any other section of the State, and we believe there are hundreds of ledges in this region that won't show up as well as the Wyoming the same amount of work done on them. There is no better field for prospectors than this part of the country presents.

Plumas.

BETTER.—*Greenville Bulletin*, April 4: Mr. Johns was down at the Rich Gulch mine last week, and not being quite satisfied with the looks of the mine, asked for an extension of two months on the time fixed for closing the contract for the purchase of the mine. This was readily granted. Since then the ore body has opened up far superior to any hitherto seen there. The work of opening continues at the expense of the Plumas Eureka company, Mr. Halstead has the privilege of working all the ore that is taken out, and is said to be making a good thing of it. No doubt is entertained that if Mr. Johns had delayed his visit another week the purchase of the mine would at once have been consummated.

HALLSTED LEDGE.—*Plumas National*, April 5: Our readers will remember that some time last fall Mr. Wm. Johns, as an agent for the Plumas Eureka company, bonded the Hallsted quartz mine, on Rich Gulch. The bargain was that the company should put in a tunnel at a depth of 200 ft, to tap the ledge, and then have the privilege of drifting away from the tunnel a certain distance. If then satisfactory, they were to buy the mine, the price fixed on being \$60,000. The work has been done, and last week Messrs. Johns and James went down to the mine. They report that it looked very encouraging, but did not consider that it had been satisfactorily developed, and asked for and obtained an extension of time to look into it further, until July 1st. The force of men has been increased, and work will be pushed vigorously for the next three months. A rumor is afloat that some rich rock has been broken since they came back, but we have but little faith in the report. It may be true, however, as the rich pay chimney which shows above must be near the header below. There is good reason to believe that a large and permanent quartz property will be the result of the work, and if the Plumas Eureka company purchase it, they will work it in such a way as to make it profitable to the owners, and of great public benefit.

Placer.

HYDRAULIC MINES RUNNING.—*Grass Valley Union*, April 4: The *Euc*, acting as the watch-dog of the Anti-Debris Association has its smelter constantly turned in the direction of the hydraulic mines, and is now claiming that all the claims in the vicinity of the Dutch Flat (with the exception of the Gold Run, which was enjoined) are in active operation. As the claim alluded to, and many others throughout the mining region have never been enjoined by the courts there is no reason why they should not be at work. It does not follow that because a few mines have been enjoined the others must shut down in consequence. They are not in contempt of court.

Sierra.

CLEANUP.—*Mountain Messenger*, April 5: The cleanup for last week at the Extension works was nearly 214 ounces. A quartz boulder containing 20 ounces of gold was found.

WILL DRIFT HEREAFTER.—*Sierra Tribune*, April 5: The Sears Water Company recently notified Col. B. F. Baker, owner of the Pioneer mine at

Grass Flat, that unless he paid \$32,000 within 10 days for water furnished him last year and in advance for that to be used the coming season, that they would cease to supply him. Col. Baker was in town a few days ago and declared his intention of canceling the contract heretofore existing between himself and the Sears Water Company, as he has no further use for the water. The reason of this is that he has decided to work his mine by the drifting process in the future. The Pioneer ground is very rich and there is no doubt but that it will pay equally as well to drift as it did to work by the hydraulic process. We are informed that the owner will employ white men exclusively under the new regime. It is to be hoped that other mine owners over in that section will follow Col. Baker's example in this latter respect.

NOTIFIED TO STOP WORK.—Word was received here Sunday that a notice had been served on the Brandy City Mining Company to stop work within six days and in case they failed so to do lawful proceedings would be commenced against them forthwith. This is the first blow Sierra county has received from the valleyites. Oh, no, they won't trouble any mines in Sierra county. That is the kind of bait the Marysville people used in fishing after the trade from this country, but they had no idea of following it out, as the sequel shows.

MORE CAPITAL COMING.—We understand that J. H. Thomas, the mining operator, is on his way from Europe to this State and that he comes with a million and a half of capital to develop drift mines in northern Sierra and Plumas counties. Mr. Thomas has been across the water for some time trying to get capital interested in this enterprise. We only hope that he has succeeded as fully as the reports indicate. If he has, our northern neighbors may look for lively times in the course of a year or so.

San Bernardino.

BULLION REPORT.—*Calico Print*, April 5: The Bismarck mine shipped \$4,662 in bullion to San Francisco on the 31st of last month. Twelve tons of first class ore from the Garfield mine was shipped to San Francisco on the third. The Oho Grande mill shipped on the 29th of last month, \$6,530 in silver bullion to San Francisco; on the 31st \$3,000, and on the 1st inst \$5,100. We have received the following authentic report of the bullion product of the Bonanza King mine of Providence. The amount for the year 1883 was \$573,375.85. For the month of January \$56,277.53; for February \$44,967.78. Total yield to March 1, 1884, \$674,620.16.

BONANZA KING CON. M. CO.—We learn from a reliable source that the west crosscut North 5th level has been driven 90 ft on the ore vein, connection having been made between the 4th and 5th levels on this ore vein, which render available a large extent of sloping ground. A winze has been sunk on this ore vein to the depth of the 6th level, showing a continuous body of ore. The north lateral drift, 5th level, will have to be run 50 ft to intersect this winze. Crosscut opposite shaft 5th level has cut the center main vein of ore, giving assays of \$48 per ton. The new ore body is 100 ft further east than any former development, close to the contact of lime zone and porphyry; at this point it is 10 ft wide, assaying \$200. The main shafts are being sunk and is now 20 ft below the 8th level. The past severe weather has delayed ore hauling, and consequently effected the usual product of bullion. For the first three weeks of this month \$33,600.48 has been shipped to San Francisco. The mine throughout is yielding finely and never looked better.

Trinity.

PAYING WELL.—*Trinity Journal*, April 5: From the Messrs. Blakemore, who were in town last week, from Eastman district, we learn that they have made two partial cleanups of their armata and that the amount realized averaged \$110 to the ton of rock crushed. When a final and complete cleanup is made it is expected the average rate will be considerably increased. We are further informed that they will now push prospecting in the mine with a view to determining the extent of the ore body and that if it proves nearly as large as it promises a mill will be erected during the summer.

HYDRAULIC MINERS are all at work, with a fair supply of water. More could be used if it would come.

Tuolumne.

RICH STRIKE IN THE BUCHANAN.—*Union Democrat*, April 5: We learn that a chute of extraordinary rich ore has been struck in the Buchanan mine. The strike was made in a drift north of the shaft, on the 300 level. The vein is very wide, averaging five or six ft, and shows great strength. The chute has been drifted on upwards of 40 ft, and still maintains its full size, showing no signs of pinching out. Messrs. John A. Davis, Alvinza Haywood and William Hamilton went up Sunday and examined the mine, and expressed themselves as highly pleased over the showing. They brought down some large pieces of ore, which were really magnificent to look at. It is a beautiful ribbon quartz, with streaks of coarse free gold running through it. The specimens shown are exceedingly rich, but the posted ones say there is plenty more of the same character. From reports it would appear that a veritable bonanza is in sight. Some of the quartz has the same characteristic of the Lamphier rock, having free gold intermixed with and clinging to the sulphurets. This important development will probably give additional impetus to mining in this section.

NEVADA.

Washoe District.

ALTA.—*Enterprise*, April 5: The east drift on the 2150 level is being advanced in ground, showing more quartz than heretofore. There is not much increase of water. The west drift on this level is in vein material that shows streaks of quartz carrying some metal. The pumps are working well, and handle the water without any difficulty.

GOULD AND CURRY.—The drift on the 2700 level is making good headway in very fair working ground. It is still very hot. The drift north from the 2200 level of the Bonner shaft is making good headway and will soon reach the Consolidated Virginia line, its objective point.

COMBINATION SHAFT.—The west drift from the 2800 station is making good headway. It is of sufficient width for two car tracks. A good circulation of air will be obtained as soon as connection is made with the southeast drift of the 2800 level of the Hale and Norcross.

HALE AND NORCROSS.—The southeast drift on

the 2800 level is being pushed ahead as rapidly as possible to the point where it will connect with the drift west from the Combination shaft. The ground works well and is of a favorable appearance.

SIERRA NEVADA.—The northeast drift on the 3100 level is making the usual progress, and is passing through vein material of a promising appearance. The winze between the 2300 and 2400 levels is being repaired.

UNION CONSOLIDATED.—The water has a good deal drained out of the ground to the east of the main north and south drift, and east crosscut No. 2 is again being advanced.

MEXICAN.—Are sinking the winze on the 3100 level. West crosscut No. 3 is making the usual headway, and good progress is making in east crosscut No. 2.

ANDER.—Some ore that will pay for working is still being obtained, and the prospecting drifts are developing quartz of a promising appearance.

YELLOW JACKER.—The usual amount of ore is being extracted, and the mills on the river are kept going to their full capacity.

ONIAK.—Are extracting ore on the 150 and 250 levels, and are running exploring drifts on both levels.

BELCHER.—The usual quantity of ore is being extracted and sent to the mills on the river for reduction.

SCORPION. The usual progress is making in the west drift, and the material shows no special change.

IMPERIAL.—Some ore that will pay for working is being found in the explorations on the old upper levels.

CROWN POINT.—The usual amount of ore is being extracted, and all the mills are running regularly.

SAVAGE.—There is still a considerable flow of water from the north drift on the 2600 level.

BEST AND BELCHER. The usual headway is being made on the 2700 level. The drift is still quite hot.

U'FAIR.—Are running a north drift on the 1950 level at a point 75 feet east of the station.

UNION SHAFT.—Are repairing the drain drift on the 1600 level leading out to the Suro tunnel.

CALIFORNIA.—The east drift on the 2900 level is making the usual progress.

CONSOLIDATED VIRGINIA.—The east drift on the 2900 level is making the usual progress.

Columbus District.

SILVER BOY.—*True Fissure*, April 4: Flattering results have been obtained from the work done on this property. Another ledge has been cut in the tunnel. It is much larger and stronger than the one previously encountered. The ore is of high grade, the lowest assay being \$81 per ton. The ledge dips to the north, the same as the first one found, and it is probable the two will connect and form one large body of high grade ore. The appearances indicate that the mine will prove a bonanza for its owner, Johnny Leidy, who is much elated with his prospect. The mine has been visited by several people, all of whom speak of it very flatteringly. As it lies at the eastern end of the chloride belt, it will cause more active operations among the claims in its neighborhood. The ore looks like and is of nearly the same character as that found in the Northern Belle and Mount Diablo mines. There is a fair supply of water and wood near the mine, and a good road to it can easily be made. The old Mount Diablo quartz road could be utilized, the mine being situated within two hundred yards of it.

COLUMBUS CON.—The crosscut from the fourth level was extended 10 ft. during the week, the face showing no material change. The main drift on the third level has been extended 5 ft., making a total length of about 260 ft. There is no change in the face, it being about the same as at the time of the last report. The west drift, from the main drift on same level, has been extended 10 ft. Its total length is now about 60 ft. No development has been made in this drift, but the prospects are very flattering.

MOUNT DIABLO.—There are no special changes to report from the mine for the past week. Winze No. 5 is now down 124 ft. and a drift will soon be started from the bottom of the same to connect with the east drift from the bottom of Winze No. 4. In the intermediate, between the second and third levels, a crosscut is being driven to the south from the Callison winze, and has developed some low grade ore.

Taylor District.

ARGUS.—White Pine *News*, April 5: A new strike of much importance is reported in the Argus Company's mine, 125 ft. below the surface. The Monitor mines are looking better than at any time in the past, and vigorous prospecting is going on.

White Pine District.

THE EBERHARDT.—*News*, April 4: Work at the Eberhardt tunnel is, at the present time, conducted with a force of 12 miners. It is a well known fact that the ore has been discovered in the main tunnel, and the unbounded confidence that Supt. Drake has in the property is shown by the improvements he has made there, and the extensive work he is doing lead the knowing ones to think that the ore bodies are of much greater importance than the managers of the mine care for the outside world to know of. As soon as the weather moderates and machinery can be moved with ease, an extra force of 20 men will be put to work in the tunnel, and prospecting will be carried on by means of Burleigh drills. There are several places in the main tunnel where streaks of ore have been found that will assay from \$70 to \$700 a ton, and it is the intention of Capt. Drake to prospect some of those, in the belief that they will lead to important bodies of ore.

ARIZONA.

BAD ROADS.—*Pinal Drill*, March 29: The renewed rain has again so damaged the roads that all hauling of ore and wood is stopped. The Silver King Company's mine and mill are both idle, the first because they have too much ore on hand which they cannot get rid of; the latter because they have not got the ore at the mill. The "Windsor" Company's mill at Pinal is rented to the "King" Company, who have taken it on a lease of one year. Mr.

Wheeler is working the Eureka mine on rich ore. The "Australia" is charged with ore which cannot be hauled over the wet roads, and the smelter is therefore idle and out of wood. The wagon road and chute are finished. The usual work goes on in the district as far as weather will permit. The "Lost Prize" is as promising as ever. They have now a double compartment shaft of considerable depth from which to tap the vein. The "Specie-paying" has its mill building ready for the machinery, but like all the rest of mankind now, weather bound and at anchor.

BONANZA MINE.—*Quijotoa Prospector*, April 4: Work continues with unceasing vigor on the Bonanza Company's mines. As the tunnels acquire depth prospects are growing correspondingly better. The ore stringers that have been noticeable for the past few weeks are sure indications that the vein is not far distant. At any time the news of the tapping of the ledge may be given to the world. From calculations made by the *Prospector* (not allowing for a dip) the vein is still distant about 70 ft. The winze still continues to be driven downwards through high grade ore.

PEERLESS.—Tunnel No. 1, (east side) was in 130 ft on the 22d instant. At no time since the tunnel was started has the outlook been so favorable as it is at the present time. Stringers of ore are coming in through an oxide of iron formation which is very soft. Tunnel No. 2, (west side) has attained a length of 100 ft. The formation is very similar to that given in last week's report.

PEER.—Peer tunnel No. 3, (west side) is 85 ft in length, and is being driven through the same kind of rock that it has been going through for the past 20 ft.

CROCKER.—Tunnel No. 4, (east side) was in 77 ft when the last measurement was taken, which was on the 22d instant. The formation was heavily stained with iron and was softer than last week. Stringers of ore and quartz are becoming more common, and the outlook is much better than it has been since work was commenced.

HORSE MOUTH.—The Horse Mouth cut was in 16 ft on the 26th instant, and all in ore that runs from \$10 to \$60 per ton.

WINZE.—The winze on the 22d instant was down 35 ft in high grade ore. Sinking is being pushed as fast as possible.

SHEEP NEST.—The tunnel in the Sheep Nest mine is being pushed as rapidly as skilled labor can advance work. It continues in good ore and the prospects never have been more favorable than they are at present since work was commenced on it. Some of the principal owners of this mine are expected to arrive this week from San Francisco.

NOTES.—*Prescott Courier*, April 3: Mr. McCann has found what is said to be a very rich and large copper mine, near Walnut Grove. Mr. Chase has started operations on Turkey creek and in Pine Flat. The shipment of ore from the Silver Belt has commenced. Judge McPhee and Mr. Rice think they have a good silver mine near Bumble Bee station, Black canyon district. They have an 18-inch vein of ore which assays over \$300 a ton. The Peck pump is engaged in trying to dry the mine, in which there is a great quantity of water. Mr. Clark will very soon place heavier machinery in his Groom creek mill. Placer miners are taking advantage of the present fine weather and abundance of water. They are washing a great deal of gravel and finding plenty of gold. We have heard of a few men here who talk of going to Cœur d'Alene. An effort is being made to induce men to go to the Sierra Madres.

COLORADO.

MINERAL MENTION.—*Colorado Miner*, April 4: A mill run from A. A. Walling lode, at Empire, gave a result of over \$100 gold per cord. The Rainbow lode, at Empire, shows in the slope from eight to ten inches of free milling ore, and in the breast of the main drift has over eight inches of ore. The free quartz runs over \$100 per cord and the iron about \$30 per ton, gold. The Tom Moore lode, on Columbian Mountain, is coming to the front with fine prospects. The northwest end of the lode has been opened by open cut, and shows a small but very rich streak of ore. The crevice is well defined and the quartz streak about ten inches thick. The Choctaw lode, on Saxon mountain is proving to be a better lode than even the owners thought it was. A mill-run this week went 170 ounces silver and 60 per cent lead. This lode is the property of Barnes, Cherry & Tonay. Frank Hartsell will soon start up work at the Moline tunnel again. This is one of Clear Creek County's largest producers, and we are glad to hear of the resumption of work. Mr. Hartsell is now preparing to place at the tunnel a new plant for compressed air drilling, which will greatly facilitate the work. The Virginia mine, situated in Spring Gulch, near Dumont, owned by Mr. Ed. Peart, is proving to be one of the best mines in that portion of Clear Creek County. The crevice is over three feet wide, and the mill-dirt, without sorting, that comes from it, runs three and one-half ounces in gold. The smelting ore is from five to eight inches in width. Mr. Peart brought a load of ore to this city last Wednesday, that gave him the handsome returns of four ounces in gold, and 35 ounces in silver.

DUMONT.—The Keith tunnel is being driven ahead rapidly. The Senator improves right along with development. The Big Horn lode is now under lease. We expect to hear good reports from this claim in the near future. The Standard lode now has exposed a vein of smelting ore about ten inches thick, and about two and one-half ft. of smelting stuff. A carload of ore from the California will be shipped, the fore part of the ensuing week, to Denver. Regular shipments, it is expected, will be made semi-monthly. The old Virginia is panning out right along. Sixty three sacks of auriferous quartz were shipped from this claim Wednesday, to Georgetown.

IDAHO.

FROM MULDON.—*Wood River Times*, April 2: Colonel Bullantine, superintendent of the Little Wood River Mining and Smelting Company, came into Hailey to-day, for the first time this winter. He reports Muldon pretty badly snowed in, and provisions and supplies on hand for only 30 days longer. A force of about 15 men has been kept at work all

winter on the company's mines, doing development work. In running drifts, etc., between 400 and 500 tons of ore have been extracted, which are now in the yard at the furnaces. There is a large quantity of ore in sight in the company's mines, and the supply is ample to keep the two 40-ton furnaces going uninterruptedly. These will be blown in as soon as the weather and roads permit—which, from present appearance, will not be before the middle of May.

THEY WILL GO.—*Idaho Statesman*, April 5: The rush to the Cœur d'Alene mines is reaching alarming proportions in spite of all the cold weather that is being poured on the business. True, there is comparatively little actually known about the extent and richness of the mines, but people will believe that where there is so much smoke there must be considerable fire, and they will go and see for themselves. The coming summer will see many thousands of people in those mountains, a handsome percentage of whom will remain and develop whatever resources there may be in that country. There is a vast unexplored and unprospected mountain region to be examined this year, and it is quite within the range of probable events that there will be enough good mines discovered and developed to secure a large and permanent mining population.

CŒUR D'ALENE ITEMS.—*Nugget*, March 29: The "Widow" is being regularly worked, and is paying well. On Granite creek, three dollars to the pan has been found during the past week. An offer of \$50,000 was made last week for the Mother lode, and was refused. Work has been commenced on the Union ditch which is to furnish water to work the claims between Osborn and Eagle City inclusive. The work will be conducted under the management of J. W. Porter, the lessee of the Pritchard claim, and will probably be completed in about one month, and will carry from 1,000 to 1,500 inches of water. It hardly seems as if laboring men, or those willing to work, ought to starve in a forest country where wood brings from \$12 to \$15 per cord, and is scarce at that price. Good prospects are reported from Perry gulch, near Eagle City. One party reports having panned out seventeen cents to the pan. Two men dug a hole about four ft. square down to bedrock and cleaned up two ounces of gold, near Murrayville, last Wednesday. Wood has risen from ten to twelve dollars per cord for four foot and from fifteen to eighteen dollars per cord for stove wood. The reason is that every stick has to be drawn one or two miles on little sleds or toboggans, and the road is so bad that three men can hardly cut and haul a cord per day. The proprietors of the Mother lode have a strip uncovered a few feet square, in which, it is estimated by experts, \$2,500 worth of gold is in sight. The rock is literally filled with it. Fifty dollars has been offered for the privilege of cutting off a small slab of this rock, and \$5 per specimen is frequently offered for small pieces. All offers, however, are refused. The spot is kept covered from sight, and is carefully guarded.

QUARTZ CLAIMS.—In Fancy gulch, about four miles from here, Henderson, Porter & Co. have a very large ledge that shows free milling gold. As soon as the snow will permit, a tunnel will be run and a cross-cut of the ledge will be made. Employment will be given to a large number of men. This claim is known as the Golden Chief, and promises well. J. B. Stevens & Co. own an extension of the ledge on which the Golden Chief is located. This extension is called the San Francisco, and the quartz is of the same nature, and also shows free gold. The owners of these two claims will put up such milling machinery as may be necessary to work the ore, providing the developments justify present expectations. Those acquainted with these claims have high hopes of their richness, and of the quantity of good ore in the ledge.

MONTANA.

NEW MINES STRUCK.—*New Northwest*, March 5: Mr. John F. Straubal, of St. Paul & Co., Garrison, gave us yesterday some items concerning a placer find near the Palmer ranch, on Lower Warm Springs creek. The find has been rumored for several days, but even as yet little is known concerning it. It appears that not long since John and David Irwin, two Leadville men, prospecting near the mouth of the creek, but more recently have gone three miles up the creek, which we believe would take them below the falls, and commenced work. On Friday evening of last week they came into Garrison, hired seven men, outfitted them with picks, shovels and provisions, and started back. They had some placer gold a sample of a few dollars of which Mr. Straubal purchased. It is not much washed, has considerable quartz in it, and is very coarse. They were uncommunicative and did not desire to give any more information than could be avoided. Wednesday night of this week the entire section gang on the Northern Pacific at Garrison—nine men—left and went over to Warm Springs creek, some five or six miles, to the diggings. It is stated the claims are being taken up in 20-acre lots. Mr. Straubal, on Wednesday, bought all the picks in Deer Lodge, and is having more made. Mr. Phil. E. Evans went to the scene of the find yesterday, and on his return more definite information will be obtainable. The find is northeast of the Pike's Peak, or Yamhill district, and not far distant. The striking of paying mines there is not improbable.

ANACONDA.—*Cor. Butte Miner*, March 5: Active operations are in progress at the smelter. Not far from 100 men are on the pay-roll, and about the same number are in the employ of the railroad contractors. The heavy cuts north of town are rapidly nearing completion, and it is believed freight by rail will be delivered here inside of sixty days.

THE ORIGINAL.—The Original M. Co. of Butte yesterday declared its thirty-second consecutive monthly dividend of \$3,000, making a total of \$96,000. A good reserve is on hand. The mine is in good shape, the production of good ore is regular, and the usual monthly dividend is assured for a long time to come. Operations in the property are confined to the extension of the east 200 foot level, to the development of the vein at a depth of 400 ft and to the stopes from the winze between the 300 and 400 levels. The ore is of uniform grade, averages in assay value \$75 per ton, and is shipped for reduction to the Colorado smelter.

NEW MEXICO.

KINGSTON.—*Mining Herald*, April 5: The U. S. mine is taking out fine high-grade shipping ore.

The Forest King, with 300 feet of development done looks well. From the Kingston mine beautiful specimens of ruby silver are obtained. The Iron King mine comes to the front with 30,000 tons of ore on the dump. The Polar Star mine has been stocked, and everything ready for an early start. The Superior is taking out ore which averages from nine to fifteen hundred dollars a ton. There is enough ore in sight in this mine to keep two hoisting engines busy day and night. They are at present working the 200-foot level and extending the 300-foot level, to eighteen inches in width, of 600-ounce ore, at a depth of 12 feet. The ore lies in lime, and dips toward the lime. The owners are sacking the ore preparatory to shipping. A magnificent strike was made a few days ago on the Brush Heap. It consists of sulphide ore which assays 1,000 ounces to the ton. The Brush Heap people are patiently waiting for the smelter to open up, when they will be able to dispose of the large quantity of ore now lying on the dump. The concentration works of the Kingston Mining and Milling Company are in full blast with a double force of men. They are now running ore from the Bullion mine, and reduce about ten tons per day. Before this ore runs through the works it is worth about forty dollars per ton, when worked it is worth \$300 per ton. Mr. F. G. Caldwell is the superintendent in charge. The new hoisting works on the Bullion are now completed, and working satisfactorily. The drifts are rapidly being cleared of the ore and waste which had accumulated while the working shaft was being sunk and the machinery put up. A carter car comes up loaded with sacks containing the rich ore for which the Bullion is famous. As soon as the drifts are entirely cleared a large force of men are to be put to work. It is surprising to consider the short time in which, under the able management of Mr. Chapman, the Bullion arose from a mere prospect to one of the richest mines in New Mexico.

MAGDALENAS.—Large blocks of galena ore have been found on the Ambrosia, weighing 20 tons or more. The Kelly runs 40 per cent and upwards in lead, with silver from 10 to 50 ounces to the ton. The ore runs about 45 per cent lead, and as high as 50 ounces of silver to the ton in the Stonewall. The Mackay lode has a shaft of 65 feet, and is very rich in chlorides, native and horn silver. Assays run from 80 to 600 to the ton. The Lucky is six feet between walls, carries gray copper and brittle silver, and assays from 20 to 200 ounces in silver. The pay streak is about 20 inches in width. On the Juanita a cut across the vein of 50 feet from one wall does not reach across it. In this cut is found one ore body 13 feet thick and another 6 feet thick.

OREGON.

NEWS.—*Jacksonville Times*, April 5: The Shepley claim in the Siskiyou is yielding some fine specimens of gold. Many of the miners in Josephine county will make a good run this season. It is reported that John Rush of Evans creek has discovered a rich bed of chrome. Much more rain has fallen in Josephine county than here; consequently, the miners have more water. Roten Bros., of Harris gulch, in Willow Springs precinct, are cleaning up and expect to do fairly. They have picked up some neat pieces of gold already. The supply of water is decreasing in some localities, and cleaning up has commenced. The season has not been a protracted one, but better than at one time anticipated. Wm. Bybee has returned from Josephine county. He informs us that he has discharged all the hands employed at his mines near Waldo, excepting two, who are cleaning up. The season has not proved a first-class one there. A Woodville correspondent, under a late date, sends us the following: Samuel Rush and son have struck good diggings on Evans creek. They picked up a piece recently that weighed \$650. John W. Robinson and Jesse Tyler of Sardine creek have put a pipe on their diggings and have done considerable work, considering the unfavorable season. They are gentlemen of enterprise and merit success.

UTAH.

REVIEW.—*Salt Lake Tribune*, March 25: The product of the week has been fair, and the usual activity characterizing the spring business begins to appear. There is less talk of the Cœur d'Alene country than for some time past, and a general opinion prevails that it would be better to wait for more definite information from there, and for some actual output of the mines. The bullion receipts in this city for the first three months of the present year, excluding the receipts of ore, were as follows: January, \$449,228.75; February, \$364,606.47; March, \$460,366.60. Total, \$1,274,201.81. The receipts of bullion in this city for the week ending April 2, inclusive, were \$112,455.92; of ore, \$8,820; of both, \$121,275.92. The receipts of the previous week were \$123,754.77, of which \$118,394.77 was bullion. The shipments from Salt Lake for the week ending March 29th, inclusive, were as follows: 36 cars bullion East, 908,598 lbs.; 1 car lead West, 24,881 lbs. Total, 37 cars, 933,479 lbs. The product of the Horn Silver for the week amounted to fifteen cars of bullion, valued at \$45,000, bringing the total product for the present year up to \$531,000. We notice that on the 2d inst. Horn Silver stock touched \$8 in New York. The Ontario shipped during the week thirty-eight bars of bullion, of the value of \$41,825.92. Total product for 1884 to date, \$428,569.67. The Crescent shipped during the week three lots of ore, aggregating \$8,820 in value. The storms and bad roads have materially interfered with the operations of this company, but it will doubtless be in fine shape before the next stormy season sets in. The Stormont sent up two bars of silver, \$2,910. The product of the Hanauer smelter for the week amounted to eight cars of bullion, \$16,900. The Vienna of Sawtooth sent down one shipment of bullion during the week, of four bars, valued at \$5,820. The Silver Mountain mine of Big Cottonwood has begun shipping ore again. The tunnel and shaft having been connected by an upraise, the mine now has good air and work is being pushed forward vigorously. The New Emma property at Alta is being cleared around the mouth of the tunnel, of the debris of the snowslide, and as soon as supplies can be sent up work will be resumed in drifting to the ledge.

IMPORTERS AND DEALERS IN

Assayers' Materials,

MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG-
GISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17
California St., San Francisco.

We would call the attention of Assayers, Chemists,
Mining Companies, Milling Companies, Prospectors, etc.,
to our full stock of Balances, Furnaces, Muffles, Crucibles,
Scorifiers, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast, we feel
confident from our experience we can well suit the demand
for these goods, both as to quality and price. Our
New Illustrated Catalogue, with prices, will be sent on
application.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes,
will be sent free upon application. Agents for the Patent
Plumbago Crucible Co., London, England.

DOWNIE
EUCALYPTUS
BOILER SCALE
Preventive and Remover.

(Patented May 8, 1883.)

In use in 1,000 Boilers on Steamboats, Locomotives,
Mills, Mines, Foundries, etc., in California. An

Infallible Preventive and Remover of Scale

Prevents the iron from rusting or pitting.

Shipped in ten gallon cases at 50 cents per gallon, by

DOWNIE B. I. P. CO.,
No. 7 First Street, - - San Francisco.

THE BEST IN USE!

This is the only Scientifically Constructed Bucket in
the market. It is struck out from charcoal stamping
iron. No corners to catch. No seams to burst. No
interior corners to clog up. It runs with great ease, and
half the power of the old style bucket. WILL OUT-
WEAR HALF A DOZEN OF THEM.

PRICES REDUCED.

CHICAGO FRASER & CHALMERS. ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the **LARGEST** and **BEST** APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns.

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Branton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. **SPECIAL FURNACES FOR COPPER SMELTING.** Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Hagglin or Olant and Old Abe Co., Black also Corliss Pumping Engines, 26x60, for hoisting and Pumping Works, for 2,000 feet deep. Baby Hoists for Prospecting, 4 H. P. to 6 H. P.

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail. **HALLIDIE IMPROVED ORE TRAMWAY.** We refer to Gen. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,760 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others. It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

Valuable Vault for Sale at a Bargain

A contractor has a thoroughly burglar-proof vault for sale. Dimensions, 4½x5 ft.; height, 7 ft. in the clear; weight, about 6,000 lbs. In perfect order throughout. Double doors inside. Single burglar-proof outside door, 1½ inch steel and iron combined. The bolt work is of superior and first-class quality in all respects, there being no better on this coast. Can be examined at any time. Write for further information. Address P. M., box 2361, S. F. P. O., or inquire at this office.

SPECULATORS and CAPITALISTS READ THIS!

I know where there are immense deposits of coal, worth millions of dollars. I need from twenty thousand to fifty thousand dollars, or more, to locate, enter and improve said coal lands, much of which is upon Government land. Any person having the money mentioned to invest can make arrangements with the advertiser to go out with him and see with his own eyes the immense quantity and value of said coal lands. I am fully convinced that any party investing in said coal lands can, in less than two years, realize at least one hundred dollars for every dollar invested. Any person possessing the requisite means and meaning "business," can address for two weeks, appointing time and place for interview.

A. B. "COAL,"
 Care of E. R. Robinson, P. O. box 1471, San Francisco, Cal.

N. B.—The advertiser can show the very highest testimonials concerning integrity and business capacity.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

BALING PRESS.—John D. Page, Sanders, Fresno Co. No. 295,672. Dated March 25, 1884. This invention relates to a new and useful baling press, and to certain improvements herein, consisting in a peculiar screw-shaped feeder and compressor, and in a guiding follower against which the feeder constantly presses the material until baled. The object of the invention is to provide a baling press in which the material shall be fed to good advantage, and be subjected to pressure throughout the entire operation, whereby a better and firmer bale may be made; and further, to make an effective and economical device. The material is fed in through apertures, and the feeder being revolved, it twists and feeds it down into the chamber against the spring follower, which is held continuously against it. As more material is screwed in by the compressor the follower recedes, and naturally its pressure increases until the bale is well packed and is ready for discharge through the side or top.

COUPLING FOR CAR-HEATING APPARATUS.—John J. Lacey, S. F., assignor to Lacey Automatic Coupling Co., Oakland. No. 295,255. Dated March 18, 1884. This invention relates to a means for heating cars from a detached or distant source of supply without the presence of fire in the cars, and it consists principally of a joint or coupling for pipes, extending beneath the cars, so constructed as to be automatically connected, and a passage opened throughout the whole length whenever two cars come together, and are coupled, thus enabling the inventor to convey steam, hot air or other suitable medium into heaters placed in each car throughout the train. The hot air or steam is conveyed from the engine, or a special source.

MACHINE FOR CASTING LEADS ON FISH NET LINES.—Erick Manula, Astoria, Oregon. No. 295,262. Dated March 18, 1884. This invention relates to a new and useful machine for casting the leads or sinkers on the lines which go to form fish nets; and it consists in a peculiar reel or winch upon which the line is wound, and having its circumference constructed to form one-half the matrix in which the line lies, and a projecting arm under which the reel passes forming the other half. It consists, also, in the means for conducting the molten metal into the matrix and cutting it off, and the means for clamping the two parts together during the casting.

BOILER SCRAPER.—Joseph Beare, Tombstone, Arizona. No. 295,854. Dated March 25, 1884. This boiler scraper consists in one or more frame sections having internally-serrated annular bands surrounding the tube, and radiating toothed wings for scraping the interior of the shell, and means for reciprocating said section or sections within the boiler. It consists further in details of construction whereby the tube scrapers may be rendered expanding, to enable them to move readily, and by which the shell scrapers may pass the rivets and seams of the interior.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walked with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

The Silk Floss Mattresses and Pillows manufactured by the California Furniture Manufacturing Company, 226 Bush street, are the best substitutes yet discovered for the e made of curled hair or feathers. They are in many respects far superior to either, yet they are much cheaper. To use them is a luxury. Try them, and you will be satisfied.

Mining Share Market.

The mining stock situation remains about the same, dullness continuing to prevail. Unless they strike something remarkable at Bodie, or on the Comstock pretty soon, the mining share market will drop out of sight altogether. In the latter place, at the north end, prospecting has been commenced on the 1950 level of the Utah, where there is a good deal of ground that has never been explored.

In the Sierra Nevada the main north-east drift on the 3100 level is still going ahead in vein material that shows frequent streaks of quartz of a favorable character. As yet no crosscutting has been done in this part of the mine.

In the California and Consolidated Virginia the drift on the 2700 is making good progress. When it connects with the main east drift it will give a circulation of air that will allow of the prospecting of a large area of ground.

All is going on well in the middle mines. Connection will soon be made between the southeast drift on the 2800 level of the Hale and Norcross and the main west drift from the Combination shaft. This connection will give a circulation of air which will allow of extensive prospecting operations in the Chollar and Potosi as well as the Hale and Norcross.

At Gold Hill all the leading mines are extracting ore of a good quality and the mills on the river are kept going to their full capacity.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Bullion Shipments.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

TATUM & BOWEN,

25, 27, 29, 31 Main St., near Market, San Francisco. and 187 Front St., Portland, Oregon.

MANUFACTURERS OF

Sawmill Machinery, Engines and Boilers.

SOLE AGENTS FOR

BALL'S PATENT HIGH-SPEED ENGINE,

Embodying a new, and the only correct, Governing Principle. Valve practically impervious to wear, and almost frictionless. No steam chest. For amount of power economically developed it is, at the same time, the finest and cheapest Engine in the world. One can be seen running at our works.

PRENTICE DRILLS.

R. HOE & CO.'S CHISEL TOOTH SAWS,

SIGHT DROP CYLINDER CUP.

WE ALSO CARRY IN STOCK:

Shive and Waters' Governors, Best Eastern Leather and Rubber Belt, Emery Wheels, Packing Waste, Etc.

DEWEY & CO.'S

Scientific Press

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

THE JENKINS STANDARD PACKING

For Sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "Jenkins Standard Packing," and is for sale by the Trade generally.

Manufactured only by

JENKINS BROS., 71 John St., New York.

New Book on Assaying Gold & Silver Ores.

By C. H. AARON.

For Practical Workers.—\$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scoriafication; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

N. B.—This is Part I of three volumes on assaying by the same author. To be followed by Part II—Gold and Silver, Part III—Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Engraving

Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the Mining and Scientific Press, San Francisco, at favorable rates.

An Easy Binder.

A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price, (size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Publishing Co.'s journals, Harper's Weekly, and Scientific American), 85 cents; postage 10 cents. Postpaid to subscribers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

TO THE LADIES.

MRS. ADCOCK, having just returned from the East, begs to offer to the public some of the FINEST GOODS ever imported to this coast at prices lower than ever before. An inspection is solicited.

IRON CASTINGS OF ALL DESCRIPTIONS.

Iron and Machine Works.

MACBETH'S —PATENT— STEEL PULLEY.

Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys. They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting. On account of their great lightness and the form of the arms, they absorb less power than any other pulley. They are the only pulley of the kind which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited),
LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

ST. LOUIS, Mo., Sept. 23, 1883

Messrs. Adolphus Meier & Co.—GENTLEMEN: We cheerfully certify that the "Heine Patent Safety Boiler" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, adaptability for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,
ANHEUSER BUSCH BREWING ASSN.

OFFICE OF SUP'T OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Chief Engineer: In reply to your inquiry of September 24, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Platz Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished

with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.

It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.

While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. SEND FOR CIRCULAR. Address

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

\$1,000 CHALLENGE!

PRICE REDUCED,

Jan. 1, 1884, to FIVE HUNDRED and SEVENTY-FIVE DOLLARS (\$575.00).

THE FRUE ORE CONCENTRATOR, OR VANNING MACHINE.

OVER 800 ARE NOW IN USE. Saves from 40 to 100 per cent. more than any other Concentrator; concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the office of Huckleley, Spiers & Hayes, No. 220 Fremont Street, San Francisco.

To those Intending to Manufacture or Purchase the So-called "Triumph" Concentrator, we Herewith State:

That legal advice has been given that all shaking motion applied to an endless traveling belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That we are and have been ready, at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of \$1,000.

A New Explosive!!

MORE POWERFUL THAN NITRO-GLYCERINE,

And Warranted Perfectly Safe.

THE VAN CAMPEN COMPOUND!

THE SAFEST AND BEST EXPLOSIVE IN THE WORLD!

H. D. VAN CAMPEN, the patentee, has been at work for many years to accomplish the work of inventing an explosive that would compete with nitro-glycerine and yet be safe to handle. He has finished his undertaking, and today has upon the market the safest and best explosive in the United States. We defy any explosive on trial to make us take back the above statement. Any person taking exceptions to our statements we will meet on trial, IN ANY KIND OF BLASTING.

FOR RAILROAD WORK, QUARRY WORK, OR MINING

Nothing can Compete with the Van Campen Compound.

It may be cut in pieces, stamped on the ground, jammed around, set on fire and burned up, and no explosion. REMEMBER ITS SAFETY. We will leave the buyer to be the judge, and by testing will prove all we claim. For Sale in car-load lots direct to the trade. PRICES LOW AND GOODS WARRANTED. Anyone wishing Compound, or further instructions, should correspond with

Underground Hydraulic Pumps.

At a recent meeting of the Mining Institute of Scotland, Mr. Robert Thomas Moore, a brother of the accomplished mechanical engineer Mr. Joseph Moore, of the Kieldon Iron Works in this city, read a paper on "An improved arrangement for working underground pumps by means of hydraulic pressure." The arrangement described was a form of pumping by hydraulics, advantage being taken of the fact that water is practically incompressible, and that if a pipe of any length be filled with water, a piston placed at one end will, if pushed forward, propel a piston placed at the other in the same direction. The leading ideas are: (1.) That the water confined in the pipe shall be pressed at not less than 1,000 lbs. per square inch, so that the plungers and pipes may be of small diameter. (2.) That there shall be a connection between the two mains, to do away with shocks. (3.) That the height of any lift may be 300 fathoms. (4.) That while the water in the plunger may travel at any speed from 80 feet to 100 feet per minute, the speed of the water in the pipes may be 300 feet per minute.

These preliminary remarks introduced the description of the system, which is the invention of Mr. Joseph Moore of San Francisco, and which has been applied at several places on this coast. The system is suitable for all the three classes of pumps. (1.) For pumps placed at the bottom of a vertical shaft. (2.) For pumps placed inside the workings. (3.) For sinking pumps. In all these cases the steam engine is placed at any convenient position on the surface. The advantages claimed for the system are: Its extreme simplicity; there being no valves employed, except the clacks of the pumps. The facility with which it can be applied at any distance from the engine. The small space which it occupies, in consequence of the high pressures used. There is no danger of fire, nor any heat from steam pipes. The engine on the surface can be much better looked after than if it were underground. It can be started although covered with water; and, if it is a sinking lift, can be raised up to the surface, if necessary. As compared with an engine working with pump rods, there is the entire absence of pump rods. From careful experiments it has been found that the friction due to the power pipes, and the power and water plungers, with properly constructed pipes and stuffing boxes, does not exceed 11 per cent, which is much less than the friction in pump rods.

Technical Society of the Pacific Coast.

The adjourned meeting of this new association was held in the Patent Room of the Mechanics' Institute on Saturday evening last, Mr. Specht in the chair. Mr. George Parry, chairman of the Committee on By-Laws, read those framed by the committee, which were, on motion of Mr. Allardt, adopted. It was announced that the total number of charter members who had signed the roll was 126. Of these there were 61 civil engineers, 30 mechanical engineers, 12 mining engineers, 11 architects, 6 chemists and metallurgists, 4 surveyors and 2 patent attorneys.

In order to perfect the organization, it was re-

Jones, Bowie, Molera, Hall and Percy were declared elected. It was intended that the professions should be represented as far as possible on the board, but the votes on the mechanical engineers having been divided, none of them were elected. Of the other professions, only a single candidate for each was nominated.

The full list of officers is therefore as follows: President, Col. Geo. H. Mendell, U. S. A.; Vice President, Geo. J. Specht, C. E.; Secretary, Charles G. Yale; Treasurer, Joseph Crockett; Directors, W. Hammond Hall (State Engineer); Aug. J. Bowie, Jr., M. E.; E. J. Molera, Major Wm. A. Jones, U. S. A., and Geo. W. Percy.

Some discussion ensued on the advisability of

The Cummer Engine.

An invitation having been extended to us, among others, to critically examine the practical working operation of one of the "Cummer" engines, constructed by the Cummer Engine Company, of Cleveland, Ohio, and recently placed in the Joshua Hendy Machine Works, at No. 49 and 51 Fremont street, in this city, who are the agents for their sale on this coast, we availed ourselves of the opportunity, and herewith present a cut illustrating the plan and elevation of these celebrated engines, which are meeting with extensive favor in the Atlantic States, this being the first of this special style or form of automatic engine

placed in operation here. These engines are constructed with a view to ensuring economy in the simplicity of mechanism, accessibility of parts, lubrication, adjustment for wear, excellence of workmanship and solidity, and elegance of form. Their simplicity of mechanism consists in the fact that, wherever it could be safely done, their builders have reduced to the fewest possible number of parts the train of mechanism designed for operating the cut-off, without neglecting, however, to combine in their construction those parts which are not only essential but advantageous to the use of steam. With regard to the accessibility of their parts, everything movable is in plain sight, and all parts requiring adjustment are within easy reach with ordinary

SECTIONAL VIEW OF THE CUMMER ENGINE.

PLAN OF CUMMER ENGINE.

solved first to elect a permanent Secretary. On motion of Major Jones, Mr. Chas. G. Yale, editor of the MINING AND SCIENTIFIC PRESS, was elected to the position. Mr. Allardt, in quite a complimentary speech, nominated for President, Col. George H. Mendell, U. S. A., and the Secretary was instructed to cast a ballot in his favor. On motion of Major Jones, Mr. George J. Specht, C. E., was nominated for Vice President, the gentleman having been mainly instrumental in organizing the society. The Secretary was instructed to cast a ballot for Mr. Specht. On motion of Mr. Yale, Mr. Joseph Crockett, engineer and Superintendent of the S. F. Gaslight Co., was nominated for Treasurer, and the Secretary was instructed to cast a ballot for the candidate.

The following nominations for Directors were made: W. Hammond Hall, C. E.; Aug. J. Bowie, Jr., M. E.; George W. Percy, architect; E. J. Molera, electrician; F. Gutzkow, chemist and metallurgist; G. W. Diokie, mechanical engineer; J. Spiers, mechanical engineer; Patrick Noblo, mechanical engineer; Major Wm. A. Jones, military engineer; W. G. Curtis, railroad engineer.

The result of the ballot was that Messrs.

the Association becoming a branch of the Mechanics' Institute in some manner so as to have the benefit of the library. There was much diversity of opinion, but it was determined to keep an independent organization.

The Secretary was instructed to have the Constitution, by-laws and list of members printed, and a copy sent to each member.

A vote of thanks to the Mechanics' Institute for the use of its rooms was passed, and the meeting adjourned to the first Thursday in May, when active work will be commenced.

THE mining outlook for Utah is brighter than it has been for some time. Ophir and Stockton give promise of some life, while Bingham prospects are looming up big. Tintie, American Fork and Big Cottonwood districts will send down lots of ore this season.

MR. GEORGE McDOWELL is about to visit the different camps and towns in Amador and Calaveras counties, in the interest of the MINING AND SCIENTIFIC PRESS and other publications of Dewey & Co. We bespeak for him a cordial reception.

tools. In the matter of lubrication of the wearing surfaces, the distribution of oil is very complete, and improved devices for oiling the valves and piston have been introduced.

The wearing surfaces are not only ample for service required, but are provided with means of adjustment in the event of wear. They are constructed with the view of producing not only a strong and well-proportioned engine, but at the same time to give it a graceful outline, preserving, as far as possible, those curves which are pleasing to the eye, rather than the rigid outlines which are the result of connecting straight lines, yet not forgetting that though "the curved line is the line of beauty, the straight line is the line of duty."

The engine now in operation at the Joshua Hendy Machine Works has thirteen inches diameter of cylinder and twenty-four inches stroke of piston, and the agents invite an examination of its merits and the economy of its use: this form having been especially designed and adapted for electric lighting, flour, cotton and woolen mills, and all other purposes where perfect steadiness of motion, uniformity of action and the economical use of steam may be required.

DURING the past winter 87½ inches of rain fell in the Cajon Pass.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Siskiyou County Mines.

EDITORS PRESS:—As far as we can judge the future by the past and present, the season promises to be one of the most prosperous for the county. We anticipate good outside feed, good crops, and a good yield of filthy lucre from the mines. Nearly all the old mines promise well, while there will be a large area of new mining ground worked this season. The mining and stock outlook is especially good.

Perhaps a short sketch of some of our mining territory might be of some interest to your readers. The writer is not well enough informed regarding the mines of the whole county to give more than a very meager notice of them. I am engaged in this business on a small scale, though with good hopes and fair prospects of at least making "grub," especially as I raise all my "spuds," beans, corn and small vegetables, keep my chickens, milch cow and gun. The latter, in the provision line, is a host within itself.

There are small claims on every side of me. Two miles north are the French Creek quartz and placer mines, with a \$3,000 five-stamp quartz mill, arastra, long string of hydraulic pipe, etc. Cory's quartz claims were surveyed about two weeks ago, for the purpose of being patented. I would like to see these quartz claims (the French Creek) get into the hands of men that are able to prospect them. The present owners, Hartstrand, Cory, Root and Kingery, are all poor men, farmers and unable to develop the mines. Two miles east of these claims, Hartstrand, Bemis and Small have several locations that prospect well, which they are working with an arastra, lately started, though one ledge has been prospected for a number of years. Offield has a good prospect here too, and one small "seam" that is paying small wages. Hartstrand, Bemis and Small have a seam that prospects on an average \$1 per ton, so they tell me, but water is scarce there. John Bolongot or "French John" as he is generally known is piping in Squaw gulch, this claim has been worked a long time. He uses 1,500 feet of six inch pipe, and has a 50 foot bank. I can't tell how the claim pays. A mile above S. C. on the west bank of Scott river we come to the Porter Flat claim, owned and worked by a company of 11 Chinamen, with 2,200 feet of six inch pipe. They have a large amount of ground, and it is the writers opinion that they have made considerable money the last few years. A little above and on the opposite side of the river we see a claim owned by Macaulay & Welker. Only enough work has been done on this claim to hold it, though it prospects well. Just above bar, Horan and others have a claim, developed as extensively as the last. Next is the "Last Chance," owned by Denny, Pederson and several others; this was worked on a small scale last year and I think cleared expenses. The three last mentioned, by the outlay of a little capital, would undoubtedly pay big, and sometime they will be known as paying drifting claims. Here the east and south forks unite their waters. Adjoining the "Last Chance," up the south fork from the mouth we see the great "Montezuma Flume." This is one of the most complete in the county. It is a mile in length, four feet high and six wide. Putting in new blocks last year cost \$2,000. The Montezuma claim has paid at times well; \$1,700 in one day I am informed, though I never heard what it cleaned up last year. I am told that from first to last, Alex. Parker, the present owner, has expended \$65,000 and was offered \$75,000 for it last year, though I don't know how correct this is. It started up a short time since. Alongside and a little below or northeast is the Fortune claim, owned by Mitchell, Denny & Co. This claim has been worked four or five years. There are shares owned by four men. They took out \$8,000 last year, and had a short season on account of putting a new pump, new flume, moving, etc., etc. None of these claims are over five miles from my cabin ("Little old log cabin in the mountains"), of the south fork.

About other mines in this vicinity I will speak in the future. All the heavy drifting claims on the Klamath paid well last year. The Fort Jones took out \$20,000, though they had several break-downs, stoppages, etc. There are several large claims near this one of which I may have more to say at another time. At Oro Fino and Quartz Valley the outlook is particularly favorable. I may pay this section a visit soon and will then be better informed. I am satisfied there is a good field in this county for capitalists, both in the mines and stock farming interests.

R. D. NUNNALLY.

Bobs Cabin, Siskiyou Co., April 4, 1884.

BIG WORK FOR ONE MAN.—The Eureka Sentinel says: The prodigious energy of Martin Piantoni, one of our stoutest-hearted prospectors, is meeting with its just reward in the Dead Broke mine. Martin, unaided by partners or outside capital, has done an immense amount of work in his mine. The tunnel, drifts, winzes, shafts and general openings aggregate 4,000 feet. He has all of 2,000 tons of ore in the mine broken down and exposed.

Inventors' Memorial to Congress.

Address and Memorial to the Honorable Senate and House of Representatives of the United States in Congress Assembled:

We, the undersigned, Inventors, Manufacturers and other Citizens, interested in the progress of the useful Arts, and in favor of equal justice to all men under the Constitution, most respectfully, but urgently, petition your honorable body in respect to existing wrongs and threatened injustice to a most useful class of citizens.

From the very foundation of our Government, it has been its settled policy to secure a just reward to all inventors, and it is to the inflexible maintenance of this policy that we are indebted for the unparalleled advancement which we as people have made in the useful arts; all that is glorious in our past, or hopeful in our future, is indissolubly linked with that inventive genius which to-day enables us to pay higher wages, manufacture a better article, and sell it cheaper in the markets of the world than our competitors.

Most of the manufacturing business of our country is done under the authority of Letters Patent, which represent modern improvements, without which modern business could not be transacted. And the time has come when the inventors, who yearly add millions of wealth to the country, and the manufacturers who distribute this wealth, should receive the consideration they deserve.

The Patent Law, as it now stands, is, in some particulars, both unjust and ambiguous. Unjust, in that it punishes the Patentee for securing his rights abroad by restricting them at home; and ambiguous, in that it is susceptible to and has received different constructions by the Courts. Recent decisions have been to the effect that Patents not limited as required by section 4887 of the Revised Statutes, are void, and yet, owing to the difference between the Patent Laws in foreign countries and our own, it is impossible to tell when such limitation begins, or how long the term of the patent will be.

Grave doubts are entertained as to the legality of appropriating the Patent Fund for any purpose other than for which it was created; and we believe that no more insidious or successful scheme for breaking down our Patent System could be devised than that embodied in a bill, which recently passed the Senate, for providing an educational fund for certain States and Territories out of the surplus funds of the Patent Office. It never was intended that revenue to the Government should be obtained from the Patent Office; and the demand that an additional tax of one hundred and fifty dollars (\$150) be levied on every patent issued, as per Senate Bill No. 300, has no excuse, except in the cupidity of its projectors.

Not only are the fees now paid sufficient for all purposes, but the fact that a surplus of two million and a half dollars now stands to the credit of the Patent Office in the United States Treasury; and the other fact that more than two thousand patents were withheld during the past year for non payment of final dues, not only argue against additional fees, but show that greater liberality might be extended to inventors with good results.

The vindictive sentiment which for years has denounced the right of property in patents has found embodiment in one of the most unscrupulous and powerful combinations that ever existed in this country, and has not scrupled to invade the sanctity of our National Legislature, and there demand that our Patent Law be so changed as to render it a weapon of oppression against, rather than a protection to the inventor.

It is well known that House Bill No. 1612, and Senate Bill No. 300, originated with this combination, and were intended to assist in carrying out its principles, as set forth in the declaration of one of its representative members, viz: "When we see a good invention, we use it. Sometimes we are made to pay by the plucky inventors, but in the aggregate we pay less than if we had taken a License."

Complaint is constantly made of the inefficiency of the Patent Office, and great injury to inventors and annoyance to the public have resulted. This is not the fault of the Patent Officials, but arises from the neglect of Congress to appropriate enough of the Patent Fund to conduct the business of the office properly. It should not be forgotten that the increase of business in the Patent Office is without parallel in the world; the number of applications during the past year amounting to 35,000, and it appears that the increase of business has not been accompanied with a corresponding increase of the examining corps; hence the work of the office is largely in arrears and daily accumulating. The officials are daily compelled to inform applicants that weeks and even months may elapse before their cases can be reached.

The want of room and facilities for transacting the business of the office are such as would disgrace any private establishment in the country, and yet, a recent request from the Commissioner for additional help and room has been met with a reduction of the force then employed, and the appropriation of more room for the use of the Interior Department.

The Patent Building was erected for the exclusive use of the Patent Office, and was partly paid for out of the Patent Fund; but notwithstanding this, the Interior Department, with its numerous bureaus, has taken possession of and so crowded and cramped the Patent Office that

it has not half the room necessary for its use. In view then of the injustice herein set forth, your petitioners pray:—

First—That a special commission, including one or more parties of practical experience, be appointed to revise the Patent Law.

Second—That skilled persons be employed to make a digest of all the matter in the Library of the Patent Office, with abbreviations of all inventions, so arranged as to correspond with the classification in the Office, so that each examiner may have everything relating to his class, conveniently at hand.

Third—That foreign patents, or at least drawings of such, be duplicated and classified so as to afford a convenient reference.

Fourth—That the statute which limits the term of a home patent to that of the earliest expiring foreign one, be repealed.

Fifth—That the fee for granting patents shall not greatly exceed the expenses incurred.

Sixth—That the Patent Fund be forever sacred for the uses and purposes for which it was created.

Seventh—That the Patent Office Building be used exclusively for Patent Office purposes, and that so much of the surplus fund as may be necessary for the proper and prompt performance of its business be expended therefor.

Eighth—That the working forces be increased, and such salaries as will secure efficient service be provided.

Ninth—That in view of overtures made by foreign Governments, authority be given the President of the United States to conclude arrangements for the joinder of the United States in an International Union, for reciprocal protection of and legislation for patents.

Tenth—That a commission be established with authority to order such Patent Office expenditures, not in excess of receipts, as such commission may from time to time deem necessary.

Money Scarce at Cœur d'Alene.

In a recent number of the MINING AND SCIENTIFIC PRESS, was published an article specially urging all who were going to the new Idaho placers to provide themselves with as much ready money as possible, and if they could, to leave a small "stake" somewhere on which they could draw to carry them back. To be broke in a settled community or where ore is known is had enough, but when it comes to being out of money at a new and distant place like Cœur d'Alene, it will be found to be "hard times." Prices for all necessities of life are high at the new camp, transportation is expensive, and plenty of money is requisite to get along with any sort of comfort. The following article from the Cœur d'Alene Nugget will show the state of business matters in the new camp:

Money is being expended with lavish hands in the Cœur d'Alene mines. Town lots cost a goodly sum, to begin with; buildings cost enormously, more, in fact, than anyone could suppose, considering their appearance and character; goods cost so much in the way of freight, that the original valuation or purchase price is lost sight of entirely; and finally, all kinds of labor or help command high wages. Many a man comes here thinking he has a snug little capital, and before his "opening" day comes, is broke and in debt. Comparatively few of our business men have much capital left by the time they are ready to begin making money. Nearly all of the small business firms underestimated the cost of starting, and have little spare cash until they make it from the sale of goods. Of course there are exceptions, numbers of them.

There are men with great wealth and unlimited backing, but they, by no means, are in the majority. Men are getting rich, or at least doing well, who started for the mines with from \$500 to \$2,000. It is not an easy place to borrow, it one runs short of funds. No matter how good a man may be, there is use for all the surplus coin in camp, and men do not like to lend. Interest is no particular object, as investments are likely to double or treble capital in a day, and lending money is too slow a business in such a country. To all who contemplate coming here to invest in any kind of commercial pursuit, or who intend to start in any kind of business, our advice would be to bring money enough. Calculate just how much you may be called upon to pay out, and then multiply by two, and add to the product a few hundred dollars for contingencies. Of course you can start here on very small capital, many men managing to start on nothing, but it is perplexing business, and won't do to depend upon. The profits in any legitimate pursuit are enormous. Once established, a share of custom is all a man can ask to require a competency. A few months of present prices and present trade will send many a man out of the mines rich, whether there is gold dust on the bedrock in Pritchard creek or not. Nearly all kind of business is slightly overworked at present. Accommodations are not provided with a view to those who are now here, but to those who are coming. It is possible there may be a few days of stagnation about the time the trails are melting away into wagon roads. But it will last only a few days, and may not be noticeable. When the roads are passable, and men and freight can come in easily, there will be such a rush to this camp as will set all figures at defiance. Those who have been too tender to endure hardships, will pay those who have dragged goods over the trails and prepared ac-

commodations. Every day of fatigue and worry, every drop of sweat, every pang of self-denial and every sacrifice of comfort will be worth dollars; good hard dollars, and those who come into the mines at the later pleasant day, will not begrudge the dollars which the pioneers have so richly earned.

Mining Debris.

A gentleman in Placer county, in this State, writes to the State Mineralogist asking him whether the late debris decision will interfere with the working of the drift mines in that locality. The State Mineralogist quotes considerably from ancient writers and also describes the state of the river navigation in early days in this State. The gist of the answer, which is very long, is, however, summed up in the following conclusions:

1. The gold fields are not exhausted.
2. The question of slickens is far from being settled.
3. The miners and farmers have a common interest in the welfare of the State, and in the production of gold which is shared by the whole country in a lesser degree, and to a certain extent by the whole world.
4. The farmer cannot escape the effect of floods and the action of the elements even if hydraulic mining should be stopped.
5. The miner cannot collect gold without using and discoloring the water of the streams.
6. Decrease in the production of gold causes low prices and numerous inconveniences, which affect the farmer as well as the miner.
7. There are large tracts of land in California which can be used for agricultural purposes where no mining is likely to interfere.
8. The area upon which placer gold can be profitably mined is limited.
9. If it is wrong to mine by the hydraulic process in California, it is equally wrong to mine in Idaho, Colorado, New Mexico and in other States and Territories, and the general government entailed a serious hardship on many by specially encouraging mining, as it certainly has done.

I am of the opinion that a convention of miners and agriculturalists should be called to discuss this question and to devise plans to overcome the undisputed inconvenience and injury to the farmers caused by hydraulic mining. It is my present opinion that the general government should step in and aid in the settlement of this most important question, in which all the people are interested. The gold of California was an important factor in the hands of the Government during the time of sore adversity of the nation, and would be again under similar circumstances. The whole country should give this matter attention, for it is a national question. What takes place in California must follow in the course of time in other States and Territories, for which reason it is my opinion that the serious attention of Congress should be called to the subject by the people of California; and that body be asked to appoint a commission to investigate and suggest some relief for the troubles both of the miner and agriculturalist which have become very serious. Capital is alarmed, miners are discouraged, some of the most prominent have either left the State, or are preparing to do so. Other countries see the advantage of our system of mining, and will receive with open arms the skilled miners and artisans we are willing to spare. They are envious of the prosperity of California which we do not realize or sufficiently appreciate.

I have said more in this communication than was necessary to answer the question asked in your letter, but I consider it a duty to express my opinion, as it is the duty and privilege of all citizens, and I think the more the question is agitated the more fair and impartial will be the final settlement.

POOR CHANCE TO SELL MINES.—An experienced mining man writes from New York as follows: "The New York mining market is practically dead; there has not been a sale made in months. Everything was sent to London, and in London it is the same as it is here. An acquaintance advertised for mine to send to England; ninety were offered of which he selected one, and another party advertised and forty-five were offered of which he selected one. A broker said last week there has not been a bona fide sale of stock made at the mining exchange in six months. The Mining News, a few evenings since proposed that they close the exchange, and save the rent or merge it in the oil exchange, which, with its tributary bucket shops, are gambling marts. More mining offices are for rent here each week. It would appear to me as a waste of time for miners to come here to sell mines; the money expended in expenses had better be put in the mine. The same may be said of the other mountain States and Mexico. Denver should in the future be the mining center to distribute capital in the Sierra Madre mineral fields, and houses there make some practical arrangement to get capital from the Eastern cities. This could be done in the way of loans on mines and reduction work, as the mining business was carried on in Old Mexico, where money was loaned in Madrid and Genoa on mines, in preference to any other property. The old system here has come to an end, and much the same in Chicago."

MECHANICAL PROGRESS.

Steel.

Of all the metals at man's command, steel ranks among the most useful, if not most valuable; and human nature is presumed to possess some qualities resembling that of fine metal, as Skakspere says:

"O God of battles steel my soldier's hearts."

The earliest discovery or invention of steel was in the remote past, but the nature of the change in the iron was not understood. It was prepared by fusion, and not by cementation as in later days. Ordinary steel contains from 0.5 to 1.5 per cent of carbon. Its hardness and fusibility increases with the amount of carbon, and when this element is in excess it becomes cast-iron. When the proportion is small, the metal is termed mild, or low steel. An expert defines steel as an alloy of iron, which is cast while in a fluid state into a malleable ingot. Steel has been produced as an experiment by heating the iron to be converted in contact with diamond.

Steel was imported from the country of Chalybes, into Greece about 500 B. C. and the name Chalybes signifies steel. The description of steel-making by Aristotle shows that the process was repetitive, and that dross was eliminated. Heating several times in contact with charcoal was supposed to purify it. It was only lately that steel was understood to be a carburet of iron.

A crude steel is obtained by the finery process; namely, by removing the impurities of cast-iron by jets of air blown into the bath of molten metal which is covered by a layer of charcoal. The varieties of steel in modern use are very numerous, many of them having peculiar adaptation to a certain specific purpose in the arts.

The natural steel of Germany is made directly from the ore, and sometimes from pig-iron in the Catalan forge. The ore is smelted, as for iron, in blast furnaces, but the blast is weaker, and is directed, not upon the metal, but in a horizontal direction above it. The metal is kept covered with slag, or vitrified cinders, and is not disturbed by stirring. When the iron is judged to be sufficiently refined it is taken out and forged.

The steel in India is made by melting the crude, native iron, in crucibles, in which pieces of wood or leaves are introduced. It is called India steel, or wootz, and is valued as the material of edge tools. The name is often appropriated by English manufacturers for their own products, which are probably ordinary cast steel of good quality. The process of procuring this steel is primitive and laborious, but the Hindoo manages to obtain a most excellent steel.

In England, the Swedish iron is used for making the best steel, it is received in bars three inches wide and five-eighths of an inch thick, and about twelve feet long. The process is elaborate and while useful for some purposes is not considered to be best adapted for making tools for working wood or metal.

Cast-steel was invented in 1840 by Benjamin Huntsman, near Sheffield. His process was to place small fragments of blistered steel in a crucible of fine clay, place broken green glass above it, and lute the cover; that is, use a composition of clay for stopping the juncture of vessels so closely as to prevent the escape or entrance of air, and then place the crucible in a furnace. When melted it was withdrawn and poured into an iron mold. And this is essentially the process still followed in producing fine cast steel suitable for cutlery and tools for working wood or metal.

Various efforts have been made to produce cheap steel on a large scale. Of these the Bessemer method was most successful.

The Damascus steel is made from the natural ore by the same process as the wootz.

Yungsten steel is remarkable for its magnetic capacity. Yung is from the Swede and Danish, meaning heavy, and sten or stein is stone. It is a metal of grayish white color, and of considerable luster, brittle, and nearly as hard as steel, so that some difficulty is experienced in obtaining uniformity in the product. Its specific gravity is near 17.6, and sometimes, when heated to reduce in the open air, it will take fire.

In the sculptures at Thebes, butchers are represented sharpening their knives on a round bar of metal which is suspended from their girdles, and which are evidently of steel. It was for a long time supposed that steel or iron was unknown to the Egyptians, but this has been disproved by paintings and later discoveries, as some of the sickles are represented blue and others red, indicating the knowledge of both bronze and steel.

Steel is a most interesting study of metallurgy, and poets borrow it for comparisons upon every conceivable subject, and Wordsworth, speaking of water, remarks:

"These waters steeled
By breezeless air to smoothest polish."

Many a life lesson can be drawn from this valuable metal. To have our lives as flawless for slander to stripe our hearts as if they were incased in polished steel, and leave us untainted by its touch, and to be as true in our love as this shining steel, all this and more could be inferred from this useful gift of nature.

Transmission of Power by Shafts.

In his recent lectures on "Transmission of Energy," Prof. Osborne Reynolds said: "In a revolving shaft, neither the stress nor the velocity is uniform over the section, both varying uniformly from nothing in the middle to their greatest value on the outside; so that their mean product is exactly half the product of the greatest values. The greatest power per square unit of section a shaft can transmit is half the product of the greatest stress into the velocity at the outside of the shaft. Taking, then, the greatest safe working stress of steel at 15,000 pounds on the square inch, taking what is the greatest practical velocity at the surface ten feet per second, the speed of railway journals, the work transmitted is 75,000 foot-pounds per second per square inch of section, 135-horse power; so that we should have to have a shaft of upward of seven square inches in section to transmit 1,000-horse power; that is, a shaft of over three-inch diameter. The friction between such a shaft and lubricated bearings is well known—0.01; so that calculating the weight of the shaft twenty-four pounds per foot, we have power spent in friction about 52,000 foot-pounds per mile; that is, one-tenth the total power the shaft will transmit. That is, if we put 1,000-horse power into a three-inch shaft, making 500 revolutions per minute, we ought, at the end of a mile, to be able to take 900-horse power out of it. If we had to go farther the size of the shaft might be diminished, so that in the next mile we should again lose a tenth, and if we repeat this process seven times we shall, at the end of seven miles have left about half the original power put in. It will be thought, perhaps, that a three-inch shaft is very small to transmit so large a force; this is because the speed of 500 revolutions per minute is inconveniently high for purposes if employing the power; but if it were merely a question of transmission it would be about the best speed. This, then, shows the limit of the capacity of shafts as transmitters of work."

STEAMING AND BENDING WOOD.—In an address recently delivered by Mr. H. G. Shepard, of New Haven, Conn., relative to the use of wood in carriage making, he said that after a piece of wood is bent, its characteristics undergo a considerable change. The wood is heavier, and its fibres have become interlaced; it will sustain more pressure and strain than straight wood in the same directions, either across or with the grain. He said: A piece of timber that has been steamed, whether it is bent or not, has its stiffness increased. It is more brittle than it was before, and for some uses it will do as well, and yet there is a quality that the steaming process and the kiln-drying process affect in much the same way; they both cook the gum in the timber and make it brittle and stiff. There is a kind of hickory that never becomes stiff by a natural process of drying, and one of the desirable qualities of a spoke, rim, or whiffletree is stiffness as well as strength. You take that hickory—and it is the very best we have—and steam it, and it is better fitted for these purposes than it was before. It is difficult to tear apart a piece of bent wood; the fibres are interwoven, one with the other. We do not perceive the change on the outside, but when we come to split the stick open we find that its character is entirely changed. Apropos to the above, a correspondent of the *Scientific American* asks in regard to drying wood with superheated steam: Can it be successfully done? Would it be as likely to check as when dried with hot air? What is the better plan of superheating steam? That journal answers as follows: Superheated steam may enable you to make a hotter drying room. We do not know that it has many advantages and is liable to cause trouble. Eighty pounds boiler pressure with sufficient pipe will enable you to boil the sap out of the wood. The best way to prevent checking is to heat the wood in steam for a short time or until the wood gets thoroughly heated through, and then ventilate slowly, keeping up the heat in the dry room.

PIPES MADE OF STEEL PLATES.—Pipes made of steel plate are coming into use in England for the conveyance of water under high pressure. The plates are coated with lead on both sides by immersion or otherwise, then rolled to form, riveted, soldered the whole length, and covered with pitch. Of this method it is said the first cost of the steel is not much greater than that of iron, and the steel pipes possess considerable advantages over those of iron; the lead coating is superior on account of the fineness of grain in the steel, and the strength of the pipe is much greater.—*Exchange.*

FOUR-SIDED DRIVING BELTS made of ropes are reported as the latest invention pertaining to the milling industry in England. They are made in sections and screwed together in such a manner that the connection offers no resistance to the pulley. The inventors claim that this form of driving belt is more durable and stronger than leather belts. Their relative value, as far as ropes are concerned, is not mentioned, which seems to be a rather suspicious neglect of the principal point.

CAR WHEELS.—There are said to be 10,000,000 car wheels running in this country, and that there are no less than twenty-seven distinct "diseases," so to speak, which a car wheel is liable to contract in the course of its manufacture.

SCIENTIFIC PROGRESS.

Progress in Electric Discovery.

Several announcements of remarkable discoveries in the electric field of science have quite recently been announced: The *London Times* of a recent date informs us that a new electrical contrivance had been perfected by Mr. A. St. George, the inventor of the telephone which bears his name. This invention, which is really supplemental to the telephone, will enable every description of conversation carried on through the instrument to be not only recorded, but reproduced at any future time. Briefly stated, Mr. St. George's invention may be thus described: A circular plate of glass is coated with collodion and made sensitive as a photographic plate. This is placed in a dark box, in which is a slide to admit a ray of light. In front of the glass is a telephone diaphragm, which, by its vibrations, opens and closes a small shutter through which a beam of light is constantly passing and imprinting a dark line on the glass. Vibrations of the shutter cause the dark line to vary in thickness according to the tones of the voice. The glass plate is revolved by clock-work, and the conversation as it leaves the telephone is recorded on the sensitive plate, the imprinted words spoken being fixed as is done in photography. The plate can be brought forward afterwards, and when replaced in the machine and connected with a distant telephone, will, when set in motion, give back the original conversation.

Invisible Wire.

Platinum wire has been drawn down so fine by Mr. H. F. Read, of Brooklyn, as to be invisible to the naked eye, although its presence upon a perfectly white card could be detected by the touch and could be seen with the aid of a small magnifying glass when the card was held in such a position that the wire cast a shadow.

A small platinum wire, about No. 18, was inclosed in a close fitting tube of silver. The tube was made by taking a long and narrow sheet of silver, about one-twentieth of an inch thick, folding it over into a cylinder, and drawing down until the wire would just fit in it. This was then drawn down until the tube containing the wire was only as large as the original wire. A short length of this was cut off and incased in a second tube of silver, which was drawn down in the same way. This operation was repeated until the platinum wire had been reduced sufficiently in diameter. The last wire was drawn as fine as the dies would permit, when the silver coating was removed by an acid. During the work it was necessary occasionally to anneal the wire.

The resulting wire was in short lengths and had no strength. It was designed to be used for the cross wires in telescopes, its perfect opaqueness and fineness rendering it particularly applicable, but its extreme weakness made its handling almost an impossibility.

THE COLOR OF SUNLIGHT.—Since the time of Newton it has been assumed that all the radiations of the sun were to be found in the spectrum, and that these reunited make white light. There is also a tacit assumption that white light is pure sunlight. Some of the early experiments at Alleghany have been mentioned which showed that the light as we receive it has been somewhat altered by the sun's atmosphere. The change is an absorption of rays from the blue end of the spectrum. It follows that our sunlight is more red and less blue, and far less intense than it would be if the solar atmosphere did not intervene. But we are concerned with something nearer home. Our own atmosphere repeats the performance, strangles many rays at the blue end of the spectrum, and comparatively few at the red end. What does this mean? Let us shake hands with our friend who wears green goggles. We, too, have all our lives seen things in a false light. If we could place ourselves outside of our atmosphere—say on the moon—we should find that sunlight is not white; that the sun itself is really blue. To the inhabitants of "other worlds than ours" the sun may be a bluer star than Vega.—*Harper's Magazine.*

THE LATEST BOSTON NOTION.—It is rumored, says a Boston paper, that a syndicate representing over \$100,000,000 has been formed for the purpose of developing and introducing an invention which is said to combine the usefulness of the telegraph and telephone with that of the electric light. The plans of the company, for some unexplained reason, are kept very dark, and the possibilities of the invention are somewhat indefinite; enough so to challenge doubt of the reality of the whole thing, if the claims put forward by those who talk about it were not so positive and evidently serious. One gentleman, who said he was not at liberty to state the names of the inventors or to go into particulars at present, said: "The electric light will soon be a thing of the past. The disk is an electric apparatus, and by it we, in the night time, can receive sunlight, from any point on the earth where the sun is shining. Don't be incredulous, my friend, sunlight has already been transmitted to a dark room over a wire; I have seen it myself." Then, too, scenes of any kind, in action or repose, however distant, which can be focused on the disk at the transmitting end of the wire, are registered with

photographic accuracy on the disk at the delivery end. These particulars are all given, with more or less positiveness, by other persons who seemed able and willing to talk about the invention. None of the parties interviewed, however, would give the inventor's name or localize the invention in any way, except by saying that "it originated in Boston."

ATMOSPHERIC WAVES PRODUCED BY VOLCANIC ACTION.—Professor Soester, director of the observatory of Berlin, and others, have remarked the existence of sudden barometric changes in calm, steady weather occurring during the month of August last, and have traced their connection with the eruption of Krakatoa on August 27th. The chief shock of this eruption was felt about 7 A. M. on that day, and the resulting atmospheric wave appears to have traveled over the world. The first wave was felt at Berlin about 10 hours later, giving a velocity of propagation of 1,000 kilometers per hour, or nearly the speed of sound. About sixteen hours later a second disturbance was felt, probably due to the wave which did not come direct, but around the other side of the world, by America. For the same speed of propagation the time would correspond to the distance in this case. Moreover, thirty-six hours after the first disturbance at Berlin, a third was felt of a weaker sort, and this corresponds again in point of speed. Lastly, a fourth and weaker disturbance was observed thirty-four hours after the second wave, the acceleration in this case being due, perhaps to atmospheric currents from east to west.

THE SYNCHRONOUS TELEGRAPH SYSTEM A REALLY MARVELOUS INVENTION.—In the opinion of the eminent electrician, Professor Houston, the practicability of the synchronous multiplex telegraph system is entirely assured. He expresses the opinion that we are on the eve of a revolution in telegraphy as marvelous, if possible, as that which introduced the telegraphic system. The synchronous multiplex system is absolutely a departure. The division into circuits is based on the simultaneous rotation of two cylinders, or disks, as they may be termed, one at each end of a line; a single wire constituting the main line is thus connected simultaneously, at both ends, with corresponding operating instruments, and it is transferred from one instrument to another so rapidly that the operator or sender does not realize that the line has been disconnected from one instrument to another, since each operator has always the line at his disposal, even at the highest rate of manipulation. Recently seventy-two distinct and separate circuits have been operated on the same line. Either the Morse or printing system may be used.

FORMS OF COMETS' TAILS.—Th. Schwedoff has shown that comets' tails may be represented by waves, produced by the passage of the nucleus through a resisting medium. His theory has the advantage of dispensing with the assumption of any doubtful agencies, and of predicting the form and position of the tail in any comet of which the elements are known. Faye has endeavored to demonstrate that the hypothesis of an interplanetary resisting medium would require a mass, within the limits of our system, a hundred thousand times as great as that of the sun, even if the density of the medium were only 1-2,000 as great as that of our atmosphere. He supposed, however, that the ethereal density does not vary between the surface of the sun and the orbit of Neptune. If we admit, with Encke, that the density of the cosmic medium decreases in inverse ratio to the square of the distance, we readily find, for the total mass of the medium, a value which is only one thirteen millionth part as great as Faye assumes.

PHOTOGRAPHING SOUND VIBRATIONS.—Recent experiments have shown that the photographing of sound vibrations is a practical success. A small thin platinum plate was attached, perpendicularly, to a thin iron plate, which, as in the telephone or phonograph, was fixed on a wall piece and vibrated to sound. With a solar microscope an image of the platinum plate was focused on a screen, after which a prepared photographic plate was quickly moved across in the plane of the screen, by a strong spring, while the mouthpiece was spoken to. A bounding line between light and shadow was thus obtained on the prepared plate, forming a curve closely corresponding to the sonorous vibrations—simple curves for vowels, complicated ones for consonants.

THE height and velocity of clouds have been determined in England by means of photography. Two cameras placed about 600 feet apart were provided with instantaneous shutters, simultaneously relieved by electricity. The observer measures the angle of inclination of the cameras at the position of the cloud as photographed on the two plates, and from these data a trigonometric calculation gives the distance and height of a cloud with great accuracy.

RAPID PROGRESS.—The first line of telegraph was erected less than forty years ago, and at the present time there are more than 1,000,000 miles in operation. The United States comes first, with 250,000 miles, with the immediate probability of adding another 100,000 miles; Germany comes next with 150,000 miles, and the Great Chinese Empire last, with 1,200 miles.

Dakota Mines.

The Lawrence County Mining Region.

This county lies in the southwestern portion of the Territory, and is bounded north by the north fork of the Cheyenne or Belle Fourche river, east by the south fork of the Cheyenne, south by Pennington county, and west by Wyoming Territory. Its principal creeks and tributaries to the Cheyenne are Spear Fish, Whitewood, Bear Butte, Alkali and Elk. The engraving shows the geographical features. The western portion, within the limestone belt of the country, is divided into the mining districts of Whitewood, Bald Mountain, Deadwood, Greenwood, Galena, New Carbonate or New York, Spruce and Two Bits, and also contains a part or Rockford district.

The Whitewood District

Comprises the group of mines known as the Gold Belt, on which the Homestake, Deadwood, Terra, Father De Smet and others are situated. Extending from the belt mines in a north-western direction are wide blanket veins of cement, rich in gold. These veins follow the slate for bedrock, and are capped by porphyry rock. Through them run numerous channels, like the beds of

ancient streams, along which this cement, a conglomerate of quartz, pebbles and other rock, is often found in beds from 15 to 20 feet in thickness. One large channel, on which the Lancaster Company is working, is seen in the hill between Deadwood creek and Black Tail creek, and seems to have come from the vicinity of De Smet. All the hillsides below the porphyry line are covered with float cement, which in the gulches below is mixed with gravel, decreasing in quantity as the stream descends. Similar cement conglomerate is found in Pennington county. The mines of the Homestake group have been constantly worked. The ore is handled economically, and thus permits a profitable treatment of low-grade ores with satisfactory results. A body of paying ore reported to be at least 100 feet long by 70 feet wide, and 100 feet deep, in an open cut between the Highland and Homestake mines, was, after the necessary precaution to guard against accident and destruction of property, thrown down at a single shot. The ore, amounting to thousands of tons, was thus economically broken up, a greater part ready for the shovels, and requiring but a few shots in the boulders too heavy to load upon the cars. From the De Smet mine, belonging to the same company, ore has been extracted and milled at the rate of from 200 to 400 tons a day.

The gross product of the belt mines according to the United States Mint Director's report was, up to July 31, 1882, equal to \$13,434,116. Average of 1,512,037 tons, or \$8 78 per ton.

The Caledonia shows two distinct veins, or lodes, about 95 feet apart, one called the Discovery and the other the Caledonia. The mine has been opened by a cut 150 by 100 feet on the east side, and 800 feet of tunnel on the west.

The Durango mine is located about half a mile west of the Homestake mine, on the north side of Main street, Lead City. The mine is nothing but a wash, which here for a distance of about 200 feet long by 20 feet wide has accumulated in pockets of a gold-bearing cement.

There is no sign of a vertical vein in the tunnel run, and the bed rock is as zigzagged as forked lightning. Wherever this bed-rock pitches can be found gold, and here was where miners were led to believe a true vein had been found. It only took about 6 feet of digging to

convince them of the fallacy of the idea. As the tunnel was run to the north it encountered a hill, and barren rock was struck. This is easily explained: The miners had got beyond the pocket, where, at some period in the past, the gold had been accumulated by a running stream.

Near the Cheyenne Consolidated are located the Grant, Conway, Financial, Anchor, Moose, Aleck, Grand Deposit, Baltic, Brigham, Corinne, Utah, Laramie and numerous other locations which have been worked to a greater or less extent, under great disadvantages, but the work has developed the fact that the whole hill is a mass of gold-bearing rock, assaying \$6 per ton.

Galena, or Bear Butte District.

Located on Bear Butte creek and its tributaries, is the oldest silver-mining district in the Black Hills. Systematic work was commenced in 1879, but has since been developed with great energy. The production of silver bullion during the year 1882 was reported at \$232,400 in silver, and \$650 in gold. At the Oro Fino mine, under the charge of Superintendent Van Sycle, the company have worked twenty-eight men, seventeen (including the superintendent) at

shafts averaging 100 feet in depth, and tunnels of 50 feet.

Bald Mountain District.

This district comprises an extensive silver belt, on which operations were retarded during the summer on account of the scarcity of water. A project is under way to construct a narrow-gauge railroad down Grant canyon to the reduction works in the district. The Portland Mining company made developments on several ledges showing large bodies of silver ore carrying some gold and considerable lead. They have erected a mill and chlorination works having a daily capacity of 30 tons, and have recently purchased the Trojan group of mines, and expect to produce large quantities of bullion. The company's 20-stamp pan mill was dependent for matter upon springs having their sources on the property of the company, which are found by actual experience to furnish an amount sufficient for experimental works during the season. An ineffectual attempt was made to collect bed-rock water by running drifts. In

Carbonate District.

About eight miles west of Deadwood, very extensive veins of carbonate have recently been

The People's Food.

While all sorts of commissioners and officers are created and appointed to mitigate evils or cure abuses, the frauds committed on a long suffering people in the matter of food adulterations seem to be continued without official rebuke. Being something that is everybody's business, no one attends to it. In this city we have an official who sees after meat which is unfit for food, but as people's noses in that matter are generally good indicators, this can be guarded against with little trouble.

It is in connection with the substances which are adulterated with deleterious articles that supervision is most necessary. The people unconsciously take into their systems substances of a positively hurtful nature in consuming the ordinary foods which they buy in the stores.

It would seem as if our National or State legislators might turn aside from mere politics once in a while, and give attention to the subject of foods of the people. A means might surely be devised by which the adulterations could be detected and a remedy applied. If people pay for flour, milk, butter, etc., they ought to be entitled to flour, milk and butter, and not mere

imitations. But the people, as a whole, are not chemists, and are not able to detect the wrong from the right. Government, State or Municipal officers might be detailed to perform these duties. The mere passing of laws will do no good. Provisions for enforcement must be made, and besides that, good, heavy, exemplary fines for breaking the laws should be enforced. We have no suggestion to make as to how this should be done; but that some check to the wholesale adulteration now going on should be commenced is perfectly apparent to all. Tea made principally of willow leaves and coloring matter coffee, mixed with beans and chic-

MAP SHOWING THE LOCATION OF THE RICHEST OF THE BLACK HILLS DISTRICTS.

the mine, seven at the mill, and four hauling and cutting timber. The vein lies north, and ore has been taken from a shaft less than 50 feet deep. The width of the ledge is claimed to be about forty-five feet. Red Cloud mine is now the property of the Fort Meade Mining Company. Twenty wagon-loads of base bullion, worth, including lead, \$56,000, were taken from a ten day's run of the Sitting Bull smelter, in March. The Sitting Bull mine produced considerable bullion, which was shipped by cars from the mine to its 30-ton smelter. Fifteen thousand ounces of silver bullion milled from low-grade ores were taken from the mine, and 100 tons of base bullion were produced, which contained, besides lead, 46,000 ounces of silver and a small quantity of gold. A ten day's run in March gave 80,000 pounds of base bullion worth \$8,000. Besides the ores treated by the smelter, considerable milling ore was taken out and reduced at the Florence stamp mill.

Greenwood District

Is situated on Box Elder creek, in the central portion of the hills. The streams occupying this belt are the Deadwood, the Black Tail and the Hidden Treasure creeks, flowing in a north-westerly direction through blanket veins of cement or conglomerate rich in gold. The ore found in this district is mostly chloritic slate, containing free gold and lying in large bodies. It can be milled at a nominal cost, and is about the same grade as that in the other parts of the hills. Wood and water are abundant, and can be utilized at little expense. Box Elder creek carries water enough to run 6000 stamps, and the hills on the other side are covered with an abundance of pine. The mines in this district have thus far been but slightly developed by

discovered, showing ore of a high grade and producing as high as from 500 to 1,000 ounces of silver, and from 60 to 80 per cent of lead. These mines have not been producing in great quantities, but are being rapidly developed, and will soon be among the valuable producing mines of this region. A large number of ledges have been discovered, on which developments have been made, and from present indications this camp is likely to become prominent in the Black Hills.

Two Bit District

Is a gulch near Spruce gulch, in the neighborhood of Deadwood City. The ores are of high grade, containing some silver. The principal locations are on almost horizontal ledges. The head of the gulch is no doubt bordering on the galena silver belt, as float of galena, rich in silver, is found deposited in its crevices. The ores of Spruce gulch, which are milled at Deadwood, about half a mile from Deadwood City, are of a high grade, but are not found in such large masses as in the Homestake belt. The veins are supposed to have been formed by sedimentary deposits, of which there appear to be two beds, one lying about 100 feet below the other. The Oro Cache, Anna and Ophir are located in this gulch on the lower vein.

The "Van Campen Compound" is the name of a new explosive, claimed to be more powerful than nitro-glycerine and perfectly safe. It is intended for railroad work, quarry work, coal, iron, copper ore, stump and boulder blasting. Mr. M. Ayres, of Oakland, the general agent on this coast, says you can cut it in pieces, stamp it on the ground, set it on fire and burn it up, and there will be no explosion.

core; flour spoiled with plaster of Paris and chalk; honey made up of glucose, syrup, etc., and butter made of lard, soap-fat, dead horses, and no one knows what else, and yeast powders filled with deleterious substances, are among the commoner things we have to put up with. Cottonseed oil represents the olive; pepper is only half pepper, horse radish is made out of turnips, and mustard only half its strength, are examples among the minor evils. In nearly every department the people suffer by paying for adulterated substances.

The vigorous steps being taken by some of the New York papers to find out the true inwardness of the oleomargarine manufacture, is doing much good in that direction. Should some great metropolitan journal undertake the thorough expose of this question of food adulteration it would redound greatly to its glory, and be productive of greater benefits than any North Pole expedition, African exploration project, or even full verbatim reports of any of our great social scandals. The source of the Nile will not interest so many as the means of obtaining pure foods; and the northwest passage is of less importance to the millions than the possibility of getting good milk and butter for every-day use. It may be that this object will one day become one of the important planks in what are known as party platforms. It certainly is of much more importance to the people than the mere abstract questions which often occupy our law-makers' time. The people should be protected from adulterated substances. They should have pure food and be sure to get what they pay for and not its mere semblance. The subject is of the highest importance to all.

The Leaching Process.

[CONTINUED FROM LAST WEEK.]

Furnace Loss.

We have:

55,167 pounds fine silver in the roasted pulp, being 17,519 pounds of pulp, assaying 0.3149 per cent.
62,400 pounds fine silver was contained in the raw pulp.

7,233 pounds fine silver = 11.6 per cent is the apparent loss.

During the roasting of these ores the draught was kept very sluggish, and the pulp was purposely not raked in the sixth hearth. On dropping the ore into that hearth and on shoveling and raking it in the other hearths considerable dust was evolved, which passed into our main flues.

Our flues are 7' high by 5' wide, and are only cleaned out once a year. They can only be cleaned out after the furnaces have been shut down several days. It was, therefore, out of the question to have them cleaned for this experiment.

We took great precautions to have the hearths very thoroughly scraped after the last charge of these ores passed through. Our own ores following the last charges of the experimental ores were tined by the latter; part of this was from the hearths and corners, and part dust from working the ores antecedent ones.

The first two *hacienda* charges, 1,500 pounds each, which followed the experimental ores, assayed 139 milles and 137 milles, the ores of the former in all the other furnaces during that day only assaying 70 milles. This accounts for 2,040 pounds of the silver lost in roasting the experimental ores, reducing the loss to 5,193 pounds. This figure will show a roasting loss of 8.3 per centum.

The next four or five charges of *hacienda* ores were still tinged with the characteristic color of the ores of the experiment. They assayed 80 milles and 77 milles, the *hacienda* ores pure only assaying 70 milles. The ores were roasted in a furnace which had not been stopped for two years, the bottom of which is somewhat uneven.

With well-constructed dust and condensation chambers, and with what is more important still, long and spacious flues, the roasting loss in these ores will be very light if the firing is done intelligently. They need very little fire.

Fifty pounds were taken from the roasted pulp while still hot; they were not included in the above weights; they would very slightly lessen the loss shown, leaving it 8 per cent.

Tests of the Roast.

Chlorine assays from the whole pile, forty-eight hours after the ores had lain moist in a vat, are as follows:

No. 1.—Buttons from 300-grain samples, boiled with concentrated sodium hyposulphite, gave .046 grains; original sample assayed 315 milles = 95.1 per cent chlorinized.

No. 2 gave buttons of .052 and .046 grains; original sample assayed 323 milles = 94.9 per cent chlorinized.

No. 3 gave buttons of .048 and .054 grains; original sample assayed 315 milles = 94.6 per cent chlorinized.

After the first four or five charges were roasted, 50 pounds were placed in a small vat and treated with our ordinary working solution, 2° B.

The tailings assayed:

18 milles = 5.25 ounces per ton of 2,000 pounds.

After forty-eight hours further leaching the tailings assayed:

15 milles = 4.33 ounces per ton.

18 " 5.25 " "

The cloth in the bottom of the vat did not filter freely.

Leaching.

The amount served to the vat was:

17,519 pounds, as before stated.
50 pounds were taken for assay samples—25 on first weighing; 25 on second.

17,469
1,342 pounds, residue from Pilot Charge No. 2 (viz. 1,402 pounds, less 7.5 per cent moisture) were added.

18,811 pounds, total served to vat.

Silver Content.

55,010 pounds fine silver, being 17,169 pounds ore, assaying 0.3149 per cent.

2,187 pounds silver in residue in Pilot No. 2, being 1,342 pounds ore, by 0.163 per cent (mean of four assays, 166, 168, 164, 163 milles).

57,197 pounds pure silver being total content.

Check samples were taken from top of vat, to ascertain progress without emptying the vat:

Fifth day—22 milles = 6.4 ounces per ton.

" " 22 " 0.4 " "

Sixth " 19 " 5.5 " "

" " 17 " 5 " "

The roasted pulp was placed in a vat with a perforated false bottom covered with *manta* (unbleached cotton cloth). Another cloth was spread over the ore and covered with poor tailings. The latter precaution was taken to keep out ore-dust and to filter from the working solution a very small quantity of silver sulphide, which is nearly always suspended in it.

The usual bottom is a layer of broken slag with a layer of jig-tailings on top of it. The result of using the two cloths was that a stream of only say $\frac{1}{3}$ diameter issued from the spout instead of a full stream of $1\frac{1}{2}$; i. e., the filtration was slow. Moreover only one small precipitating tank was used, and the stream, small as it was, was often interrupted. The (filtration) leaching, instead of being completed in four days, took rather more than a week. The first leaching with spring water was suppressed.

The silver precipitate obtained was filtered and afterwards dried four days on sheet-iron plates, over a very small fire. It was then

passed through a 6×6 sieve, and weighed 291 pounds avoirdupois.

Six samples were then taken and portions at once weighed for assay. The reason for weighing for assay without loss of time was that the little remaining moisture might be exactly the same in the assay portions as in the main lot.

The assay results were 18.791 per cent, 18.857 per cent, 18.923 per cent, 18.906 per cent, 18.877 per cent, 18.767 per cent.

We have, therefore, 291 pounds precipitate, assaying 18.852 per cent = 54.859 pounds pure silver. The silver contained in the roasted pulp which entered the vat was 57.197 pounds, and of this we obtained 95.91 per cent. The loss was 2.338 pounds of silver = 4.09 per cent. Judging by the check samples of tailings which have so far been withdrawn from vat, this result appears slightly high.

For the purpose of ascertaining the ley (finesness) of this precipitate as it would enter the cupelling furnace, after being partially roasted in a reverberatory, a small portion was roasted without stirring, in a shallow dish, the residue assayed 26.032 per cent silver. There will be very little expense in refining this substance; the German cupelling furnace will probably be found more suitable than the English one for this purpose.

When our roasters become acquainted with the ore they will be able to use much less salt, and the first leaching for removing soluble salts of base metals can be used. Of late we connect a piece of hose to the water-pipe and allow some three feet of its extremity to lie on the slag, the vat being then filled with ore. As water enters, some is allowed to escape through the spout. In this way the water least saturated with common salt flows away first, and the more saturated portions, on their descent, are diluted, depositing the silver chloride in the ore. It will be remembered that silver chloride is soluble in a strong solution of common salt, but is precipitated on diluting that solution. After washing a few hours in this manner, the excess of the salt is removed, the hose is then pulled away, and the wash completed by allowing the water to enter on top.

Besides the points of detail referred to in the first leaching, there are certain points of management in the second leaching (that with calcium hyposulphite) which also conduce to great economy of material and to close extraction of silver in a very marked degree.

The samples taken from the whole pile of tailings, after discharging the large vat, assayed:

18 milles = 5.2 ounces per ton of 2,000 pounds.
18 " 5.3 " " "
19 " 5.4 " " "
18 " 5.3 " " "
18 " 5.2 " " "
18 " 5.3 " " "
18 " 5.2 " " "
17 " 5.0 " " "
18 " 5.2 " " "
19 " 5.4 " " "
Average, 18 " 5.3 " " "

They were twice weighed:

First weight, 23,395 pounds.
Deduct, 6,387 " = (27.3 per cent moisture).

17,008 "
Second weight, 23,335 pounds.
Deduct, 6,554 " = (23.8 per cent moisture).

17,781 "

We have, consequently, 17,394 pounds of tailings, assaying 0.018 per cent, which gives a silver content of 3.131 pounds, and the pure silver which entered the vat being 57,197 pounds, we have a loss of 5.47 per cent, and this corresponds moderately well with the 4.09 per cent, which was shown by calculating the pure silver contained in the precipitate obtained.

[CONTINUED NEXT WEEK.]

SNAKE RIVER PLACERS.—There is at present some excitement on Snake river over the success of a saving machine introduced by Eastern capitalists, by which the flour gold of that extensive region can be saved and procured in very profitable quantities. It has for many years been a well-known fact in this Territory that the vast gravel bed lying south of the Shoshone falls for over fifty miles contains large quantities of exceedingly light flake gold. In fact, this gold is so light that no ordinary process, as repeated trial has shown, will catch enough of it to pay the expense of operations. The bars are very extensive, and generally lie at different elevations, or on from one to three table-lands bordering the river. The ground has been believed by many to be the richest in the country, but the only test of this has been by very careful prospecting. Sometime last year the attention of Eastern men was attracted thither, and through their interest a machine was introduced late in the fall that made a comparative success, but did not excite general approval until the addition of certain improvements completed its success, and now it is said that eight-tenths of the gold can be saved, and the operation is very practicable. Three large companies of Eastern capitalists have incorporated to work the Snake river gravel beds, and are buying up everything that cannot locate. Many old timers have been doing annual assessment work in that region for several years, and are now offered good sums for their ground. One claim sold two weeks ago for \$27,000, and a portion of another for \$2,500. The ground is very extensive, and should this speculation succeed, and it is probable, the Snake River valley will, in a short time, be the most active, the most extensive, and the most permanent scene of placer mining in Idaho. The resource is exhaustless.—*Ketchum Keystone.*

Foreign Localities of Nickel Ore.

Sweden.

Nickeliferous magnetic pyrites is found abundantly in Sweden, but in general is too poor in the metal to pay for working. The principal works for the extraction of nickel are at Klefra, in Jonkoping (Smaland), and of Sagmyra, in Dalecarlie. The product is an alloy of nickel and copper. The product of 1876 amounted to 790 quintals of nickel speiss, 1,035 quintals of concentrated matte, and 220 quintals of nickel of high grade.

There is also an establishment for the manufacture of cobalt—the Gladhammars Grufve-Aktiebolag (the Gladhammar Mining Company). The mines yielding cobalt ore containing nickel are near the city of Vasterrik, and have been worked since the commencement of the sixteenth century for iron and copper, but since the beginning of the present century for cobalt. The richest ores, containing 10 per cent and over of cobalt, are exported, while the lower grades have recently been treated by smelting for enrichment. The production of rich ore in 1876 amounted to 287 tons, exported chiefly to England, and 1,042 tons of poor ore.

In 1878 this company employed 16 workmen; wages from 2 francs 10 centimes to 2 francs 80 centimes per day. They are lodged gratuitously in houses constructed by the company. The taxes for the year amounted to 160 francs (about \$30).

Saxony.

The clay slate and micaceous district near Schenberg contains over 150 lodes, yielding nickel, cobalt, bismuth and arsenic with a zone six miles in length and about two miles in width. The mines and works date from 1642, and employed in 1873 1,200 miners and smelters.

New Caledonia.

A very important discovery of high grade ore of nickel was made shortly before the International Exhibition in 1876, in the French penal colony of Nonneue. This ore, as found near the sea coast, is chiefly silicate, of the oxide of nickel, free from arsenic, cobalt, or other injurious elements. It is easily worked by the wet or dry methods, and is known as *noumeite* or *garnerite*. The percentage of nickel is variable.

According to Messrs. Christofle and Bonillet the ores from New Caledonia as they reached Europe, in 1876, contained on an average 18 percent of protoxide of nickel, and had the following average composition:

Water.....	22
Silica.....	38
Peroxide of iron.....	38
Protoxide of nickel.....	18
Magnesia.....	16
	100
The same authorities gave at the same time an analysis of the metallic nickel obtained from these ores by the wet method and fusion:	
Nickel.....	97.75
Silicium.....	.54
Carbon.....	1.25
Manganese.....	.30
	99.90

The New Caledonia mines are owned chiefly by a French company, and are worked at a small cost, in part by convict labor. Being near the coast, the ores can be conveniently shipped and cheaply transported to any part of the world. It is fair to assume, however, that like most oxidized ores, they are most abundant at and for a short distance below the surface; and that during the first few years of working the mineral will probably be yielded more rapidly and cheaply than it can be obtained afterwards.

The influence of the ores from the New Caledonia is already felt in the nickel markets, not alone in cheapening the production of nickel and nickel salts and alloys, but also in the improvement of the quality of the alloys of nickel, making them more ductile, tractable, and in every way superior to the alloys made from impure nickel. The use of these clean ores dates from 1876. The ores were shown in great abundance at the International Exhibition at Paris, together with many examples of the greatly improved alloys derived from them. The composition varied greatly, ranging from a few per cent of nickel to 20 per cent. There was for a time an over-supply, ship-loads arriving at the French and British ports faster than required. The ore was already largely used at Christofle's new establishment. He early perceived the great advantages which this new docile ore from the French penal colony offered. He enlarged his works and in reality erected new works on a grand scale at St. Denis, near Paris, and generously invited the members of the international jury to inspect them. This establishment then had a capacity of production of 400 kilograms of nickel daily, say 240,000 pounds annually, but were producing only half of that quantity. Both the wet and dry methods are employed. The richest selected and washed ore is melted direct with carbonate of soda in crucibles, giving metallic nickel, which is granulated in water. The wet process consists in digesting the ore with acids, precipitating the iron first and then the nickel as oxide, which is washed, dried, reduced to sponge, and finally fused with copper to make copper bronze for use in making German silver. This firm had in 1878 a large stock of New Caledonia ore stored away, about 2,000 tons of 10 per cent ore, valued at 500,000 francs.

Spain.

An ore resembling that from New Caledonia is reported by M. Meissonnier to exist in the

province of Malaga, Spain. It is said to carry 8.96 per cent of nickel and no cobalt. It is referred to the species *pinelite*.

New South Wales.

Nickel ores do not appear to be abundant in New South Wales. Professor Liversidge reports a massive variety of copper—nickel of a copper-red color partly incrustated with pale green nickel hydrate, from near Bathurst. Some has also been found on the Peel river.

Copper.

It is nearly a year since Lake copper took a sudden downward plunge, and the reports now coming in rapidly show what business the leading companies did in 1883. To a certain extent it will be possible to arrive at an opinion whether and to what extent the great enterprises on the Lake are capable of facing the competition of the world. In this discussion it will be necessary to exclude entirely the great Calumet & Hecla Company, which produces approximately one-half of the entire quantity of copper on the Lake, at a cost so low that there is not to our knowledge a single concern in the world which can deliver so pure a material at so low a figure. The other mines, in the aggregate, make up the other half of the product—seven mines, the Quincy, Osceola, Franklin, Atlantic, Allouez, Pewabic and Central, each of which makes more than 1,000,000 pounds, turning out together over 21,000,000 pounds. The Quincy mine shipped, in 1883, 6,012,239 pounds of refined copper, against 5,665,796 pounds in 1882, at a gross cost of \$540,038.27 and \$541,407.58 respectively. The cost of production was, therefore, almost exactly 9 cents a pound, as against 9.55 cents in 1882 and 10.03 cents in 1881. Its net earnings, it is true, fell off from \$441,553.85 in 1882 to \$296,031.11 in 1883. The Osceola, in 1882, produced 4,176,782 pounds of ingot at a cost very close to 13 cents, paying \$250,000 dividends in that year. In 1883 it turned out about 4,260,157 pounds of copper, and reduced its dividends to one-half. The Franklin, in 1883, did much better in the way of output than in 1882, turning out about 4,304,615 pounds of ingot last year against 3,264,120 in 1882, when the average cost was 13 cents per pound. It is probable, therefore, that it is in much better shape now than it has been. In 1881 the cost per ton of rock hoisted, including construction account, was \$2.32 for ore yielding 1.42 per cent mineral; in 1882 the figures were \$2.35 and 1.68 respectively; and in 1883, \$2.40 and 1.71 per cent respectively. The reports of the Atlantic and the Central are not yet at hand. Both of them, however, maintained their output, both paid dividends, and both, in 1882, turned out their copper at less than 15 cents. The Allouez produced in 1883 1,751,377 pounds of refined copper, which realized \$265,066, or an average of 15.13 cents per pound, against 17.86 in 1882. The cost, including working expenses at the mine, freight, smelting, and cost of marketing, was \$279,921.44, or 15.98 cents per pound. The Allouez has therefore lost money in 1883, in spite of the fact that the networking expenses per ton of rock mined have been reduced from \$2,2426 in 1882 to \$1,9951 in 1883, the yield of the rock mined having been respectively 0.746 and 0.725 per cent of copper only. The Directors of the company have naturally taken the only step possible under the circumstances looking to a reduction of the cost, that of increasing the facilities for production, and an assessment of \$40,000 has been called for to enlarge the capacity of the stamp-mill by one half and provide for facilities to increase the output of the mine. It is accordingly putting in a third Ball head. The Pewabic, the weakest of the large companies, sold during the year 1883 1,239,740 pounds of copper at an average price of 15.912 cents, realizing \$197,262.36. The agent reports the cost of opening, \$51,179.35, the cost of stoping \$40,774.68, and the cost of treating 57,677 tons of rock stamped at \$52,980.60, a total of \$144,934.63. The agent's drafts were \$240,060.53, and \$19,199.53 were expended for smelting and freight, and \$6,863.74 for brokerage, copper expenses, etc. At the annual meeting this week, it was decided to sell the property for not less than \$50,000, and reorganize under the laws of Michigan. The Huron produced, in 1883, 720,210 pounds of copper from 1.74 per cent rock, at a total expense of \$226,888.98, much of which we presume is due to construction account. The mine is equipped with a second head of stamps, and it is believed that, with a yield of from 125 to 130 tons per month, it can live at present prices. The reports of the younger companies, such as the Conglomerate, Wolverine, Peninsula, and Belt, are not at hand; but they have become or are just about to become large producers, and even should their expectations not be realized, the heavy outlay of capital in their equipment will probably make them heavy producers for years.

Generally speaking, the indications are, that the hard times of low prices are causing a substantial reduction in the cost of production on Lake Superior mines, and that their effect will be presumably rather an increase than a decline in the aggregate product. Any rise in values which the first improvement in business must bring with it, would find the Lake copper mining companies splendidly equipped, and in a position to add largely to their net revenues.

Engineering and Mining Journal.

ENGINEERING NOTES.

THE ST. LAWRENCE TUNNEL.—Mr. J. B. Rouillard, of Montreal, Canada, has been awarded the contract for the St. Lawrence tunnel. The contract provides that the work shall be in condition for the running of trains within three years from its commencement, and Mr. Rouillard is positive that the whole will be finished by June, 1885. Preliminary preparations have already been made, and in a few weeks the working plans will be drawn up. The tunnel is to be about 16,000 feet long, 26 feet wide and 23 feet high, and will contain a double track. The greatest depth will be at the middle, where the rails will be about 76 feet below the level of the bank, the gradient from each side to the middle being less than 105 feet to the mile. The tunnel, according to contract, will be complete in every respect. A permanent system of ventilation and drainage will be established and the electric light used. The immense amount of machinery which will be required will be obtained as far as possible from English and Canadian manufacturers. When the work is in full swing, Mr. Rouillard expects to have some 500 men employed. The price to be paid for the tunnel complete is \$3,905,000. The syndicate, of which Mr. Rouillard is the representative, is composed of nine gentlemen of various nationalities—Canadian, English and Scotch. Mr. Rouillard himself has considerable experience in this sort of work, having been the constructor of several tunnels in the Rocky Mountains.

RAILROADS IN VENEZUELA.—The first railroad built and operated in Venezuela began at Puerto Cabello and led to the westward. About ten miles were built and operated, but enhancement followed, and nothing is now to be seen except a dim outline of the roadbed. About the year 1870 an English company built a two-foot gauge road from Tucacas to the mines of Aroa, a distance of 55½ miles. Poisonous reptiles; wild animals, malaria, and dense jungles combined to obstruct the building of the road. The largest bridge has a span of 90 feet. The ties, bridges, and even the telegraph poles are of iron. The road for its last five miles has a grade of 600 feet, requiring specially constructed engines. The freight cars carry from five to six tons and the passenger cars about 30 passengers. A road from La Guira to Caracas, a distance of 22 miles, has been in process of construction for several years. The track of the road is 3½-foot gauge. It is built on a series of reverse curves having a radius of 140 feet. Surveys have been made for other lines, and a small amount of grading has been done on a road 40 miles long from Puerto Cabello to Valencia.

POWER AND SPEED OF TORPEDO BOATS.—The power required to propel torpedo boats of different sizes is far from constant at all speeds. It happens that Messrs. Jarrold & Co., of England recently had under trial two torpedo boats of different sizes, and as the results may be of interest to our readers, we annex the following facts: The larger boat was 100 feet in length and 12 feet 6 inches broad, having a displacement of 40 tons. The smaller one was 86 feet in length and 11 feet broad, having a displacement of 33 tons. To drive the 40-ton boat 15 knots required 248 indicated horse-power; 33-ton boat 15 knots required 277 indicated horse-power; 40-ton boat 18 knots required 394 indicated horse-power; 33-ton boat 18 knots required 390 indicated horse-power; 40-ton boat 21 knots required 540 indicated horse-power; 33-ton boat 21 knots required 510 indicated horse-power.

NOVEL CURE FOR NOISY BRIDGES.—The Osnabruck Steel Works have recently been manufacturing steel rails eighty-eight feet six inches long, which have been laid down on railroad bridges crossing the City of Hanover, Germany. It was found that the noise caused by passing trains was becoming such a nuisance that a remedy had become a necessity. The cause of it was the violent vibrations at the rail joints, and the engineers hit upon the expedient of having the rails made long enough to cover the whole length of the bridges. Since they were laid down the nuisance caused by the rail joints has ceased. The use of rails of the length stated is, as far as we know, without a parallel in the history of railway construction, and reflects credit alike on the engineers who suggested it and the manufacturers who made them.

FILLING THE SAHARA.—A correspondent of the *Scientific American* has made some calculation on how long it would take to fill the Sahara with water from the Mediterranean Sea. He finds that it would require 4,000 years for the water from the Mediterranean to fill the Valley of the Jordan, which is 1,000 feet below the former, the water to flow through a passage 100 feet wide by 20 feet deep, with a velocity of four miles an hour. With a channel 100 times this capacity it is possible, he says, to limit the period of filling to 40 years. At the same rate it would take 40,000 years to fill up the Caspian Sea to the sea level, and thousands of years to fill up the Sahara.

The Thames is about to have a second tunnel. The Severn resents the attempt at a tunnel by periodically flooding out and drowning the operators; the Mersey tunnel is rapidly becoming a fact, and the projectors of the Huer tunnel promise success.

USEFUL INFORMATION.

Strength of Consolidated Paper.

It is quite remarkable the solidity and strength into which a mass of consolidated paper can be pressed. Paper car wheels are composed entirely of paper rings pressed together under a weight of six tons, and then fastened by means of bolts, and steel tires put on them; then they are ready for use. Laid loosely the rings stack as high as the shoulders of an ordinary man. Under treatment they sink to the thickness required. If the tire should wear or fall off the wheel, or the train run from the track, there would be no danger of their breaking, as they are very flexible and would spring.

A paper ball can be rendered so solid that nothing but a diamond tool can cause an indentation into it. At the mill is a square block of compressed paper fastened on a turning lathe and so hard that if a fine steel chisel is held against it when it is moving, instead of cutting the paper it will break the chisel into a hundred pieces.

The strength is astonishing. You can take a 45 note of the Bank of England, twist it into a kind of rope, suspend 339 pounds upon one end of it, and not injure it in the slightest degree.

Bath-tubs and pots are formed by compressing the paper made out of linen fibers and annealed—that is, painted with a composition which becomes a part thereof and is fire-proof. The tubs last indefinitely, never leak, and put in fire will not burn up. You can beat on them with a hammer and not injure them.

Plates compressed and annealed are very durable. You can not only wash them, but drop them upon the floor and stand upon them. The fork can be used for many practical purposes, and the knife can always be kept sharp.

Paper can be substituted for wood, converted into picture frames and colored like walnut, cherry and the like. Bedsteads are fashioned the same as car wheels, only of long strips instead of rings. They are very beautiful and lasting. Cooking or heating stoves are also annealed, and it is impossible to burn them out. They are less costly than iron. A house can literally be constructed of and furnished with every convenience in paper.

OIL FOR WAGON WHEELS.—A practical man says: "I have a wagon of which, six years ago, the felloes shrunk so that the tires became loose. I gave it a good coat of hot oil, and every year since it has had a coat of oil or paint, sometimes both. The tires are tight yet, and they have not been set for eight or nine years. Many farmers think that as soon as wagon felloes begin to shrink they must go at once to a blacksmith shop and get the tire set. Instead of doing that, which is often a damage to the wheels, causing them to dish, if they will get some linseed oil and heat it boiling hot and give the felloes all the oil they can take, it will fill them up to their usual size and tighten to keep them from shrinking, and also to keep out the water. If you do not wish to go to the trouble of mixing paint, you can heat the oil and tie a rag to a stick and swab them over as long as they will take oil. A brush is more convenient to use; but a swab will answer if you do not wish to buy a brush. It is quite a saving of time and money to look after the wood-work on farm machinery. Alternate wetting and drying injures and causes the best wood to decay, and lose its strength unless kept well painted. It pays to keep a little oil on hand to oil fork-handles, rakes, neckyokes, whiffletrees, and any of the small tools on the farm that are more or less exposed."

CHEAP TELEGRAPHY.—In Great Britain a telegram of twenty words, with the address, can be sent to any part of the Kingdom for one shilling, about twenty-five cents of our money. On the Continent, where the governments have control of the telegraph, the rates are much cheaper. In Belgium and Switzerland, for instance, there are half-franc telegrams—that is something less than ten cents of our money—while in Paris the telegraph system is supplemented by pneumatic tubes carrying post-cards for half a franc. The English Government paid ten million pounds for what was worth commercially not more than seven millions; yet so great has been the increase of business, due to government control, that the shilling rate is soon to be reduced. The address will, as heretofore, be free, twelve cents will be charged for six words, eighteen cents for twelve words, and twenty-five cents, as now, for twenty words. Telegraphing in this country is under corporate control, and we are charged more than any other country on earth.—*Demorest's Monthly.*

COMPOSITION FOR CLEANING MARBLE SURFACES.—An improvement in liquid compounds for cleaning marble surfaces was recently made and patented by Mr. R. F. Dickson, of Atoka, Tenn. This is a cheap and simple liquid chemical compound which can be readily applied and effectually accomplishes the purpose. The compound comprises muriatic acid and clear ammonia, in proportions known to the patentee, which is applied with a stiff brush to the surface to be cleansed, after which it is washed off with water and a sponge, the operation to be repeated should the first application fail to entirely effect the purpose. This compound will be found useful for cleansing any marble, especially weather-heaten tombstones, or any article discolored by exposure and age. Being com-

posed of only two ingredients, it is manufactured readily and at small cost, and requires no skill or special preparation to apply it to the object to be cleansed.

WHAT WILL BURST A GUN.—Some strangely twisted pieces of gun barrels exhibit, in a most interesting fashion, says the *Philadelphia Times*, the vagaries of overtasked gun barrels. The specimens are part of some guns burst by Capt. Heath, of that city, during some protracted experiments with various weapons. Five of the barrels were burst because a ball was "stuck" near the muzzle in each case, two gave way because about four inches of snow was put in the muzzle, two were burst by reason of having some wet sand at the muzzle, and three were ruptured by mud at the muzzle. Sportsmen often scoop up a little mud or sand unconsciously, bang away at game, and are then astonished to find the gun with a ragged and shortened barrel.

AN EASY TEST FOR LUBRICANTS.—The manager of any mill may, at very little expense, determine for himself all the conditions of safety and economy in lubricants as indicated by the standard of heat developed upon any given shaft. The apparatus required for this purpose is merely a thin brass tube closed at the lower end, and two thermometers. The method of using this apparatus is as follows: Place enough water in one of these tubes so that the bulb of the thermometer will be immersed; insert the tube in one of the holes in the cap or the journal, so that the lower end of the tube will be in actual contact with the shaft, hang the other thermometer free alongside, then gauge the relative heat developed with oils and with greases. Each man may thus satisfy himself as to which is best and safest.

SMOKE CONSUMPTION IN LONDON.—Nearly 2,000,000 tons less of coal were consumed in London last year than in the year preceding, and this in spite of increase of population and the severity of the weather. This great reduction in fuel is ascribed chiefly to the anti-smoke question, which has led to the invention and adoption of the best sort of fireplaces. London, as well as New York, Philadelphia and some other large cities, have always been wasteful in respect to fuel. New York ash-carts carry every week from some of the houses of their wealthy people as much coal as would supply a Parisian family with fire for the whole week.

FOR CLEANING BUCKSKIN.—Make a solution of weak soda and warm water, rub plenty of soft soap into the leather, and let it remain in soak for two hours, then rub well until quite clean. Rinse thoroughly in a weak solution of soda and yellow soap in warm water, but not in water only, else it dries hard. After rinsing, wring it well in a rough towel and dry quickly; then pull it about and crush it well until soft.

SAND AND WATER.—The average depth of the ocean is 13,000 feet; and the average elevation of the land 1,000 feet; therefore the total volume of water in the sea is thirty-six times that of the land above the sea.

GOOD HEALTH.

Electrical Medication.

The subject of electric medication is attracting considerable attention at the present time, both from the medical faculty and from the public at large. An edition enlarged and reviewed by Dr. Tipton of Dr. Clark's work upon the subject has recently been issued to meet the increased demand for information in this direction. The author of this work, while not assuming a belligerent attitude toward the other members of the profession, is not afraid to speak out in a manly, independent spirit. He divides all diseases into two classes electrically, "those forms of diseases in which the vital force may be said to be too active, and those in which the vital action is too weak." His "philosophy of disease and cure" is based upon this principle. Yet, while he desires to give full scope to electricity as a remedial agent, he does not ignore the claims of drug therapeutics as an efficient ally, but places them side by side upon an equal footing.

The claims of electricity as a remedial agent was not formerly admitted by the profession, but of late, however, the researches of Dr. Tipton and a few others have placed it in a more favorable light, and many believe that ere another decade has passed the profession generally will acknowledge that in electricity they have found a most important aid to drug therapeutics in controlling most of the ills that flesh is heir to.

Still another new work on electricity in medicine and surgery has recently been made by Dr. Geo. C. Britner, of St. Louis, which purports to be a practical exposition of the principles of electricity as applied to medicine and surgery. The physiological effects of local and general faradization is discussed under the head of electro-therapeutics. The author says in this relation: "Electricity is simply force, and, like other therapeutic measures, must be rightly applied if we expect to accomplish much good with it. To be sure, a mere novice may relieve and cure people with electricity, knowing but little about what is doing, but this is

accidental, and such ignorant practitioners are liable to do as much harm as good."

TEA AND COFFEE.—Fowler & Wells, of New York, have just issued a little duodecimo volume of 120 pages, on "Tea and Coffee: Their Physical, Intellectual and Moral Effects on the Human System." The work was written and published many years ago by Dr. William A. Alcott, and is now republished with notes and additions by Nelson Sizer. This work, when first published, did much to call attention to the effects of the use of these beverages, and in the present form many additional facts are brought out by the increased knowledge which has been gained since the original publication. Part first opens with the history of tea, showing its exhilarating properties, when it was introduced, the amount consumed, and its increase. It is shown to be a medicinal substance, and to have the effect of a powerful drug; also that it is a poison, and produces a tendency to disease. The origin of the use of coffee is also given, with its effect both on the body and the mind. It is shown that some suffer more from the use of it than others. It is the opinion of eminent authority that even a moderate use of these articles produces diseased conditions, and we would recommend those who are using either of the above articles with the thought that they are not harmed, and also those who have not acquired the habit, to procure this little work and read what is said on the subject. The publishers will send it on receipt of price, 25 cents, in postage stamps.

FRESH PAINT.—The current belief among householders that the smell of fresh paint is noxious is founded on pretty general experience, but is opposed by the belief, equally current among chemists, that lead compounds are not volatile. A fact recently brought to our notice seems to support the domestic theory. The basis of the useful and popular luminous paint is known to be sulphide of calcium. Now, this compound, when unprotected by varnish, glass, or some other equally impervious substance, is slowly acted on by the acids of the air, and sulphureted hydrogen is evolved, which blackens lead paint. This is well known, and can easily be avoided by proper protection of the paint. But the curious thing is that unprotected luminous paint is found to be perceptibly blackened by the fumes from fresh lead paint. There seems to be only one possible explanation of this; namely, that a surface freshly covered with lead paint does actually emit some volatile compound of lead. We believe that many physicians could confirm this view from their own observations in regard to newly painted houses.—*Lancet.*

NEWLY BAKED BREAD INDIGESTIBLE.—A French chemist asserts that it is the mechanical state which makes new bread less digestible than old. The former is so soft, elastic and glutinous in its parts that ordinary mastication fails to reduce it to a sufficiently digestible condition. In the course of some experiments in this direction, a circular loaf, twelve inches in diameter and six inches thick, was taken from an oven heated to 240 degrees Reaumur, and a thermometer forced into it three inches. The thermometer indicated 207.5 degrees Fahr. The loaf was then taken to a room, the temperature of which was 66 degrees, and in thirty-six hours it had fallen to 63.5 degrees. In the first forty-eight hours it lost only two ounces in weight. After six days the loaf was again put in the oven, and when the thermometer had indicated that its temperature had risen to 156 degrees Fahr., it was cut open and found to be fresh, and to possess the same qualities as it had been taken out of the oven the first time, but it had lost twelve ounces in weight. Experiments were made with slices of bread with similar results.

SLEEPLESSNESS.—The proximate cause of sleeplessness is plethora of the cerebral blood vessels, and a palliative cure can be effected by anything that lessens the tendency of the circulation toward the head. But a permanent cure may require time and patience. By night studies brain workers sometimes contract chronic insomnia in that worst form which finds relief only in the stupor of a low fever, alternating with consecutive days of nervous headache. Reforming toppers often have to undergo the same ordeal, before the deranged nervous system can be restored to its normal condition. Fresh air, especially of a low temperature, pedestrian exercise, and an aperient diet, are the best natural remedies. Under no circumstances should sleeplessness be overcome by narcotics. An opium torpor cannot fulfill the functions of refreshing sleep; we might as well benumb the patient by a whack on the skull.—[Dr. Oswald, in *Popular Science Monthly.*]

RAILWAY DOCTORS.—On the State railways in Sweden there is generally a doctor for every thirty-two miles of line, and in this way forty-four doctors are employed by the government. The private railways have a similar system. The medical men examine all applicants for employment and reject those physically disqualified, especially by defects of sight or hearing. They also give their services to and attend to all injured by accidents on the line, to regular employees and their families in sickness, to occasional employees while engaged in service, and to laborers in the shops who have paid the same contributions as those engaged in working the line, and also to their families. No exception is made in the case of those who suffer from injury or disease caused by their own fault.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE OUTLOOK.—Amador *Sentinel*, April 4: The outlook for mining this year seems very favorable, more so than in any previous year. The rains have rendered it possible to work a number of hydraulic mines that have long been idle or but indifferently worked, and new discoveries of quartz come regularly to hand. The last payment on the \$2,600 bond of the St. Julian was made Monday. The principal amount of money to make these payments has come, we presume, from the mine itself. The mill is now at work on the rock which has been picked over and the bonanza ore selected therefrom. This refuse we are informed pays \$12 per ton, which is more encouraging for a permanent mine than all the rich pockets that may be discovered. All damage has been repaired at the tunnel works in Volcano, and two giants are at work on the gravel beds, the signs pointing to a favorable cleanup. On Aqueduct flat two giants are constantly at work. Messrs. Perry & Co. have struck rich ore in their claim below Pokerville. Various improvements are making in and around the Pacific and Empire mines of Plymouth. Gravel mining on Shake Ridge is progressing finely. More hydraulic mining is in progress in this county at the present time than for several years, the rains which have fallen so plentifully have enabled the working of gravel beds on which no operations have been conducted for some time. These claims are, however, all small in extent and the valley denizens need not fear an overdose of slickens. The Bunker Hill mine at its last cleanup obtained a larger amount of bullion than at any previous cleaning of the batteries—between \$12,000 and \$13,000. Samuel Stewart is prospecting in two places on the Lincoln ground. The work of clearing the Mahoney of water is progressing favorably. J. T. Wheeler has secured the lease of J. Ham to the Modoc mine, in Pioneer district, and is now engaged in working the same. Good pay rock has been struck at the Tellurium mine, Pine Grove.

VOLCANO NEWS.—Amador *Dispatch*, April 12: The times in this vicinity have not materially changed in the way of enterprise. The Downs mine is in operation with a full force of men. The mill is running day and night. Gillick & Phillips are getting out rich rock. They struck another ledge running parallel with the original ledge. It carries free gold. They have struck good rock in the Tellurium also. The mill is running day and night. The Pioneer mines are not doing much. The Tunnel Company have finished their flume and are now ready for action.

ST. JULIAN.—Amador *Ledger*, April 12: The little one-stamp mill at this claim is speaking very encouragingly. A cleanup of a week's run, comprising about 25 tons of rock, was made last Sunday, which turned out \$800 in free gold. The sulphurets will bring the total up to something like \$1,000; an average of \$40 per ton. The previous run on a mixture of slate and quartz, surrendered at the rate of \$15 per ton. The mill is now running on quartz stoped from the end of the tunnel, and seems to be paying equally as well. The ore-body has widened to 18 inches, and plenty in sight to keep the mill going for some time. Sinking the winze to get below the pocket has had to be discontinued for the present, on account of the abundance of water.

SOUTH SPRING HILL.—The mill will be shut down temporarily at the end of this week, on account of having to repair the shaft timbers. Some of them are breaking and if not repaired now, might cause considerable damage. The mine is looking as well as ever.

MISCELLANEOUS.—The header of the big tunnel at Middle Bar is in bunches of quartz, with a strong body of water, indicating a near approach to the ledge. At the Zeile mine arrangements are in progress to move the air-compressor from the mine to the mill, and the rock-breaker from the mill to the mine.

Calaveras.

MURPHY'S.—Calaveras *Citizen*, April 12: Mining in this vicinity has been inactive, owing to a great measure to the extreme bad weather until within the past week. The Oro Plata stamp mill has started up again, and if fair weather continues will be kept running continuously on screenings from the Company's hydraulic works. The new tunnel to tap the large deposit of ore is now in 130 ft. and it is expected that the men at work in it with the ore from other levels will soon be able to keep a larger number of stamps running. George Hengin has struck a good thing within a mile and a half of the Calaveras mine. The lode is from three to five ft wide and assays from \$10 to \$30 per ton. Good reports are given of the Calaveras mine, and the Barleigh is still being pushed on to rich deposits that will in the near future give a good account of itself. It is reported that a sale has been made of the Briston mine, a property belonging to Mr. Webeluth, to San Francisco parties, who intend to go to work at once on the mine. This mine is located within two miles of Murphys, on San Domingo creek, near the Fair Play.

El Dorado.

SEAM.—Georgetown *Gazette*, April 4: Alex. Connell has started up his old seam claim north of town. Alex. is persevering as ever, and don't propose to lay down his pick until he gets what he is after. Work was begun on the ditch to convey water to the Revenge mine on Coloma canyon near Greenwood, about 2200 ft of 11 inch pipe will be used in crossing the canyon. It is the intention of Supt. Dixon to start up the mill early in June.

Mariposa.

COULTERVILLE.—Cor. Mariposa *Herald*, April 11: The mines in this vicinity are booming. Charley Mast, Supt. of the Banderita, says that mine is all right, and that the public may expect cheering results therefrom at an early date. Splendid rock is being taken out. Reports from Mr. Lindsey, Supt. of the Virginia mine, show that this property is looking well. The vein in the upper tunnel shows free gold, generally diffused throughout the whole vein, which is quite large. In the lower tunnel, which is a

continuation of Coe's working, a fair size vein has been struck, which is increasing in size as they go, and is showing considerable free gold. As soon as the mine is fairly open, the ten-stamp mill will be started up, which is standing ready for operations. Mr. Douglass, Supt. of the Cook property, keeps a few men at work on this immense estate. An application has been made to the proper court for permission to sell Dan Cook's interest, and until such an order is made, nothing of any consequence will be done. These mines should be worked, and not be allowed to stand idle as they have for a number of years. A party of mining men spent two days at the Compromise mine recently, and the supposition here is that this property has changed hands. Some very rich copper mines have recently been located on White's gulch, south of Coulterville.

CATHEY'S VALLEY.—Mariposa *Herald*, April 11: Cyrus Thompson has leased the quartz mill belonging to C. Dickinson, and is crushing rock from the Johnson mine. About a year ago 30 tons of rock from this mine was crushed that averaged \$22 30 per ton.

DELTZ MINE.—Cor. Mariposa *Gazette*, April 12: We have lately been washing off the surface and exposing more of the large body of ore in the south side of the hill. There are a great many quartz stratas with casings which resemble coffee grounds, and is washed through the flumes; and the more the mine is worked the better it looks. During the late storm a landslide occurred on the north side of the hill and covered up the new shaft, which, fortunately, was protected with timbers so that no material damage was done. We had already washed up through the flumes the casing and dirt bearing gold taken from this shaft, and the fine quartz which undergoes the process of washing is taken out and thrown into a pile for milling purposes. There are some 600 or 700 tons of quartz in this pile already for milling, some of which was taken out of the mine at an early day by Ellis and others. There are, besides, several hundred tons of coarse or larger quartz which we have not moved from the dumps. The ore on the north side of the hill is considered to have already yielded its \$15 to \$20 a ton by washing, and is yet to mill. There are several hundred tons on the south side of the same sort. The old car tunnel and upper works caved in and the mine has never been worked below the spring water, and there are more than 100,000 tons of ore and vein matter now in sight, which can be profitably worked with water conveyed to the mine in pipes, the line of which has been surveyed. The mine is in excellent condition for more extended operations, and is now ready for a company to take hold and put through a tunnel from the north side—distance, 1,500 ft. and under top of the hill about 400 or 500 ft.

Mono.

MORE STAMPS.—Homer Mining *Index*, April 12: Rumors are afloat that Lundy is to have 35 stamps going the coming season, instead of ten, as heretofore—five additional stamps for the May Lundy group (to be put in as soon as lumber can be had), ten for the Gorilla and ten for the Clifton group. May Lundy, Lucky Morton and Lake View can easily be made to yield an ample supply of ore for fifteen stamps—40 to 50 tons per day; Gorilla can more than supply ten stamps, and the Clifton has in sight a large vein of high grade ore.

BODIE CON.—Free Press, April 15: During the week ending April 12th there were crushed at the Bodie Con. mill 138 tons of ore, and at the Bodie Tunnel mill 304 tons. The average assay value of the pulp is \$49.52, and that of the tailings \$3.60 per ton. At the mine the south drift from the west crosscut, 200-foot level has reached a distance of 25 ft, a gain of 10 ft. Here they expect shortly to make a connection with upraise No. 1 on the Fortuna. On the 200-foot level winze No. 2 has made connection with upraise from 300-foot level. On the 300-foot level upraise No. 1 has been advanced 8 feet; total height 170 feet, without any material change. South drift on the 300-foot level, Fortuna vein, is extended 7 feet; total length 205 feet, with no change. West crosscut from north drift, 300-foot level, has cut the Fortuna vein, which had faulted to the west. The vein is about 12 inches wide, low grade ore. They have started an upraise at this point to prospect the ledge above. North upraise on the 400-ft level has been advanced five ft; total height, 109 ft. The vein is about 3 ft wide but much broken.

Nevada.

LOOKING WELL.—Nevada *Herald*, April 8: Cap. Fleming informs us that his quartz mine which is worked through a tunnel running from Deer creek up under Broad street, is at present looking well and the prospects are most flattering. A three foot ledge has been encountered, from which two men took out 30 tons of ore in eight days. By working back toward the creek, considerable good rock can be taken out that was left untouched while driving the tunnel ahead, but as long as the ledge continues to look as it does now, Fleming says there will be no necessity of drifting into the back ground, it being much easier to take the rock from the regular ledge than from the stringers and chutes that have been passed by. Some rich sulphurets rock has lately been found in this mine and the quality of the ore generally is very fair. The owners contemplate the erection of a mill at no distant day.

ACTIVITY IN DRIFT MINING.—Nevada *Transcript*, April 11: There is renewed activity in drift mining in this and Little York township. Near the Cooper Bros. new saw mill some very good drift diggings are being worked, and prospects in several claims which have just been started up promise good results. The Pioneer Company, of which John Linderman is the principal owner, continues to pay handsomely. This claim has been worked for the past three years, and upwards of \$30,000 has been realized. The gold is very coarse, varying in size from a bit to over \$100 chunks. The largest nugget taken out was worth \$169, and several pieces were valued at from \$20 to \$84. The channel the Pioneer is now working on is from 40 to 60 ft wide. Seth Martin and F. A. Staples have a claim at Mt. Oro, on Greenhorn creek, about a mile from the Cooper mill. They have been running a tunnel, which is now in a distance of 450 ft. Last Monday they struck the rim of a fine body of gravel, and out of two pans of dirt they found several pieces of gold, showing that they had reached the channel. Work will now be pushed and Seth and his partner, F. A. Staples, will soon be on top of the "heap." On Deer creek, below Cooper's saw mill the Red Diamond Company have struck good gravel, but it is being worked

on a small scale. There are several other companies in that vicinity engaged in prospecting and before long we expect to be able to record richer strikes than have heretofore been made. That section of our country will yet show up largely in drift mining claims.

Plumas.

GREEN MOUNTAIN.—Greenville *Bulletin*, April 12: Some delay has been caused in starting the Green Mountain mill by a change of plan in building a track from tunnel No. 6 to the mill. At first it was determined to build only a temporary track, and some work had already been done, when from further advancement of work in the mine, it was resolved to change the plan, tear down what had already been done, and rebuild in a more substantial way. Heavy timbers were then got out, and a permanent road made on very strong trestle work from the dump at the mouth of the tunnel to the mill. This work is now almost completed, and the mill will certainly be started by the end of this week, or beginning of next.

San Bernardino.

PROVIDENCE.—Cor. Calico *Print*, April 12: We found the Bonanza King in full blast, 110 men on its pay-roll. To the new-comer the camp must present a decidedly "broken down" appearance, for the debris of burnt buildings, of others left half completed and falling to decay, would naturally convey that impression. However, a closer inspection into its affairs, corrects this and brings one to a conclusion the opposite. The ore teams passing loaded to the eaves with good average ore, and the continual rattle at the lower town where it is crushed are signs of prosperity, patent to all. We visited the other day the claim of R. P. Kerr, the Perseverance, located 2,000 ft north of the Bonanza claim. Mr. Kerr, has as fine a body of ore in sight as we have seen in many a day. In character it resembles that of the Company's mine. Mr. Kerr's vein is about eight ft in width, and is good milling ore throughout. Our impression, after several days spent in search of information relative to the mines about here is, that Providence is good for many a day yet, and it is our belief that the mineral resources of the district lack very much of full development.

CALICO DISTRICT.—Calico *Print*, April 12: Work is progressing on the Invincible mine on the surface. Small quantities of ore are being taken out daily, and several lodes have been milled recently. The last lot milled \$68 to the ton.

RED JACKET.—Mr. A. Barber has leased that portion of the Red Jacket mine not in litigation. The agreement entered into between himself and the owners is that he is to have three months in which to prospect the mine, without paying for the privilege, in case the mine does not show up well at the end of that time. If the result of his prospecting proves satisfactory to him he will continue operations under a two-year's lease, including the three months prospecting. Mr. Robt. Dougherty has been employed as superintendent, and the work of prospecting has commenced in earnest. Dr. Ghiselin is negotiating for the Geneva group of mines, about a half a mile east of Calico. He has paid part of the money down, and it is expected the sale will be completed soon, when active operations will be commenced to develop these mines. Work still progressing on the Kearsage mine, with favorable results. Two tons of first class ore, that sampled over \$2,700 to the ton were brought to Calico the other day to be stored away in a safe place. The prospects of the mine continue as bright as ever.

Messrs. E. Stacy & Co. have leased the Mark Twain mine and have several men employed in opening it up. Sinclair's mill is ready for the machinery, which is expected to arrive in a few days from Los Angeles. It will not take long to put it in place so that it is probable the mill will be ready for operation in about three weeks. All the principle mines in the camp are looking well, and are employing their usual number of men and producing their usual quantities of ore.

Sierra.

CLEANUP.—Mountain *Messenger*, April 10: The Bald Mountain Extension Co. Sunday cleaned up 143 ozs., averaging \$2 25 per carload. J. Hauber, of Alleghany, had a cave in his tunnel, recently, that caused a stoppage of work. He has a good ledge. Seventy-nine ozs. of gold was the Ruby cleanup last week, and for the one previous, eighty-one. The main tunnel of the Rainbow is in 900 ft. The rock is not hard, and about 40 ft a week is easily made. A seven-ounce specimen was found Monday at the Ruby, by Supt. Colman.

THE RUBY MINE.—Sierra *Tribune*, April 10: Fifty-two men are employed at the Ruby mine at present. The bedrock throughout the mine is very hard, necessitating blasting. Six gangways and four breasts are opened out. The latter number will be increased soon. Most of the gravel taken out has to be hoisted by windlass up an incline forty-two ft. Two pumps set in the main tunnel drain the incline. These are worked by boys. Week before last the caving of an old breast increased the flow of water, and for three days and nights men were kept constantly at the pumps in order to keep the incline from being flooded. The ventilation throughout the mine is splendid. Two weeks ago 81 ozs. of gold were cleaned up, and last week 79 ozs. was the result. The lead has recently changed its course to northeast. Taking into consideration the many difficulties under which work is being carried on at present, a great deal of credit is due Supt. Coleman for the fact that the mine is being made to produce more than expenses. The Bald Mountain Extension Co. cleaned up 143½ ozs. of gold Sunday, as the result of the past week's work in the South Fork ground. The main tunnel in the Extension mine is now going ahead by day work. This winter F. J. Hauber has been engaged in running a lower tunnel on his ledge near Alleghany. During the last storm the tunnel caved and he was forced to abandon work in that quarter for a short time. In the meantime he has been crosscutting the ledge on the surface in various places. The ledge averages about six ft in width and prospects splendidly.

Shasta.

LUCKY ESCAPE.—Shasta *Courier*, April 12: Last Wednesday, as Mr. Sharp, a workman in the Iron Mountain Mine, was standing on the hoisting cage the pin which held the windlass stationary gave way and the cage dropped to the bottom of the shaft, a distance of over 100 ft. The miner was hoisted out considerably bruised and badly shaken up, but we are informed that his injuries are such as he will re-

cover from. Some months ago Sharp was caught in a cave in the same mine and one of his legs broken.

Trinity.

QUARTZ EXCITEMENT.—Trinity *Journal*, April 13: Two ledges have been discovered on the Wes, Weaver, about a mile from town, within a few days from each of which good prospects have been obtained. On Tuesday the entire hillside there was covered with white-shirt prospectors from town and it is likely the fever would have continued for several days if the rain had not interfered. As it is a large number are only waiting for a clear day to resume the hunt for extensions and new lodes. West Weaver was originally a very rich stream and all the gulches putting into it on the west side paid well in quartz gold up to a certain height above which nothing could be found. Large pieces of rich quartz were found by the early placer miners, from one of which about \$700 was taken, and it has always been a firm conviction with those acquainted with the section that some day a rich ledge was certain to be discovered there. The new prospect was found in the bed-rock of a placer claim, some 30 ft below the surface, and as the lode is well defined, good sized, and prospects rich, there is a reason to expect that it will prove a veritable bonanza. The indications are most encouraging.

NEVADA.

Washoe District.

ALTA.—Virginia *Enterprise*, April 12: The east drift on the 2100 level has probably 130 ft yet to go to get under the point where the vein should be found. The ground continues of a favorable character, and there has of late been no special increase of water.

GOULD AND CURRY.—The drift on the 2700 level is being pushed forward as rapidly as possible though the heat still continues great in spite of the blowers. On the 2200 level the drift from the Bonner shaft is making good headway toward the Con. Virginia line. At this point it will be taken by J. P. Jones and others, who will proceed to mine the California and Con. Virginia upper levels for low grade ore.

UTAH.—The fan is running all right at the new station on the 1950 level and at a point 200 ft north of the main incline a north drift has been started which is showing some very promising streaks of quartz.

MEXICAN.—The engine is in place at the winze on the 3100 level and good headway is being made in sinking. Thus far the formation encountered is vein material, with some streaks of quartz.

SIERRA NEVADA.—On the 3100 level a west crosscut has been started at a point 80 ft north of the winze, and is cutting vein material showing some fair streaks of quartz.

BEST AND BELCHER.—The drift on the 2700 level is being pushed as rapidly as possible, but the ground is still quite hot, and will probably continue so until connection is made, though air is carried in by means of pipes of large size.

HALE AND NORCROSS.—The south drift on the 2800 level has connected with the main west drift from the Combination shaft and the two drifts are now being properly enlarged and timbered up, a work which will soon be completed.

COMBINATION SHAFT.—The west drift on the 2800 level has connected with the southeast drift from the Hale and Norcross and the connection is now being enlarged to its full size and properly timbered up.

OPHUR.—On the 150 and 250 levels are extracting ore and are at the same time pushing crosscuts in various directions; also an upraise is being made on the 250 level.

UNION CON.—The water is being allowed to drain from the several drift holes in the ends of the drifts on the 3100 level and a west crosscut will soon be started.

CALIFORNIA.—The east drift on the 2700 level, joint with Con. Virginia is being pushed as rapidly as possible in ground that works very well.

CON. VIRGINIA.—On the 2700 level the east drift joint with California is being pushed as rapidly as possible and in ground that works very well.

YELLOW JACKET.—The old upper levels continue to yield about the same quantity of ore, and the mills are kept steadily running.

BELCHER.—The several drifts on the old upper levels continue to yield well, and the mills are all kept going.

ANDES.—The usual prospecting work is being done, and some ore is being taken out that will pay for milling.

IMPERIAL.—Some ore that will pay for working is being found in the explorations on the old upper levels.

CROWN POINT.—The usual amount of ore is being extracted and all the mills are running regularly.

SAVAGE.—There is still a considerable flow of water from the north drift on the 2600 level.

UNION SHAFT.—Are repairing the drain drift leading out to the Sutor tunnel on the 1600 level.

Columbus District.

MOUNT DIABLO.—True *Fisura*, April 12: Winze No. 5 is now down 135 ft, and show no change of note. The south crosscut from the Callison winze, the intermediate between the second and third levels is in 44 ft and shows ledge matter in the face. The upraise from the third level has been connected with the winze from the second level and this completes the incline to the third level. A station is now being cut out for a dump on the third level. Below the third level the incline has been sunk 15 ft, the total depth below third level being 62 ft.

COLUMBUS CON.—The west drift, from the winze on the second adit level, has attained a length of about 20 ft, and a quantity of high grade ore is being extracted from the same. The work in crosscut No. 2, from the main drift on the 150 level, has been resumed, its present length being 35 ft. No work is being done on the first level at present.

ORE.—True *Fisura*, April 8: It is reported that the lower mill at Belleville will soon be started on a lot of 3,000 tons of ore from Mono county. A. G. McAfee has been prospecting in the Blue Light copper mine for the past two months. This is the same mine which furnished the ore that was smelted at Soda Springs about a year ago, when operations were suspended for want of sufficient ore. Mr. Mc-

Mee is employing five men and has already developed one small, but fine looking body of ore. The larger and better deposit which pinched out is being drifted for, and present appearances would indicate its being found again at an early date. The situation at present is very flattering, as spoken of by the Superintendent, and everything points to the resumption of smelting early in the coming summer.

Bristol District.

DAY.—Pioche Record, April 5: The ore lately encountered in the Day is of better class than has been found in the mine for a long time. The new find was made in a drift being run to the east on the fourth level, following up a small, flat seam of crystallized carbonate ore. The find is a virgin ground. After following the seam a short distance, it turned up, and has been upraised on for 51 feet. The width or extent of the body is not known. The crystallized carbonate, at one point, has been dug into for 15 ft. The assays of this went from \$47 to \$628 in silver, from 8 to 73 per cent in lead, and from 5 to 27½ per cent copper. At the top of the upraise the iron ore has commenced appearing, and is most likely the top of the ore chamber. This ore can be extracted at a cost not to exceed 50 cents per ton. A chamber of high-grade ore cannot be too large in its dimensions.

Highland District.

HAMBURG.—Pioche Record, April 5: The old abandoned Hamburg, of Highland district, now the property of the Day Company, has improved greatly the past week. The large flat ledge of low-grade rock that has been run on for some time has taken a change. The miners have arrived at a point where a part of the ledge shows upwards, while the other keeps on and has a downward tendency. A box of nice-looking ore, some of the pieces being composed mostly of galena, was brought to town on Wednesday. It was said to have been an averaged sample, and would go \$80 in silver. It is believed by the miners that the ledge is making a large deposit of ore near by. At the Mendha mine the allotted amount of ore is daily extracted, and the ore body continues looking healthy, and exhibits no signs of weakening.

Mount Cory District.

CROPPING.—Walker Lake Bulletin, April 12: Work on the Junio tunnel has been suspended for a few days on account of the illness of the foreman. Supt. Shafer reports a cave in the Enterprise tunnel, which will delay work about a week. Coryville is getting on its good clothes. The snow is nearly gone and the green grass is beginning to show. At present the only tunnel at work is the Josephine, but they will all be under headway again in a short time.

Oseola District.

WATER RIGHTS.—Eureka Sentinel, April 8: We have it on good authority that Godbe & Hampton, of Salt Lake, have been trying to purchase from the Oseola Company the water rights which the latter have obtained for about \$25,000, with the view of extending their purchases of small-water courses and bringing them into Oseola on the extensive placers that now exist. As to the success of Godbe & Hampton we have not been apprised. It is uncertain whether the present holders of the water rights want to get more than the \$25,000 they have paid out for them and were only waiting for a bargain, or whether they intend to utilize their rights for themselves. Our informant states, however, that the bringing of the water into the camp for sluicing is only a question of time, for, he says, though the quartz mines in the camp show well, the placers are certainly rich and extensive, as the working of a few men in a small way for years has proved beyond a doubt.

Pioche District.

MEADOW VALLEY.—Pioche Record, April 5: The Meadow valley property was sold on Monday, J. Eisenmann purchasing the mine, consisting of 1,800 ft of mining ground, and the works, while W. E. Griffin bought the mill and the millsite.

Rebel Creek District.

NEW COMPANY.—Eureka Sentinel, April 14: Several Eureka men are interested in mines in Rebel creek district, or, as they are commonly called the Willow creek mines. They have incorporated under the name of The Mayon Mining Company. Monday last, at a meeting of the stockholders and trustees, A. L. Fitzgerald was chosen President; P. N. Hansen, Vice President; W. O. Mills, Jr., Secretary and Treasurer, and William Mayon, Supt. The company owns five locations near Willow creek, which promises exceedingly well, though as yet undeveloped. Several very rich specimens have been taken from them. The company intends to go systematically to work on a prudent basis and develop their property, and, if the results are as anticipated, they will soon have a splendid paying investment. In about two weeks Mr. Mayon will commence operations. This is a company that means business, and we are satisfied that Mr. Mayon, Supt., is as good a man to put in charge as could have been selected. We hear good accounts of Willow creek, and we hope soon to hear that the Eureka investors are in bonanza.

White Pine District.

Work for the time being is partially suspended on many of our prospecting claims, for the reason that provisions and material cannot be got to them, and some of them fill up with snow as fast as cleaned out. Mr. Kendall's force is laid off now for that reason. We look for a revival of mining and business interests here as soon as the spring fairly opens, and the snow gives our people a show to move about.

ARIZONA.

MOHAVE ITEMS.—Miner, April 5: James Carr, the boss freighter of Arizona, has taken a contract to haul ore from the McCracken mine to the mill at Signal. The road engine is still at work hauling rock for the purpose of macadamizing the road which will take some months yet. The Lester Mining Company's mill at Signal will start up for good about the first of May. P. F. Collins is about to commence work on one of his claims near the Moss line in San Francisco district. He will start out in a few days. From A. E. Davis who has just returned from a visit to the Elkhart and Schuykill mines at Chloride we learn that everything is progressing favorably and the ledges looking well.

PINAL NOTES.—Drill, April 5: The clear open sky that now smiles upon us has revived activity and enterprise in the Territory and the temporary suspense of business promises to be of but short duration.

The Windsor mill is now in the hands of the Silver King Company and active renovation is going on under the charge of Chief Engineer Kenney. It will soon be in apple pie order and of use in profitable work. Mr. Wheeler has closed his work on the "Eureka." He has a large quantity of ore on the dump, but as the Windsor mill was leased to the Silver King Company he has no chance to work and therefore shut down. The mine looks vastly better than formerly. In the depths of the Mowry they are still exploring and persevering with a most admirable pluck. The "Lost Prize" is still holding out its silvery rays from Treasure in the deep. Prospectors are becoming active and the burro with its pack is seen frequently over the trails. Silver King is lively and full of miners who are daily thriving amongst the rocks, and many a prospect shows the nearer approach to fortune with the work done around the King. There are some hopes of the "Goodenough" Company being revived and active. At Owl Head the Jessie Benton mill is running steadily. The machinery for the "Speciepaying" will now soon reach the mill at Cottonwood.

HASSAYAMPA.—Prescott Courier, April 11: R. W. C. Merington, of the Senator mill, Hassayampa district, and Jacob Gattoni, of the "Bonanza" Grigione mine, reached Prescott, yesterday, and shortly afterwards found their way to the Courier office and let us look at large pieces of ore from the aforesaid mine, which is about one mile east of the Dosoris. The ore is of a bluish cast; carries between \$200 and \$300 per ton in silver; also, \$40 in gold. The mine was recently found. It is situated so that short tunnels strike it, several hundred feet below the surface. The ore will be sacked and shipped. The gentleman who has leased the Holmesite mine has taken out 20 tons of second class ore, which, we learn, assays at the rate of \$325 per ton. He has, also, about four tons of first-class ore, which will yield upwards of \$5,000 per ton. The Holmesite belongs to John Holmes. Mr. Mahoney, of Placerville, tells us that miners on Hassayampa creek are doing remarkably well, as are those in Weaver district and in Copper Basin.

THE LANE DISTRICT.—Arizona Miner, April 11: In mining circles the above-named district is being prominently mentioned as being destined to enjoy an early and lasting boom. From reliable parties who have recently visited the section we glean the following: The Black Warrior is at present down 200 ft, with its north drift in 450 ft. It is being constantly worked, with high grade ore everywhere in sight and never was more promising in appearance. Northern Pacific has one shaft down 50 ft, and work is being done on a 100 foot shaft from which drifts will be run each way. The Hayden Bond is down 100 ft with drifting going on, and over 400 tons of ore on the dump. Work is being done on roads leading from these mines to the Tuscania mill, by which the ore will be worked as soon as transportation can be had, and over 150 men will then find in the district constant and profitable employment.

COLORADO.

NOTES.—Gorogtown Courier, April 12: The total shipment of ore from Gorogtown during March, was \$100,787.95. Work has been started up on the Michigan tunnel, just below the Shively mine. Shay & Co. shipped three car loads of ore from the Mendota last week, and Hood & Co. shipped three. Barrett & Fletcher are running 20 stamps in their mill at Empire, on ore that averages about \$50 a cord. Mr. R. O. Old has leased the Frostburg lode to Hambly & Co., who are at present engaged in driving the adit. The Victoria tunnel, run to cut the Mendota and other lodes, is now in 506 ft, and will cut the Mendota in about 300 ft, at a depth of 450 ft. The tunnel was driven 80½ ft during March. The Albino mine, at Damont, shipped 12 tons of smelting ore last Saturday, and shipped 47 tons during the month of March. A good vein is exposed at the bottom of the shaft, and 21 inches in the breast of the lower level. Nine cars of ore were shipped from the Mendota last month, the net weight of which was 90 tons 833 pounds. Gross value, \$6,631. Four cars, or about 40 tons, were shipped last week, valued at \$3,500, making a total output from the Mendota during March, of over 130 tons, and a gross value of over \$10,000. Okham & Co., lessees on the Joe Reynolds No. 2, had quite a large mill-run last Saturday, the 1st class of which returned 491 ounces, 2d class 300 ounces and 3d class 140 ounces per ton. The ore came from the lower level, 90 ft from the surface. A mill-run of \$1,881 from No. 1, of ore was taken from 900 ft from the surface, shows the ore to be of uniform high grade: 1st class 360 ounces, 2d class 155 ounces.

IDAHO.

VIENNA.—Ketchum Keystone, April 5: It is said that the Vienna Mining mill company, at Vienna, employ about 100 men on their mines and mill. The wages paid that number of men, a portion of them working every day in the week, will amount to at least \$25,000 per week. The cost of timbers in the mines added to the cost of wood consumed by the mill—seven cords daily at \$3.50—will amount to about \$240 per week. The cost of transporting ore from the mine to the mill averages \$1.75 per ton, and as the mill by ordinary operation will put through 20 tons daily the weekly expense of hauling amounts to \$352. Thus the cost of the entire mining and milling operation excepting the cost of chemicals, amounts to at least \$3,000 per week or over \$12,000 per month. This is the extent of a single winter operation in the Wood River country. It is now said that the Vienna company employs 20 additional men, making the weekly expenditure for labor about \$550 additional. The ore of the Vienna and Mountain King mines operated by this company is chiefly ruby-silver bearing.

MINNIE MOORE.—Wood River Times, April 9: Yesterday three carloads of Minnie Moore ore were shipped to Omaha. This was only one of the regular shipments from this famous mine, as the managers intend to ship a like amount daily for some time. The second payment will be due on the mine by the 20th instant, while the third payment will not fall due for some time; but it is probable that the purchasers of the mine will pay for it in full this month, as they are anxious to work it more energetically. By the contract of purchase, they cannot extract over thirty-five tons per day until the

second payment shall have been made, nor more than fifty tons per day, between the second and the third payments. The managers wish, however, to work the property vigorously, and in order to do so they will probably pay for it this month. If they do so, they will at once, it is stated, increase the force at work to a complement of 150 men.

HALF A MILLION.—For a day or two past rumors of the sale of the Idahoan mine for half a million dollars having been afloat on the street, a Times reporter asked Supt. Turner yesterday if the mine was really to go this time. Judge Turner said he did not know. Himself and partners had fixed a price on the property, and experts in the interest of the intending purchasers were examining the property. If it suited them they would doubtless buy, as they seemed to mean business. The Idahoan is one of our banner mines. Three years ago it was offered at \$100,000, but the party having the option having been too slow, when he offered to take the mine he was asked \$150,000. The following year \$250,000 was asked of Morton C. Fisher, who deliberated some months, and finally asked for a bond, which was refused. Last year some representatives of an English syndicate wanted it, but would not pay over \$350,000 for it, while the price asked was \$400,000. This year the figure is doubtless at least \$500,000, and the Idahoan, being undoubtedly a mine, is cheap at the price.

THERE IS GOLD.—Coeur d'Alene Nugget, April 5: The assertion is frequently made by croakers that no disinterested party has ever had any proofs that gold came out of the Coeur d'Alene mines. In future we shall brand such statements as falsehoods. We were present last week when George B. Ives cleaned up his sluices after a two days' run. A strip of ground, or pit, about 10 by 15 ft had been partially cleaned. The work had not been finished, as much loose dirt still covered the bed-rock, and the crevices of the rock had not been dug out. At our request, however, Mr. Ives consented to make a partial cleanup. We had asked Mr. Ives as we watched him shoveling the dirt into the sluices, if a shovelful or pan of dirt would show a color. He looked up with an amused smile and said: "I guess I can do better by you than that. Come down here?" We descended into the pit from which he had been shoveling. He took a small pail and dipping up water poured it upon the bed-rock where they were working, and washed away the loose dirt. In the crevices, numbers of pieces of gold were found, the largest being worth a dollar, and two others half a dollar each. One of these specimens can be seen at the Nugget office. After seeing such an exhibition of the paying qualities of the dirt, we asked to see the cleanup. Two men had worked two days. The upper and lower riffles in the string of sluices were not disturbed, and no attempt was made to clean all the gold from the sluices. It was only a partial cleanup, but the result was \$74.25, or \$18.55½ per day to the man. We saw the gold taken from the boxes, panned out, dried, cleaned and weighed. One piece was weighed which was worth \$1.25, and numbers of other pieces were nearly as heavy. It was all very coarse. Mr. Ives says that the largest nugget ever found on his claim was worth \$2.50, the nugget being, as a rule, much smaller than those found in other claims. The first panful of dirt taken from the bed-rock by Mr. Ives, on the ground abandoned by the Californians, yielded 25 cents. Lou Wyant tried a panful with the same success. A discussion arose as to whether the gold came out of the gulch, or had been washed from a bar further up the creek. Mr. Ives inclined to the latter theory and his claim now includes the greater part of the bar. Last season he dug a ditch some 200 rods in length and sluiced off a pit about 14 by 75 ft. There was not sufficient water to ground sluice the waste dirt off to advantage, and he did not make wages. From the pit he took out \$400. It was on the rimrock between the bar and the channel of the creek. The rimrock paid better the lower down he got in the channel. On the opposite side of the creek, on the rimrock, Mr. Ives saw three men pan out \$50 in one day. The channel is about 30 ft wide, and the bed-rock lies about five or six ft from the surface. Mr. Ives will work out the channel this summer. He thinks he can drain the bedrock in the bottom of the creek by digging a 500-foot ditch. If fall enough is not obtained in this distance, he will have to go 630 ft. He does not believe the ancient channel is identical with the present bed of the creek, but thinks it is back under the bar. He is careful not to wash any dirt or tailings into the creek, however, as he is confident the present channel is exceedingly rich. He does not wish to sell his claim, saying that he has mined 20 years and now has found a claim that he is willing to settle down upon and work at his leisure. Parties ask him every day to place a price upon his claim. The invariable reply is: "Blanket it with ten dollar notes and I'll take the blanket." He does not intend to ground sluice the waste dirt, because his dump will cover up valuable ground. He will drift, instead, only take out the pay-dirt. By doing so, he can work all winter, and take the gold from every foot of his ground. He is indifferent regarding the rush to the mines, and would not care a straw if a stampede should occur. He is interested in no boom, and the favors shown us were simply acts of courtesy, without any reference to what would be written for or against his mine.

THE STATUS OF THE MINES.—Coeur d'Alene Nugget, April 5: The warm weather and rapidly melting snow has set the miners and prospectors at work in real earnest. Picks and shovels are being called into lively requisition, and miners can be seen panning dirt at many a turn of the creek, rockers and sluices are busy, and considerable dirt is being washed. The towns are comparatively deserted, but the claims are becoming peopled with men. Cleanups have been made, but while the results are evidently of a satisfactory nature, it is difficult to get figures and exact amounts on account of the many disputed titles to claims. Enough is whispered about the camp, however, to show that the beginning is better than the miners generally anticipated. In any claim parties will lend a person a shovel or pan, and with either gold can be shown. It is generally coarse shot gold, with frequent nuggets, and exists not only on the bed-rock but in the gravel for a foot or two above bed-rock. We have been careful not to write this heretofore, because we wished to see with our own eyes. Only a few of the claims are opened up, but those few, without a single exception, so far as our knowledge extends, are prospecting well. That there is pay dirt here is an undisputable fact. How much of it, or rather, how much of the

district it covers, is a question for the future. Gold is being brought in and sold every day in small quantities. It will be a month before the work of mining will have fairly commenced, though work is now being prosecuted on a large number of claims, and others are being prospected. April will see the ground cleared of snow. May will see lines of sluices laid and miles of ditches cut. June, July and August will tell the story. It is nonsense to run the camp down, as some of our outside contemporaries are doing; it is criminal to write it up, to boom it, as the Northern Pacific and a few subsidized papers are doing. The man does not live who can say he knows of his own knowledge that the district is not the richest ever discovered. On the other hand, no one can pretend to know that the amount of gold to be taken out will be anything like adequate to the excitement. The Nugget will denounce the mines as soon as there is anything to warrant such a course. It will give facts, however glowing, when they are clearly substantial. Our readers can depend upon a fair, honest statement of the case. When we see ounces of good solid dust, as we have on many occasions, and have proof that it came from certain ground, it is difficult to keep from enthusing. But we remember that such gold may be found in only a few places, and that thousands who come here will be financially ruined if they are misled, and we curb our enthusiasm and patiently await developments.

MONTANA.

THE MARIA MINE.—Butte Miner, April 9: Recent developments in this mine have proved it to be one of the best mining properties in the district. The Maria is situated one-half mile north of the Alice. Its owners, the Larmour Brothers, have been quickly working the property for years, feeling assured they had a veritable bonanza within their reach. At present the property is under lease to Frank Pink & Co., until the first of August next. During the winter the output has run from 100 ounces to 119 ounces. Quite recently, however, in stopping from the 125 level to the 75 level the lessees struck a body of ore of extraordinary richness. The returns from the Colorado smelter of a lot of 17 and one-half tons of first-class ore just smelted there showed 284 ounces silver to the ton, and 52½ second-class ran 85 ounces. A contract has been entered into for the erection of a 10 stamp mill, with roaster, on the property adjoining the Maria on the east. The mill will be built by English capitalists.

WARM SPRING MINES.—Coeur d'Alene Northwest, April 8: I visited the new diggings yesterday called the Cella Gordon mining district. There are quite a number of people there, and about 40 locations have been made. The project of taking claims on the 20 acre plan was not consummated. The laws of the district allow each location but 225 ft from rim to rim rock. The claims taken are mostly below the Falls. There are but few claims taken above—four in all I believe. Next Saturday (April 12th) is representation day. All claimants are expected there then to represent, and it seems after that time all claims not represented are "jumpable." They have commenced a ditch two ft wide, about same depth, and have completed 220 ft. It seems there must be something there or they would not go on with the ditch.

UTAH.

REVIEW.—Salt Lake Tribune, April 11: The week has been a quiet one in mining circles, notwithstanding the somewhat settled weather and the apparently swift oncoming of spring. The receipts of the week amounted to \$101,663.52 in bullion and \$5,000 of ore; total, \$106,663.52. For the week previous the receipts were \$121,275.92, of which \$112,455.92 was bullion. The shipments from Salt Lake City for the week ending April 5th, inclusive, were 998,136 pounds. The shipments of Horn Silver for the week were 13 cars of bullion, valued at \$39,000, bringing the total product of the Horn Silver to date for the previous year, \$570,000. The Ontario shipped during the week 32 bars of bullion, \$37,333.32; total, for 1884 to date, \$465,903.10. The Crescent sent down for the week, three lots of ore aggregating in value \$5,000, being all the ore received. The Stormont forwarded three bars of silver, \$4,630. The product of the Hanauer smelter for the week was ten cars of bullion, \$20,700. During the winter much development work was done at the lead mine, Bingham, and some first-class ore was shipped, but most of the time the heavy snows prevented operating the tramway, and the concentrating mill was idle. To-day the mill will commence its season's work, under more favorable auspices than ever before. In the mine large ore bodies are in sight, and of better quality than that taken out last season. The mine and mill have a full force of men, and everything looks promising for a larger output than heretofore in the history of the mine.

OREGON.

NOTES.—Jacksonville Times, April 11: Water is decreasing fast and most of the miners are engaged in cleaning up. Ingram & Dean, of Willow Springs, commenced cleaning up this week, having washed off a considerable amount of ground. Keaton & Klippel, of Poorman's creek, are able to pipe three hours a day with the aid of their reservoir. A number of other miners are also doing some work through reservoirs. M. Hoover, of Jackson creek, has struck unusually good prospects, and he is of the opinion that he has found the old channel which paid so enormously in former days. There is a large amount of snow at the head of the Sterling Co.'s ditch, which is slowly melting and affording a good supply of water. Supt. Ennis expects to make a several months' run. The season has been considerably of a failure for many of the miners, owing to the scarcity of water. Some of those who rely on the rains altogether have been able to make a short run, but generally they have been disappointed, we are sorry to say. The enterprise inaugurated by Messrs. Simmons, Ennis & Cameron, near Waldo, is progressing satisfactorily, and we expect to announce before very long that they have commenced mining operations. They are not employing as many men as usual, the force of the water cutting a channel in good shape.
